Specialist

INTRODUCTION

This report was prepared on behalf of Airport Way Professional Building LLC, who has contracted with Alaska Resources & Environmental Services (ARES) to perform groundwater monitoring associated with the known UST release that occurred on the subject property. The ADEC file number for the site is 102.38.143.

SITE BACKGROUND

Site Description

The Airport Way Professional Building parcel (subject property) is situated on an approximate 1-acre site located north of Airport Way at 1406 Kellum Street, Fairbanks, Alaska (Figure 1 and 2). The site is located in the U.S. Geological Survey (USGS) Fairbanks D-2 quadrangle. The legal description for the property is as follows: Tax Lots 2, 3, 4, & 8 Block 137, Weeks Field Subdivision.

History

ARES was authorized in July 2007 to perform a Site Characterization associated with the removal of two UST's located on the subject property. Tank #1 consisted of a 1,000-gallon UST and Tank # 2 consisted of a 300-gallon UST. Both tanks were used for the storage of # 2 diesel fuel for the purpose of heating structures located on the property.

While conducting the Site Assessment during removal and close-out of Tank # 2, petroleum contaminated soils were encountered. Soils had a strong diesel odor, however, soils were not saturated and exhibited characteristics typical of older releases.

During excavation and removal of the 300-gallon UST (Tank # 2) approximately 80 cubic yards (77 tons) of petroleum-contaminated soils were excavated and transported to OIT for treatment by thermal remediation. The remainder of the excavated contaminated soils (approximately 216 yds³) was stockpiled on-site and land farmed in accordance with ADEC approved Work Plan. DRO was detected at a concentration of 1080 mg/kg in the analytical soil samples collected from the soil water interface of the 300-gallon tank excavation. The ADEC cleanup level for DRO in soil is 250 mg/kg. Analytical soil samples collected from the sidewalls and end walls of the 300-gallon UST site were found to be below ADEC target cleanup levels, for all tested analytes.

Per agreement with ADEC, as a condition to close out the site, a groundwater monitoring well (MW-1) was installed hydraulically down gradient from the source area.

Groundwater samples were collected from MW-1 on June 15, 2009, and analyzed for BTEX by EPA method 8260B and DRO by method AK 102. Analytical results indicate that benzene was detected at a concentration of 82.8 ug/L which exceeds ADEC target cleanup levels in groundwater. The ADEC groundwater cleanup level for benzene at the time of analysis was 5 ug/L. The ADEC human health groundwater cleanup level for benzene is currently 4.6 ug/L. Detected concentrations of Toluene, ethylbenzene, xylenes, and DRO (non-detect) were below ADEC groundwater cleanup levels.

Airport Way Professional Building LLC
1406 Kellum Street, Fairbanks, Alaska
January 2018

Based on a groundwater sample results from MW-1, ARES recommended two additional monitoring wells be installed to determine if contaminants were migrating onto the property from an off-site source or if the contaminants were originating from the subject property. The two monitoring wells were installed on June 25, 2009. Monitoring well MW-2 was installed in the source area at the location of the former 300-gallon UST and monitoring well MW-3 was installed hydraulically up gradient on the east property boundary in order to determine the up-gradient conditions.

Analytical results detected concentrations of DRO (6.44 mg/L) in groundwater in source area MW-2 that exceed ADEC groundwater cleanup levels. The cleanup level for DRO in groundwater is 1.5 mg/L. Analytical results confirmed that the groundwater collected from MW-2 was below ADEC cleanup levels for all other tested analytes.

In 2009, during the construction of the Airport Way Professional Building, the groundwater monitoring wells were inadvertently paved over with asphalt. ARES was unsuccessful in locating the wells upon a site visit conducted in July 2016.

