February 13, 2004 Site Visit
Sheldon Jackson College Soil Stockpiles

Approximately 2,000 cubic yards of petroleum-contaminated soil excavated during summer 2003 utility upgrades. Source(s) are presently unknown.

Photo on top left is the main soil stockpile in the center of the campus, approximately 1,000 cubic yards. Smaller stockpiles scattered in various locations around campus. All stockpiles lined and well covered.

Bottom photo shows the Hames PE Center parking lot where material may eventually be graded out and capped with asphalt.

Fred Knowles, SJ College, and Jim Clare, consulting engineer, were present during site visit.

August 24 Site Visit Update – Photos at bottom right show the final location of the new parking lot with the contaminated soil encapsulated below the asphalt. Arrow between the two photos shows the same tree.
