The sewer can be discharged from either side of the vessel, useful if the vessel is laying at a dock. Only one MSD. We have separate graywater and sewer discharge points. We combine them on the outside of the vessel if we are discharging to a dock. So that nothing goes into the water and we only have one line going to the dock.

Hello John,

I just looked it over and I have a couple questions.

- The NOI says that graywater is combined with MSD effluent prior to discharge, but it looks like on the line drawing there are separate discharge points for graywater discharge and sewer discharge. Can you clarify?

- I see there are two sewer discharge points on the line drawing. Do you have two MSDs on the vessel with their own discharge points?

Morning Anne,

Did my line drawing work?

Thanks,
John