In September of 2016, ARES and the Drilling Company reinstalled three permanent groundwater monitoring wells. Analytical soil samples were collected using a Geoprobe truck-mounted direct push drill unit, and analyzed for DRO by method AK 102, BTEX compounds by method EPA 8021B, and PAH by method EPA 8270D. ARES then developed the groundwater monitoring wells and collected analytical groundwater in October 2016. The groundwater samples were analyzed for GRO by method AK101, DRO by method AK 102, and BTEX compounds by method EPA 8021B. ARES also completed a closed loop groundwater elevation survey to determine groundwater flow direction. It was determined that the groundwater flow direction was 45 degrees west of North with a hydraulic gradient of 0.00079 vertical ft/horizontal ft.

Soil analytical results from all boreholes were non-detect for Benzene, Toluene and Ethylbenzene. Soil analytical results from boreholes MW-1 and MW-3 were also non-detect for Xylenes, GRO and DRO. DRO was detected at concentrations below ADEC cleanup levels in soils collected from MW-2. The highest level of DRO detected (9.15 mg/kg) was from borehole MW-2 at 10'-11.5'bgs. Soil analytical results from MW-2 also detected concentrations below ADEC cleanup levels for Xylenes (0.0733 mg/kg) and GRO (1.15 mg/kg). Based on analytical results, the soils collected from each borehole are below ADEC cleanup levels for DRO and BTEX compounds in soil at all monitoring well installation locations.

Groundwater analytical results for all three wells from the October 14, 2016 sampling event were all non-detect or below ADEC cleanup levels for all analytes tested, with the exception of MW-2 (sample ID MW2-1016). DRO was detected in groundwater collected from MW-2 at concentration of 1950µg/L which exceeds the ADEC human health groundwater cleanup level for DRO (1500µg/L).

In August of 2017, ARES performed groundwater sample collection. The groundwater samples were analyzed for GRO by method AK101, DRO by method AK 102, and BTEX compounds by method EPA 8260C. Groundwater analytical results for all three wells from the August 15, 2017 sampling event were all non-detect or below ADEC

cleanup levels for all analytes tested. DRO was detected in groundwater collected from MW-2, at concentration of 400µg/L, which is less than the ADEC human health groundwater cleanup level for DRO (1500µg/L). Analytical results indicate that all collected groundwater samples are below ADEC cleanup levels for DRO, GRO, and BTEX compounds.

Analytical results from the August 15, 2017 sampling event confirm that DRO concentrations in the groundwater collected from source area MW-2 have decreased to below ADEC cleanup levels. Concentrations of DRO detected in groundwater from the down gradient MW-3 have also decreased and remain significantly below ADEC cleanup levels.

A comparison of the analytical results from both sampling events suggests that the contaminated groundwater plume is moving down gradient but natural attenuation is occurring and the concentration of contaminants in the plume is decreasing.

Topography

The United States Geological Survey (USGS) Fairbanks Quadrangle (D-2) provides topographic map coverage of the site (Figure 1). Fairbanks is located in the northern part of the Tanana Basin, which is a relatively flat floodplain of the Tanana River. The subject property is situated approximately 2.5 miles north of the Tanana River and 0.5 miles south of the Chena River. Based upon the topographic map of the Fairbanks Quadrangle, the site elevation is approximately 446 feet above the mean sea level.

Regional Hydrology

The Tanana River is the dominant influence on ground-water flow in the subject area. Two discharge peaks characterize the Tanana River: spring snowmelt runoff and late summer precipitation. The stage of nearby water bodies, including the Chena River, typically rise and fall in response to stage changes of the Tanana River. The depth to groundwater varies in response to these controlling factors. Based on interpretation of USGS data, regional groundwater flow direction is generally to the west-southwest. However, the direction of flow can vary depending upon the stage of the Tanana River.

The Airport Way Professional Building is located approximately 0.42 miles south of the Chena River and 2.64 miles north of the Tanana River.

Scope of Work

To achieve the stated objectives, ARES performed the following tasks:

- Developed groundwater monitoring wells and collected analytical groundwater samples according to the *ADEC Monitoring Well Guidance* September 2013 and 11 AAC 93.140, Alaska Department of Natural Resources, Water Wells. Groundwater samples were analyzed for gasoline range organics (GRO) by method AK101, benzene, toluene, ethylbenzene and total xylenes (BTEX) by method EPA 8260C, and diesel range organics (DRO) by method AK 102.

