## **EXECUTIVE SUMMARY**

This 2018 Annual Monitoring Plan describes the Alaska air quality monitoring network under the Alaska's Department of Environmental Conservation (DEC) oversight and spells out anticipated changes to the network for the calendar year 2019.

Most of the air monitoring activities are focused on population centers and areas that have shown in the past to have air quality problems. Due to budget cuts over the past several years DEC has reduced the ambient monitoring network to include mostly only regulatory required sites. Looking ahead, DEC does not expect to be extending the network significantly during the next five years due to fiscal constraints.

DEC will discontinue the ozone monitoring in the Anchorage MSA, which means the ozone site in Palmer will be dismantled. DEC anticipates operations in July 1, 2018 for the new Special Purpose Monitoring (SPM) site for PM<sub>2.5</sub> and PM<sub>10</sub> in Bethel.

# **1** INTRODUCTION

The Code of Federal Regulations (CFR) Title 40 §58.10 requires each state agency to adopt and submit to the U.S. Environmental Protection Agency (EPA) Regional Administrator an annual monitoring network plan which shall provide for the establishment and maintenance of an air quality surveillance system that consists of a network made up of the following types of monitoring stations:

• State and local air monitoring stations (SLAMS) including monitors that are designated as:

- o Federal Reference Method (FRM), or
- o Federal Equivalent Method (FEM)
- National Core Multi-pollutant Monitoring Stations (NCore)
- PM<sub>2.5</sub> Chemical Speciation Network (CSN), and
- Special Purpose Monitoring (SPM) stations.

The plan shall include a statement of purposes for each monitor and evidence that siting and operation of each monitor meets the requirements of appendices A, C, D, and E of 40 CFR 58 where applicable.

The annual monitoring network plan must be made available for public inspection for at least 30 days prior to submission to EPA. Any annual monitoring network plan that proposes SLAMS network modifications, including new monitoring sites, is subject to the approval of the EPA Regional Administrator, who shall provide opportunity for public comment and shall approve or disapprove the plan and schedule within 120 days. If the State or local agency has already provided a public comment opportunity on its plan and has made no changes subsequent to that comment opportunity, and has submitted the received comments together with the plan, the Regional Administrator is not required to provide a separate opportunity for comment.

This 2018 Annual Monitoring Plan describes the Alaska air quality monitoring network under the State's oversight and spells out anticipated changes to the network for the calendar year 2019. This plan shall include all required stations to be operational by January 1, 2019. Specific locations for the required monitors shall be included in the annual network plan which is due to be submitted to the EPA Regional Administrator by July 1, 2018.

The annual monitoring network plan must contain the following information for each existing and proposed site:

- 1. The AQS site identification number,
- 2. The location, including street address and geographical coordinates,
- 3. The sampling and analysis method(s) for each measured parameter,
- 4. The operating schedules for each monitor,
- 5. Any proposals to remove or move a monitoring station within a period of 18 months following plan submittal,

- 6. The minimum monitoring requirements for spatial scale of representativeness for each monitor as defined in 40 CFR 58, Appendix D,
- 7. The minimum monitoring requirements for probe and monitoring path siting criteria as defined in 40 CFR 58, Appendix E,
- 8. The identification of any sites that are suitable and sites that are not suitable for comparison against the annual  $PM_{2.5}$  NAAQS as described in 40 CFR 58.30,
- 9. The Metropolitan Statistical Area, Core-Based Statistical Area, Combined Statistical Area or other area represented by the monitor,
- 10. The designation of any lead monitors as either source-oriented or non-source-oriented according to 40 CFR 58, Appendix D,
- 11. Any source-oriented monitors for which a waiver has been requested or granted by the EPA Regional Administrator as allowed for under paragraph 4.5(a)(ii) of 40 CFR 58, Appendix D,
- 12. Any source-oriented or non-source-oriented site for which a waiver has been requested or granted by the EPA Regional Administrator for the use of Pb-PM<sub>10</sub> monitoring in lieu of lead total suspended particulate (Pb-TSP) monitoring as allowed for under paragraph 2.10 of 40 CFR 58, Appendix C.

# 2 AIR QUALITY MONITORING PRIORITIES

In 1970 the Congress of the United States created the U.S. Environmental Protection Agency (EPA) and promulgated the Clean Air Act (CAA). Title I of the CAA established National Ambient Air Quality Standards (NAAQS) to protect public health. NAAQS were developed for six *criteria pollutants*: particulate matter (PM), sulfur dioxide (SO<sub>2</sub>), nitrogen dioxide (NO<sub>2</sub>), carbon monoxide (CO), ozone (O<sub>3</sub>), and lead (Pb). Particulate matter has two associated NAAQS: one for fine particulate matter less than 2.5 micrometers in aerodynamic diameter (PM<sub>2.5</sub>) and one for coarse particulate matter less than 10 micrometers in aerodynamic diameter (PM<sub>10</sub>). Threshold limits established under the NAAQS to protect the most sensitive of the human population, including those people with existing respiratory or other chronic health conditions, children, and the elderly. Secondary standards established under the NAAQS are to protect the public welfare and the environment. Since promulgation of the original CAA, the EPA has continued to revise the NAAQS based on its assessment of national air quality trends and on current (and ongoing) health studies.

