			Board of Forestry: ADEC's ability to determine the effectiveness of the [Forest Resources Practices Act] in protecting water quality and fish habitat on private and state lands was significantly compromised in the 1993 to 1998 field seasons... and remain unchanged for 1999... ADEC's staffing limitations have resulted in only limited forest practices inspections and monitoring which has significantly compromised ADEC's water quality role envisioned by the FRPA and the Regulations. p. 6.		
McKenzie Inlet 10103-002	Timber harvest, road construction, & effectiveness of riparian buffers - sediment?	SEACC	Ketchikan residents have reported impairment of water quality on southeastern Prince of Wales Island near logged areas surrounding Dora Bay, Kitkun Bay (both on Cholmondeley sound), McKenzie Inlet (off Skowl Arm) and Tolstoi Bay (on the north side of the Kasaan peninsula). Non-point source pollution from logging and road building activities on these and other private lands raise serious questions as to the effectiveness of state riparian standards for private lands in providing for long-term protection of fish habitat on private lands. Nearly ten years after passage of the revised Forest Resources Practices Act, the state lacks credible data to support conclusions that logging-related activities on private land comply with Alaska water quality standards and protect designated uses of affected fresh and marine waters. Our position is confirmed by DEC's recent monitoring report to the Board of Forestry: ADEC's ability to determine the effectiveness of the [Forest Resources Practices Act] in protecting water quality and fish habitat on private and state lands was significantly compromised in the 1993 to 1998 field seasons... and remain unchanged for 1999... ADEC's staffing limitations have	• Needs follow-up and more assessment information and data gathering and evaluation by professional(s) • No file on this waterbody exists (in the program office), a file will be opened on this water • Little or no hard data to our knowledge exists for this waterbody	An "open" file has been created on this water Entered into ADB, use support/impairment "not assessed" at this time Conduct follow-up information/data gathering