- Completed a closed loop groundwater elevation survey and calculated groundwater gradient and groundwater flow direction.
- Used groundwater data to determine if contaminants are present in groundwater above ADEC cleanup levels and if contaminants are migrating from the source area; and
- Documented field activities and prepared Final Report.

GROUNDWATER MONITORING WELL SAMPLING

Groundwater Monitoring Well Sampling and Analysis (General Procedure)

Groundwater monitoring wells MW1, MW2, and MW3 and their locations relative to each other and the project site are found in Figure 3. Wells were sampled in order of least likely to be contaminated to most likely to be contaminated.

Sample parameters were collected in the following order:

- Well measurements (water/casing depth, presence of NAPL);
- Water parameters (Temp, pH, conductivity, dissolved oxygen, ORP, and salinity);
- Volatile Organic Compounds (BTEX/GRO); and
- Semi-volatiles organic compounds (DRO).

A bladder pump with new disposable polyethylene tubing, new disposable polyethylene bladders, and new nitrile gloves were used during the 2018 sampling event. Water and casing depth measurements were collected using a Solinst Model 101 Water depth meter SN: 223198. Groundwater depth was measured and recorded before, during, and after sampling. The depth of the well casing was also recorded.

Groundwater was purged and sampled using low-flow techniques. Water quality parameters were obtained using a flow-through-cell and a YSI Multi Parameter Water Meter Model 556 SN: 11H100848. For low-flow sampling, the goal is minimum drawdown (<0.3 feet) during purging. The water level was measured at each timed interval that the water quality parameters are measured and recorded on the field log. Water quality parameters and water level measurements were collected and recorded every three minutes. The measured flow rate was 0.45 L/min during purging and sampling. The maximum draw down of all wells during purging was 0.04'.

The following water quality parameters are considered stable when three successive readings, collected 3 minutes apart, are within:

- $\pm 3\%$ for temperature (minimum of $\pm 0.2^{\circ}\text{C}$);
- ± 0.1 for pH;
- $\pm 3\%$ for conductivity;
- ± 10 mv for redox potential;
- $\pm 10\%$ for dissolved oxygen (DO); and
- $\pm 10\%$ for turbidity.

Once the groundwater parameters stabilized, samples were collected in order of decreasing volatility using a peristaltic pump and new disposable polyethylene tubing. The tubing was carefully lowered in to the well to avoid loss of volatiles and water collected from the tubing was placed directly into lab supplied sample bottles. Volatile samples were collected to avoid any headspace in the bottle. All bottles were labeled and placed in a pre-chilled cooler (at approximately 4°C) and submitted to ADEC approved laboratory following chain of custody (COC) procedures.

Monitoring wells were capped and locked after use.

Groundwater samples were analyzed as follows:

- BTEX compounds by EPA Method 8260C;
- Gasoline Range Organics (GRO) by Method AK 101; and
- Diesel Range Organics (DRO) by Method AK 102.

Purge water collected during the sampling event was placed into individually labeled 5-gallon buckets with lids. The buckets were labeled “1406 Kellum Street MW Sampling/Well #” and were temporarily stored off-site until status of water quality could be determined. Upon receipt of sample results indicating that the water was below ADEC cleanup levels, the water was released to the ground surface.

Field Observations

During the 2018 groundwater sampling event, no odor or color was observed in the groundwater purged from the monitoring wells.

Analytical Results

All three monitoring wells were sampled and analyzed for BTEX by EPA method 8260C, GRO by method AK101, and DRO by method AK102 by TestAmerica Laboratories, Inc., Seattle, WA. A historical summary of groundwater analytical results are included in Table 1. Complete laboratory results are included in Appendix B.