To protect public health and assess attainment with NAAQS, DEC established an air quality monitoring program. The State of Alaska has a large geographical area with a small population. Anchorage and the Matanuska-Susitna (Mat-Su) Valley have the bulk of the 710,231<sup>1</sup> residents in the state, about 54% of the overall population. The remainder of the population is distributed among the cities of Juneau and Fairbanks with populations of about 30,000-40,000 and many

<sup>&</sup>lt;sup>1</sup> Population data obtained from the 2010 US Census, <u>http://live.laborstats.alaska.gov/cen/dp.cfm</u>

scattered and isolated small villages, most of which are off the road system and have populations ranging from 16 to 10,000 people. The total area of the state is approximately 665,384 square miles (1.7 million square kilometers)<sup>2</sup>.

In accordance with the National Monitoring Strategy, DEC plans air monitoring activities using the following criteria:

- Monitor in larger communities to cover the largest possible population exposure;
- Monitor in designated smaller towns and villages that are representative of multiple communities in a region; and
- Monitor in response to air quality concerns.

The Air Monitoring & Quality Assurance (AMQA) program of the DEC Air Quality Division has a relatively small staff of professionals who conduct the State's air quality assessment efforts. To enhance the quality of work performed statewide, DEC's staff works closely with the Municipality of Anchorage (MOA), the Fairbanks North Star Borough (FNSB), the Matanuska-Susitna Borough, the City & Borough of Juneau (CBJ), and environmental staff in other, smaller communities to assess air quality levels statewide. To continue to protect public health and the environment, air quality monitoring is focused on seven primary issues by descending priority:

- 1. Fine particulate matter (PM<sub>2.5</sub>) monitoring
- 2. Coarse particulate matter  $(PM_{10})$  monitoring
- 3. Wildland fire monitoring (PM<sub>2.5</sub>)
- 4. Carbon monoxide (CO) monitoring
- 5. Rural communities and tribal village monitoring (primarily  $PM_{10}$ )
- 6. Lead (Pb) monitoring
- 7. Ozone (O<sub>3</sub>) monitoring

# **3** STATE OF ALASKA AMBIENT AIR MONITORING NETWORK

### 3.1 Minimum Monitoring Requirements

Minimum monitoring requirements are based on several factors including pollutant levels and populations in statistically defined metropolitan areas. The definitions for the statistical based metropolitan areas are provided by the US Office of Management and Budget (OMB) and the Census Bureau (Census).

Alaska has four statistical areas as designated by OMB in 2009 which boundaries are based on the 2013 Census data<sup>3</sup>. The four Core Based Statistical Areas (CBSA) include two Metropolitan

<sup>&</sup>lt;sup>2</sup> <u>https://www.census.gov/geo/reference/state-area.html#n1</u>

<sup>&</sup>lt;sup>3</sup> https://www2.census.gov/geo/maps/metroarea/stcbsa\_pg/Feb2013/cbsa2013\_AK.pdf

Statistical Areas (MSA) and two Micropolitan Areas ( $\mu$ SA), see Table 3-1 below. The two MSAs are the Anchorage MSA which includes the entire Municipality of Anchorage and the entire Matanuska-Susitna Borough. The Fairbanks MSA is comprised of the Fairbanks North Star Borough. The two Micropolitan Areas are the Juneau µSA and the Ketchikan µSA, which encompass the City and Borough of Juneau and the Ketchikan Gateway Borough, respectively.

Fable 3-1: Alaska's Core Based Statistical Areas									
Core Based	<b>Population</b> *	Includes:							
Statistical Areas									
Anchorage, MSA	380,821	Municipality of Anchorage	291,826						
		Matanuska- Susitna Borough	88,995						
Fairbanks, MSA	97,581								
Juneau, µSA	31,275	-							
Ketchikan, µSA	13,477	-							
*(based on 2010 Consus I	) ata)								

<sup>s</sup>(based on 2010 Census Data)

The minimum number of sites required for the Alaskan CBSAs for the six criteria pollutants are summarized for the Alaska network in Table 3-2. No monitoring is required for lead anywhere in the Alaskan CBSAs. No air quality monitoring sites are currently required for the Ketchikan μSA.

Monitoring in the Juneau µSA focusses on particulate matter monitoring. One monitoring site is required for PM<sub>10</sub> based on the PM<sub>10</sub> Limited Maintenance Plan. The Mendenhall Valley had been designated as a PM<sub>10</sub> non-attainment area and since has met the standard. No PM<sub>2.5</sub> monitoring site is required however a single semi-continuous PM<sub>2.5</sub> monitor is used to issue burn curtailments by the local government. A filter-based monitor is collocated with it to fulfill Network collocation requirements.

CO monitoring is required in the Anchorage and Fairbanks MSAs based on the Limited Maintenance Plans for the MSAs. Both areas had been previously designated as non-attainment and have been able to lower their concentrations.

The Anchorage MSA also triggered the PM<sub>10</sub> monitoring requirement of 3 to 4 monitors based on elevated concentrations in 2016 (see Table E-3). The exceedances result from high wind events that pick up dust from frozen but not snow-covered braided river beds occur semi regularly. DEC has flagged the events in AQS and has amassed relevant supporting evidence for exceptional event waiver requests. As EPA and the state are currently focused on PM2.5, DEC plans to prepare EEWRs for the events when EPA starts another PM<sub>10</sub> designation process and/or if EPA requests that DEC submit them for approval. Thus, DEC requests that exceptional events not be used to calculate minimum requirements for the Anchorage MSA and that the all sites be considered medium concentration. Table 3-2 excludes the Mat-Su 2016 high wind event.

There is currently no requirement for  $PM_{2.5}$  monitoring in the Anchorage MSA. The minimum requirement for  $PM_{2.5}$  monitoring in the Fairbanks MSA is for at least one monitoring site, based on the elevated concentrations measured in Fairbanks and North Pole.

Criteri	a Pollutant	SLAMS site requirement					
		Anchorage MSA	Fairbanks MSA	Juneau µSA	Ketchikan µSA		
DM	Most recent 3 year design value $\geq 85\%$ of NAAQS	1	1	0	0		
PM2.5	Most recent 3 year design value < 85% of NAAQS	0	0	0	0		
<b>PM</b> <sub>10</sub>		1-2*	0-1	0**	0		
Pb	Waiver for source oriented monitoring - see section 3.1.1	0	0	0	0		
СО	Two monitoring sites based on CO Limited Maintenance Plans (Fairbanks and Anchorage)	0	0	0	0		
0.	Most recent 3 year design value $\ge 85\%$ of NAAQS	0	0	0	0		
<b>O</b> <sub>3</sub>	Most recent 3 year design value < 85% of NAAQS	1	0	0	0		
SO <sub>2</sub>		0	0	0	0		
NO <sub>2</sub>		0	0	0	0		

Table 3-2: Minimum Monitoring Requirements for Alaskan CBSAs

\*Concentration is moderate with High Winds Exceptional events days removed

\*\*One (collocated) monitoring site based on  $PM_{10}$  Limited Maintenance Plan and to satisfy network collocation requirements

### 3.1.1 Lead

After consultation with EPA, DEC decided to pursue a modeling demonstration to show that lead concentrations at the ambient boundary of the Red Dog Mine meet the new lead standard. On August 11, 2016 EPA approved the State of Alaska's waiver request for lead monitoring at the Red Dog Mine based on the results of dispersion modeling. The results of the modeling showed that the maximum ambient air 3-month rolling average lead concentration at the mine did not exceed 50 percent of the lead NAAQS. Pursuant to 40 CFR Part 58, Appendix D, section 4.5(a)(ii), this waiver must be renewed every 5 years as part of the Alaska 5-year Air Monitoring Network Assessment. A copy of the EPA approval letter can be found at <a href="http://dec.alaska.gov/air/am/docs/red-dog-mine-lead-monitoring-waiver-letter-epa-08-11-16.pdf">http://dec.alaska.gov/air/am/docs/red-dog-mine-lead-monitoring-waiver-letter-epa-08-11-16.pdf</a>.

### 3.1.2 Appendix D & E Siting Forms

In 2014 EPA Region 10 provided network evaluation forms to determine compliance with design and minimum monitoring requirements for each of the criteria pollutants under 40 CFR 58, Appendix D. These evaluation forms were reviewed and updated, when necessary, in 2018 by DEC and are presented in **Appendix A**. In 2014 EPA Region 10 provided siting evaluation forms to determine compliance with siting requirements for each of the criteria pollutants under 40 CFR 58, Appendix E. These site evaluation forms were reviewed and updated, when necessary, in 2018 by DEC and are summarized by MSA in **Appendix B**.