ND – Not detected above reporting limit

QUALITY ASSURANCE AND QUALITY CONTROL

Blind Duplicate Samples

Field quality control (QC) procedures for this project included the collection and analysis of one blind field duplicate sample. One blind field duplicate water sample was collected. The blind field duplicate sample was analyzed for the same compounds as the original sample. The QC sample was analyzed to assess the quality of sample collection and handling, as well as the accuracy and precision of the laboratory's analytical procedures.

RPD calculations provide a comparison of two theoretically identical samples that are submitted blind to the laboratory in order to provide an un-biased measure of precision. Due to the nature of the RPD calculation, sample data for both samples must be reported in order for the RPD calculation to provide meaningful data. The RPDs are shown in Table 2 below for all analytes with calculable RPDs.

Table 2: Relative Percent Difference Calculations in Water

Sample ID / Duplicate ID	Compound	Sample Concentration (µg/L)	Duplicate Concentration (µg/L)	RPD (Limit < 30%)
MW2-718 / D-718	DRO	300	350	15.4%

Given two sample concentrations (X and Y) the formula to determine RPD is the absolute value of the following:

$$[(X - Y) / ((X + Y) / 2)] * 100 = \text{RPD}$$

Results above ADEC recommended range in **Bold**.

The ADEC recommended RPD limit for water analysis is < 30%. The blind field duplicate RPD calculation fell within the ADEC recommended range for all of the calculated RPD values. No impact to data quality or usability is expected for all analytes based upon the blind field duplicate RPD calculation.

Trip Blank Samples

Field quality control (QC) procedures for this project included the analysis of one water trip blank sample which accompanied the samples in the field. The trip blank sample was analyzed to assess the quality of sample collection and handling.

In ideal conditions the analysis of a trip blank sample should not indicate the presence of any of the tested analytes in a quantity above the method reporting limit (MRL). A result above the MRL can indicate that cross-contamination occurred between samples during sample transport or analysis, or indicate laboratory contamination.

The trip blank sample for this project was analyzed for GRO by method AK 101 and BTEX by method 8260C. No compounds were detected above the MRL in the water trip blank sample. There is no indication that cross-contamination between samples occurred.

Data Quality Data Review

The ADEC Environmental Laboratory Data Quality Assurance Requirements (ADEC 2009) and United States Environmental Protection Agency (EPA) National Functional Guidelines for Organic Superfund Data Review (EPA 2018) were followed in this site investigation. The data was reviewed to determine the data quality and to evaluate potential impact on the usability of the data. The review was performed using Level II reports that were provided by TestAmerica Laboratories, Inc. in Seattle, WA. The analytical laboratory reports, chain-of-custody records, and ADEC Lab Quality Checklists are included in Appendix B.

The following quality control parameters were reviewed:

- Holding times
- Sample handling and receiving
- Surrogate percent recovery
- Field duplicate sample comparability
- Matrix spike/matrix spike duplicate (MS/MSD) percent recoveries and relative percent difference (RPD)
- Laboratory control sample (LCS)/Laboratory control sample duplicate (LCSD) percent recoveries and RPD
- Method blanks
- Trip blanks
- Method Sensitivity – reporting limits and limit of quantitation (LOQ)

The quality control parameters for the TestAmerica Laboratory Report 580-78913-1 were found to be within accepted limits.

CONCLUSIONS AND RECOMMENDATIONS

Groundwater analytical results for all three wells from the July 13, 2018 sampling event were non-detect or below ADEC cleanup levels for all analytes tested. DRO was detected in groundwater collected from MW-2 at a concentration of 300µg/L (blind field duplicate, D-718, had a DRO concentration of 350µg/L). Analytical results indicate that all collected groundwater samples are below ADEC cleanup levels for GRO and BTEX compounds.

A comparison of the analytical results from historical sampling events indicates a three-year trend of decreasing concentrations of all tested analytes.