### 3.2 Current Monitoring Sites

DEC operates and maintains a number of ambient air monitoring networks throughout the Alaska. Table 3-3 provides the site name, address, geographic coordinates, and identification number for all the air monitoring sites for which data are submitted to the EPA Air Quality System (AQS) database as of January 1, 2018. NCore parameters measured are PM<sub>10</sub>, PM<sub>2.5</sub>, PM<sub>10-2.5</sub>, CO, O<sub>3</sub>, SO<sub>2</sub>, NO<sub>2</sub>, NO, NOx, NOy, CSN and meteorological parameters.

Site Name/ Monitoring Objective	Address	Latitude/Longitude*	AQS Identification	Agency
Garden	3000 East 16 <sup>th</sup> Ave. Anchorage, AK	61.205861N 149.824602W	02-020-0018	DEC
Laurel	4335 Laurel St. Anchorage, AK	61.181312N 149.834083W	02-020- 0045	DEC
Parkgate	11723 Old Glenn Hwy. Eagle River, AK	61.326700N 149.569707W	02-020-1004	DEC

#### Table 3-3: AQS Monitoring Sites as of January 2018

\*Coordinates for latitude and longitude are consistent with the World Geodetic System (WGS 84).

### 3.3 Siting Criteria

In 2014 EPA Region 10 provided site evaluation forms to determine compliance with 40 CFR 58 (**Appendix E**) requirements for monitoring path and siting criteria. These forms were distributed to the individual site operators for completion. Summaries of the site evaluation forms are presented in three tables – PM, CO and all other gaseous pollutants – in **Appendix B** of this report. Monitoring site photos and location maps can be found at: <u>http://dec.alaska.gov/air/air-monitoring/monitoring-site-information/</u>.

### 3.3.1 Carbon Monoxide Sites

Carbon monoxide (CO) inlet probes should be at least 1 meter away, both vertically and horizontally, from any supporting structure or wall. For micro-scale sites the probe height must be between 2.5 and 3.5 meters, whereas for other scale sites the probe must be between 3 and 15 meters high.

A probe must have unrestricted airflow for at least 270 degrees, or 180 degrees if it is located on the side of a building. Obstructions must be a minimum distance away equal to twice the distance by which the height of the obstruction exceeds the height of the probe. Trees should not be present between the dominant CO source or roadway and the inlet probe.

The following table (Table 3-4) lists all CO monitoring sites in Anchorage and Fairbanks and how they fit the siting criteria from Appendix E of 40 CFR Part 58.

Site Name	Monitoring Scale	Probe Distance from Wall (meters)	Height (meters)	Unrestricted Air Flow	Spacing from Roadway (meters)	Trees
Garden 02-020-0018	Neighborhood	1	3	180 degrees unobstructed	7	Yes
NCore 02-090-0034	Neighborhood	Not applicable	5	360 degrees unobstructed	85	None

### Table 3-4: CO Monitoring Sites in Anchorage and Fairbanks May 2018

### 3.3.2 Particulate Matter (PM<sub>10</sub> and PM2<sub>.5</sub>) Sites

For micro-scale sites particulate matter inlets must be between 2 and 7 meters from ground level. For other siting scales the probe must be between 2 and 15 meters high.

A sampler must have at least 2 meters separation from walls, parapets, penthouses, etc. A sampler must have unrestricted airflow for at least 270 degrees, or 180 degrees for street canyon sites. Obstructions must be a minimum distance away from the sampler with the separation

equal to twice the distance by which the height of the obstruction exceeds the height of the sampler inlet.

Micro-scale sampler inlets must be located between 5 and 15 meters from the nearest traffic lane for traffic corridor sites, and between 2 and 10 meters for street canyon sites. The minimum separation distance between the probe and nearest traffic lane for middle, neighborhood, or urban scale sites depends upon the number of vehicles per day (VPD) that use the roadway according to a rather complicated table in Appendix E of 40 CFR Part 58. Table 3-5 lists all PM monitoring sites in Alaska and how they fit the siting criteria from Appendix E of 40 CFR Part 58 (also see Appendix B).

Site Name	Monitoring Scale	Height (meters)	Spacing from Obstructions (meters)		Traffic (VPD)	Trees
Garden 02-020-0018	Neighborhood	8	12m to 5m tall penthouse	14	< 5,000	None
Laurel 02-020-0045	Microscale	7	None	15	35, 000	None
Parkgate 02-020-1004	Neighborhood	6	13m to 4m tall penthouse	44	11,000	None
Butte 02-170-0008	Neighborhood	4	> 8	150	Old Glenn Hwy, 5,891*	None
Palmer 02-170-0012	Neighborhood	4	None	>20	Unknown, probably < 5,000	None
State Office Building 02-090-0010	Neighborhood	б	30m to 3.75m tall penthouse	20	7,400	None
NCore 02-090-0034	Neighborhood	4	75 m to 12 m building	70	3,559	None
North Pole Fire #3 02-090-0035	Neighborhood	4	None	23 to Hurst Rd	3,730	> 30
Floyd Dryden 02-110-0004	Neighborhood	7	Furnace flue @ 20m, 4m penthouse @ 15m	65	12,770	12 m tall 25m away

### Table 3-5: PM Monitoring Sites in Alaska as of January 2018

\* McKechnie Loop has only local neighborhood traffic and site is at the dead end of Harrison Court (with three houses).

### 3.4 NCore Site

The NCore site pollutant monitors listed in Table 3-6 are representative at a neighborhood scale. Meteorological monitoring is representative at a microscale. Table 3-6 also lists additional relevant siting information.

Parameter Name	Monitoring Scale	Height (meters)	Spacing from Obstructions (meters)	Spacing from Roadway (meters)	Traffic (VPD)	Trees
NOy, NO & diff	Neighborhood	4	75 m to 12 m building	85	3,559	None
NO <sub>2</sub> , NOx & NO	Neighborhood	4	75 m to 12 m building	85	3,559	None
O <sub>3</sub>	Neighborhood	4	75 m to 12 m building	85	3,559	None
SO <sub>2</sub> (1 hr & 5 min)	Neighborhood	4	75 m to 12 m building	85	3,559	None
T <sub>amb</sub> , WS & WD (2 m)	Microscale	2	75 m to 12 m building	85	3,559	None
T <sub>amb</sub> , WS & WD (10 m)	Microscale	10	75 m to 12 m building	85	3,559	None
Relative Humidity	Neighborhood	2	75 m to 12 m building	85	3,559	None
Barometric Pressure	Neighborhood	4	75 m to 12 m building	85	3,559	None

 Table 3-6: NCore Gaseous\* Monitoring and Meteorological Monitoring as of January 2018 in Alaska

\* Excluding CO and O<sub>3</sub>.

### 3.5 Monitoring Methods, Designation and Sampling Frequency

Tables 3-7 to 3-13 present information for current sites (and monitors) used in coding the data submitted by DEC to the AQS database. The information provided in Tables 3-7 to 3-13 for each monitoring site includes pollutant parameter name, monitor designation, the AQS parameter codes and parameter occurrence codes (POC), the AQS method code, the frequency of sampling, and the instrumentation used. The monitor designation states the purpose for which the data are to be used, such as: for State & Local Air Monitoring Stations (SLAMS) to demonstrate NAAQS compliance, Special Purpose Monitoring sites (SPM) for general air quality assessments, and the Chemical Speciation Network (CSN) for atmospheric chemistry assessments. AQS parameter, method and units codes are specific to the pollutant, instrumentation, and sampling equipment

used, and how the concentration units are expressed in either local conditions or corrected to standard conditions for temperature and pressure. The 5-digit parameter code identifies the parameter being measured e.g.  $PM_{10}$ , SO<sub>2</sub>, or wind speed. The 1-digit POC code is the parameter occurrence code. As suggested by Region 10 EPA, DEC uses the POC to indicate whether the sampler or instrument is (1) a primary data source, or (2) a secondary data source such as a collocated sampler, or (3) that an instrument is measuring on a continuous basis. The AQS method code provides information specific to the analytical technique used for the pollutant determination such as instrumental analysis using chemiluminescence for nitric oxide or gravimetric analysis for particulate. The notation presented in the sample frequency indicates how often the pollutant concentration is determined. For example, 1/6 indicates that one sample is collected every sixth day according to the national EPA air monitoring schedule. Continuous indicates that an instrument is continuously analyzing a sample stream providing a pollutant concentration monitor, a BAM). The equipment information column identifies on-site equipment (either a sampler or instrument) specific to the AQS parameter code.

Other monitoring sites operated by DEC to gather data related to rural road dust and wildland fires, but that are not submitted to the AQS database are discussed in **Appendix C**. The IMPROVE monitoring sites operated in Alaska under the federal program to characterize and protect scenic visibility around National Parks and designated wilderness areas are described in **Appendix D**.

A summary of pollutant concentration data calculated as NAAQS design values, maxima, or as averages are presented in **Appendix E**. Table E-1 and E-2 summarize the annual 98<sup>th</sup> percentile concentrations, and annual and 24 hour design values for the PM<sub>2.5</sub> network. Table E-2 excludes those values caused by exceptional events which EPA has already concurred with and for which DEC has made application for concurrence. Table E-1 shows the values calculated excluding the 2015 summer wildfire exceedances, which EPA has not yet concurred with. In the highly unlikely event that EPA does not concur with DEC's 2015 Exceptional Event Waiver Request this table (E-2) will be correct.