ARES recommends the following:

- ARES recommends that annual groundwater monitoring be concluded. No additional sampling events should be required. Following ADEC approval, groundwater monitoring wells at the site should be decommissioned according to ADEC specification;
- ARES also recommends that ADEC grant Cleanup Complete-Institutional Controls status to the site;
- Due to presence of known soil contamination at the site, ARES recommends institutional controls for the site to include a requirement for field screen sampling for POLs and segregation of POL contaminated soils should excavation occur in the vicinity of the source area at the site in the future (road reconstruction, installation of cable utilities etc.).

Limitations

This report presents the analytical results from a limited number of soil and groundwater samples and should not be construed as a comprehensive study of groundwater quality at the site. The samples were intended to evaluate the presence or absence of contaminants at the locations selected. Detectable levels of petroleum hydrocarbons may be present at other locations. It was also not the intent of our sampling and testing to detect the presence of groundwater affected by contaminants other than those for which laboratory analysis were performed. No conclusions can be drawn on the presence or absence of other contaminants. This is not a geotechnical study.

The data presented in this report should be considered representative of the time of our site observations and sample collection. Changes in site conditions can occur with time because of natural forces or human activity. ARES reserves the right to modify or alter conclusions and recommendations should additional data become available.

This report was prepared for the exclusive use of Airport Way Professional Building, LLC and their representatives. If it is made available to others, it should be for information on factual data only and not as a warranty of subsurface conditions.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is \leq background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	False	Headspace larger than 1/4" in one vial, one vial with acct. headspace
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Laboratory Data Review Checklist

Completed By:

Caleb Aronson

Title:

Environmental Specialist

Date:

December 11, 2018

CS Report Name:

Airport Way Professional Building 2018 Groundwater Monitoring Report

Consultant Firm:

Alaska Resources and Environmental Services

Laboratory Name:

TestAmerica Laboratories, Inc., Seattle, WA

Laboratory Report Number:

580-78913-1

ADEC File Number:

102.38.143

Hazard Identification Number:

4360

1. Laboratory

a. Did an ADEC CS approved laboratory receive and perform all of the submitted sample analyses?

Yes No

Comments:

b. If the samples were transferred to another “network” laboratory or sub-contracted to an alternate laboratory, was the laboratory performing the analyses ADEC CS approved?

Yes No

Comments:

2. Chain of Custody (CoC)

a. CoC information completed, signed, and dated (including released/received by)?

Yes No

Comments:

b. Correct Analyses requested?

Yes No

Comments:

3. Laboratory Sample Receipt Documentation

a. Sample/cooler temperature documented and within range at receipt (0° to 6° C)?

Yes No

Comments:

The temperature of the cooler at receipt was 5.8°C.

b. Sample preservation acceptable – acidified waters, Methanol preserved VOC soil (GRO, BTEX, Volatile Chlorinated Solvents, etc.)?

Yes No

Comments:

c. Sample condition documented – broken, leaking (Methanol), zero headspace (VOC vials)?

Yes No

Comments:

d. If there were any discrepancies, were they documented? For example, incorrect sample containers/preservation, sample temperature outside of acceptable range, insufficient or missing samples, etc.?

Yes No

Comments:

One vial had headspace greater than 1/4".

e. Data quality or usability affected?

Yes No

Comments:

4. Case Narrative

a. Present and understandable?

Yes No

Comments:

b. Discrepancies, errors, or QC failures identified by the lab?

Yes No

Comments:

c. Were all corrective actions documented?

Yes No

Comments:

Not applicable

d. What is the effect on data quality/usability according to the case narrative?

Yes No

Comments:

No affect

5. Samples Results

a. Correct analyses performed/reported as requested on COC?

Yes No

Comments:

b. All applicable holding times met?

Yes No

Comments:

c. All soils reported on a dry weight basis?

Yes No

Comments:

Not applicable

d. Are the reported LOQs less than the Cleanup Level or the minimum required detection level for the project?

Yes No

Comments:

e. Data quality or usability affected?