2018 Air Quality Monitoring Plan

Table 3-7: Anchorage MSA: AQS Codes as of April 2018; STD = standard conditions of temperature and pressure; LC = local (actual) conditions of temperature and pressure

Site Name/Location	Pollutant Monitor Parameter Designation		Monitor Starting	AQS Parameter and	AQS Method	Sample	Equipment

## 4 NETWORK MODIFICATIONS COMPLETED IN 2017

### 4.1 Daily PM<sub>2.5</sub> FRM sampling at all FNSB SLAMS sites

DEC increased the sampling frequency at all  $PM_{2.5}$  FRM SLAMS sampling sites in the FNSB non-attainment area. Daily sampling started at the NCore site on October 26, 2016. Effective January 1, 2017 daily FRM sampling commenced at the Fairbanks downtown State Office Building site (SOB) and at the North Pole Fire Station site on July 1, 2017.

### 4.2 PM<sub>2.5</sub> collocation

A Partisol 2000i  $PM_{2.5}$  collocation was moved from the NCore site in Fairbanks to the North Pole Fire Station #3 site to meet colocation requirements for the network in 2017. A Thermo Scientific Sequential Partisol 2025i was received May 7 and anticipated installation at the State Office Building site is June 2018. These two sites will meet collocation requirements for all FRMs in FNSB.

### 4.3 Rural Alaska

DEC has established a Memorandum of Understanding with the City of Bethel. After finalizing site selection for a  $PM_{10}$  and  $PM_{2.5}$  SPM site in Bethel, DEC shipped the monitoring trailer to Bethel and is currently working to get power and DSL connections established. DEC is planning to install a pair of Met One BAM 1020 PM analyzers, which will report to the State's DR DAS data acquisition system and display the AQI on the DEC website. DEC plans to have the site fully operational by July 1, 2018. DEC will report the data to AQS.

# 5 PROPOSED NETWORK MODIFICATIONS FOR 2018

### 5.1 Discontinuation of Ozone Monitoring in the Anchorage MSA

DEC proposed to shutdown ozone monitoring in Palmer and with that eliminate the Anchorage MSA ozone monitoring network in the 2017 Annual Network Plan for calendar year 2018. Due to the delay of the 2017 plan and subsequently the delay of the official EPA approval, DEC continued monitoring during 2018. DEC will dismantle the ozone monitoring site in Palmer after the 2018 monitoring season and therefore cease ozone monitoring in the Anchorage MSA effective January 1, 2019.

2018 Air Quality Monitoring Plan

# **APPENDIX A: NETWORK EVALUATION FORMS**

#### Table A-1: PM<sub>2.5</sub> Network Evaluation form (2 pages)

### PART 58 APPENDIX D NETWORK EVALUATION FORM FOR PM2.5

### STATE: <u>ALASKA</u> AGENCY: <u>DEPARTMENT OF ENVIRONMENTAL CONSERVATION</u> AQS AGENCY CODE: <u>02</u> EVALUATION DATE: <u>APRIL 24, 2018</u> EVALUATOR: <u>ANNA BREUNINGER</u>

APPLICABLE SECTION	REQUIREMENT	CRITERIA MET?			
		YES	NO	N/A	
4.7.1(a)	States, and where applicable local agencies must operate the minimum number of required PM <sub>2.5</sub> SLAMS sites listed in Table D-5 of this appendix. Use the form below and Table D-5 to verify if each of your MSAs have the appropriate number of SLAMS FRM/FEM/ARM samplers.	~			
4.7.1(b)	Each required SLAMS FRM/FEM/ARM monitoring stations or sites must be sited to represent area-wide air quality in the given MSA (typically neighborhood or urban spatial scale, though micro-or middle-scale okay if it represent many such locations throughout the MSA).	*			
4.7.1(b)(1)	At least one SLAMS FRM/FEM/ARM monitoring station is to be sited at neighborhood or larger scale in an area of expected maximum concentration for each MSA where monitoring is required by 4.7.1(a).	*			
4.7.1(b)(2)	For CBSAs with a population of 1,000,000 or more persons, at least one FRM/FEM/ARM $PM_{2.5}$ monitor is to be collocated at a near-road $NO_2$ station.			~	
4.7.1(b)(3)	For MSAs with additional required SLAMS sites, a FRM/FEM/ARM monitoring station is to be sited in an area of poor air quality.	~			
4.7.2	Each State must operate continuous $PM_{2.5}$ analyzers equal to at least one-half (round up) the minimum required sites listed in Table D-5 of this appendix. At least one required continuous analyzer in each MSA must be collocated with one of the required FRM/FEM/ARM monitors, unless at least one of the required FRM/FEM/ARM monitors is itself a continuous FEM or ARM monitor, in which case no collocation requirement applies.	*			
4.7.3	Each State shall install and operate at least one $PM_{25}$ site to monitor for regional background and at least one $PM_{25}$ site to monitor regional transport (note locations in comment field). Non-reference PM2.5 monitors such as IMPROVE can be used to meet this requirement.	*			
4.7.4	Each State shall continue to conduct chemical speciation monitoring and analyses at sites designated to be part of the PM <sub>2.5</sub> Speciation Trends Network (STN).	*

#### PART 58 APPENDIX D NETWORK EVALUATION FORM FOR PM10

### STATE: <u>ALASKA</u> AGENCY: <u>DEPARTMENT OF ENVIRONMENTAL CONSERVATION</u> AQS AGENCY CODE: <u>02</u> EVALUATION DATE: <u>April 18, 2018</u> EVALUATOR: <u>J, STLAURENT</u>

APPLICABLE SECTION	REQUIREMENT	CRIT	ERIA N	MET?
		YES	NO	N/A
4.6(a)	Table D-4 indicates the approximate number of permanent stations required in MSAs to characterize national and regional PM10 air quality trends and geographical patterns. Use the form below and Table D-4 to verify if your PM10 network has to appropriate number of samplers.	*		

Comments: All of the site locations are based on historical agreements among the EPA, ADEC and (where applicable) local agencies.

One exceedance on April 9, 2016 at Palmer, 24% above the NAAQS at  $187\mu$ g/m3, causes the entire Anchorage MSA to be categorized as high concentration. DEC qualified the data as RJ (high winds). This single day could be the basis for an EEWR should EPA request DEC or EPA start another PM<sub>10</sub> designation process. Thus DEC assumes that medium concentration is applicable when this exceptional event is excluded from the compliance calculations (Table E-3).

MSA Description <sup>1</sup>	MSA population <sup>2,3</sup>	Minimum required	Present number of
-		number of PM10	PM10 stations in MSA
		stations (from Table	
		D-4)

### Table B-4: Blank Part 58 Appendix E form for PM

### PART 58 APPENDIX E SITE EVALUATION FORM FOR PM2.5, PM10, PM10-2.5, and Pb

SITE NAME:	SITE ADDRESS:				
AQS ID:	EVALUATION DATE:	EVALUATOR:			
APPLICABLE SECTION	REQUIREMENT	OBSERVED	CRITERIA MET?		
			YES	NO	N/A
2. HORIZONTAL AND VERTICAL PLACEMENT	2-15 meters above ground level for neighborhood or larger spatial scale, 2-7 meters for microscale spatial scale sites and middle spatial scale $PM_{10}$ . 2.5 sties. 1 meter vertically or horizontally away from any supporting structure, walls, <i>etc.</i> , and away from dusty or dirty areas. If located near the side of a building or wall, then locate on the windward side relative to the prevailing wind direction during the season of highest concentration potential.				
3. SPACING FROM MINOR SOURCES	(a) For neighborhood or larger spatial scales avoid placing the monitor near local, minor sources. The source plume should not be allowed to inappropriately impact the air quality data collected at a site. Particulate matter sites should not be located in an unpaved area unless there is vegetative ground cover year round.				
4. SPACING FROM OBSTRUCTIONS	(a) To avoid scavenging, the inlet must have unrestricted airflow and be located away from obstacles. The separation distance must be at least twice the height that the obstacle protrudes above the probe inlet.				
	(b) The inlet must have unrestricted airflow in an arc of at least 180 degrees. This arc must include the predominant wind direction for the season of greatest pollutant concentration potential. For particle sampling, a minimum of 2 meters of separation from walls, parapets, and structures is required for rooftop site placement.				
5. SPACING FROM TREES	(a) To reduce possible interference the inlet must be at least 10 meters or further from the drip line of trees.				
	(c) No trees should be between source and probe inlet for microscale sites.				
6. SPACING FROM ROADWAYS	Spacing from roadways is dependent on the spatial scale and ADT count. See section 6.3(b) and figure E-1 for specific requirements.				
Are there any changes	that might compromise original siting criteria?

### Table B-5: Blank Part 58 Appendix E form for CO

PART 58 APPE	NDIX E SITE EVALUATION FORM FOR CO					
SITE NAME:	SITE ADDRESS:					
AQS ID:	EVALUATION DATE:	EVALUATOR:				
APPLICABLE SECTION	REQUIREMENT	OBSERVED		CRITERIA MET?		
			YES	NO	N/A	
2. HORIZONTAL AND VERTICAL PLACEMENT	For neighborhood or larger spatial scale sites the probe must be located 2- 15 meters above ground level and must be at least 1 meter vertically or horizontally away from any supporting structure, walls, <i>etc.</i> , and away from dusty or dirty areas. If located near the side of a building or wall, then locate on the windward side relative to the prevailing wind direction during the season of highest concentration potential.					
3. SPACING FROM MINOR SOURCES	(a) For neighborhood scale avoid placing the monitor probe inlet near local, minor sources. The source plume should not be allowed to inappropriately impact the air quality data collected at a site.					
4. SPACING FROM OBSTRUCTIONS	(a) To avoid scavenging, the probe inlet must have unrestricted airflow and be located away from obstacles. The separation distance must be at least twice the height that the obstacle protrudes above the probe inlet (exception is street canyon or source-oriented sites where buildings and other structures are unavoidable).					
	(b) The probe inlet must have unrestricted airflow in an arc of at least 180 degrees. This arc must include the predominant wind direction for the season of greatest pollutant concentration potential.					
5. SPACING FROM TREES	(a) To reduce possible interference the probe inlet must be at least 10 meters or further from the drip line of trees.					
	(c) No trees should be between source and probe inlet for microscale sites.					
6. SPACING FROM ROADWAYS	2. (b) Microscale CO monitor probes in downtown areas or urban street canyon locations shall be located a minimum distance of 2 meters and a maximum distance of 10 meters from the edge of the nearest traffic lane.					
	2. (c) Microscale CO monitor inlet probes in downtown areas or urban street canyon locations shall be located at least 10 meters from an intersection and preferably at a midblock location.					
9. PROBE MATERIAL &	(a) Sampling train material must be FEP Teflon or borosilicate glass (e.g., Pyrex) for reactive gases.					
RESIDENCE TIME	(c) Sampling probes for reactive gas monitors at NCore must have a sample residence time less than 20 seconds.					
Are there any changes	that might compromise original siting criteria? If so, provide detail in comme	ent section.				
Other Comments:						

<sup>1</sup> Distance from the edge of the nearest traffic lane. The distance for intermediate traffic counts should be interpolated from the table values based on the actual traffic count.

2018 Air Quality Monitoring Plan

# **APPENDIX C: Additional Monitoring Projects**

### **Smoke Monitoring for Air Quality Advisories**

Smoke from wildland fires can affect large areas and impacts air quality in regions both close to and far away from the burning fire. Almost every summer, large areas of the State are impacted by smoke from wild fires, with air quality degrading into the very unhealthy to hazardous range. DEC assists the Alaska Fire Service in assessing air quality impacts in areas affected by fires and provides information needed to protect public health. The DEC Air Quality Division uses two separate methods to assess air quality impacts and issue air quality advisories statewide: monitoring data and visibility information. Often a combination of both datasets is used to issue air quality advisories. The DEC meteorologist or air quality staff with assistance from the NWS use meteorological and air monitoring data to forecast smoke movement and predict where air quality impacts might be experienced.

DEC, with the help of local site operators, currently operates two continuous analyzers in rural Alaska during the wild fire season: Galena and Ft Yukon. DEC also has two portable, battery-operated, continuous particulate matter monitors (Met One E-BAM) equipped with satellite communication devices, which can transmit the data to a website. The E-BAM instrument requires little maintenance and staff is typically only needed at set-up and to ensure proper operation for the first day. Remote data access allows staff in the DEC office or in the field to use the data for advisories and briefings. Currently no additional samplers are requested, as staff time and travel funds are the limiting factor in expanding the smoke monitoring network.

### **Volcanic Ash Monitoring**

The Alaska Volcano Observatory and DEC will cooperate on volcanic ash monitoring should a volcano begin erupting. DEC uses a  $PM_{10}$  Met One E-BAM with an AIRSIS communication system that allows the DEC meteorologist to review data near real time and issue air quality advisories for the area during volcanic eruptions.

### **Radiation Monitoring**

The State has three radiation monitoring network sites (RadNet) located in Anchorage, Fairbanks and Juneau. Various agencies and groups operate the equipment. The site in Anchorage is operated by the Alaska Department of Health and Social Services. The DEC Air Quality Division operates the sites in Fairbanks and Juneau.

2018 Air Quality Monitoring Plan

# **APPENDIX D: IMPROVE NETWORK**

The Alaska Regional Haze SIP includes a monitoring plan for measuring, estimating and characterizing air quality and visibility impairment at Alaska's four Class I areas. The haze species concentrations are measured as part of the IMPROVE monitoring network deployed throughout the United States. Alaska uses four IMPROVE monitoring stations representing three of the four Class I Areas. Three of these stations (Denali National Park and Preserve, Simeonof, and Tuxedni) were deployed specifically in response to Regional Haze rule requirements. There is no air monitoring being conducted at the Bering Sea Wilderness Area due to its remote location.

Monitoring site information and additional Regional Haze information are available at DEC's Regional Haze website, <u>http://dec.alaska.gov/air/anpms/regional-haze</u>. Monitoring data and additional information for the Alaskan IMPROVE sites are available from the EPA website, <u>http://vista.cira.colostate.edu/improve</u>.