Yes No

Comments:

6. QC Samples

a. Method Blank

i. One method blank reported per matrix, analysis and 20 samples?

Yes No

Comments:

ii. All method blank results less than limit of quantitation (LOQ)?

Yes No

Comments:

iii. If above LOQ, what samples are affected

Comments:

iv. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?

Yes No

Comments:

v. Data quality or usability affected?

Comments:

Not affected

b. Laboratory Control Sample/Duplicate (LCS/LCSD)

i. Organics – One LCS/LCSD reported per matrix, analysis and 20 samples?
(LCS/LCSD required per AK methods, LCS required per SW846)

Yes No

Comments:

ii. Metals/Inorganics – one LCS and one sample duplicate reported per matrix,
analysis and 20 samples?

Yes No

Comments:

iii. Accuracy – All percent recoveries (%R) reported and within method or
laboratory limits? And project specified DQOs, if applicable. (AK Petroleum
methods: AK101 60%-120%, AK102 75%-125%, AK103 60%-120%; all
other analyses see the laboratory QC pages)

Yes No

Comments:

iv. Precision – All relative percent differences (RPD) reported and less than
method or laboratory limits? And project specified DQOs, if applicable. RPD
reported from LCS/LCSD, MS/MSD, and or sample/sample duplicate. (AK
Petroleum methods 20%; all other analyses see the laboratory QC pages)

Yes No

Comments:

v. If %R or RPD is outside of acceptable limits, what samples are affected?

Comments:

vi. Do the affected sample(s) have data flags? If so, are the data flags clearly
defined?

Yes No

Comments:

vii. Data quality or usability affected? (Use comment box to explain.)

Comments:

No affect

c. Surrogates – Organics Only

i. Are surrogate recoveries reported for organic analyses – field, QC and laboratory samples?

Yes No

Comments:

ii. Accuracy – All percent recoveries (%R) reported and within method or laboratory limits? And project specified DQOs, if applicable. (AK Petroleum methods 50-150 %R; all other analyses see the laboratory report pages)

Yes No

Comments:

iii. Do the sample results with failed surrogate recoveries have data flags? If so, are the data flags clearly defined?

Yes No

Comments:

Not applicable

iv. Data quality or usability affected?

Comments:

No affect

d. Trip blank – Volatile analyses only (GRO, BTEX, Volatile Chlorinated Solvents, etc.):
Water and Soil

i. One trip blank reported per matrix, analysis and for each cooler containing volatile samples? (If not, enter explanation below.)

Yes No

Comments:

ii. Is the cooler used to transport the trip blank and VOA samples clearly indicated on the COC? (If not, a comment explaining why must be entered below)

Yes No

Comments:

iii. All results less than LOQ?

Yes No

Comments:

iv. If above LOQ, what samples are affected?

Yes No

Comments:

v. Data quality or usability affected?

Comments:

No affect

e. Field Duplicate

i. One field duplicate submitted per matrix, analysis and 10 project samples?

Yes No

Comments:

ii. Submitted blind to lab?

Yes No

Comments:

iii. Precision – All relative percent differences (RPD) less than specified DQOs?
(Recommended: 30% water, 50% soil)

$$\text{RPD (\%)} = \text{Absolute value of: } \frac{(R_1 - R_2)}{((R_1 + R_2)/2)} \times 100$$

Where R_1 = Sample Concentration
 R_2 = Field Duplicate Concentration

Yes No

Comments:

RPD = 15.4%

iv. Data quality or usability affected? (Use the comment box to explain why or why not.)

Comments:

No affect

f. Decontamination or Equipment Blank (If not applicable, a comment stating why must be entered below).

Yes No Not Applicable

Comments:

i. All results less than LOQ?

Yes No

Comments:

ii. If above LOQ, what samples are affected?

Comments:

iii. Data quality or usability affected?

Comments:

7. Other Data Flags/Qualifiers (ACOE, AFCEE, Lab Specific, etc.)

a. Defined and appropriate?

Yes No

Comments:
