

IMPORTANT INFORMATION ABOUT LEAD IN YOUR DRINKING WATER

All Community and Non-Transient Non-Community public water systems are now required to develop a Lead Service Line Inventory (LSLI). The goal of this effort is to identify and remove sources of lead in our drinking water.

Lead enters drinking water primarily through the wearing away of materials containing lead, such as fixtures, interior plumbing, and the pipe that connects your home to the water main (service line). The inventory is intended to aid in the identification and removal of lead service lines. Though it is unlikely that you have a lead service line, it is important to check since lead exposure can cause serious health effects if too much enters your body. Your utility may ask for your help identifying the material of your service line as well as interior plumbing. They will provide you with instructions on what to look for and how to submit your findings.

HOW TO IDENTIFY SERVICE LINE MATERIAL

LEAD

A dull, silver colored pipe that can be easily scratched with a coin or Key. Scratching leaves a shiny silver color. Magnets WILL NOT stick to lead pipes. Lead pipes are bendable and commonly have a "bulb"

HOW TO IDENTIFY SERVICE LINE MATERIAL

LEAD

A dull, silver colored pipe that can be easily scratched with a coin or Key. Scratching leaves a shiny silver color. Magnets WILL NOT stick to lead pipes. Lead pipes are bendable and commonly have a "bulb"

Brown colored pipe that can be easily scratched with a coin or Key. Scratching leaves a copper color. Magnets WILL NOT stick to copper pipes.

COPPER

Brown colored pipe that can be easily scratched with a coin or Key. Scratching leaves a copper color. Magnets WILL NOT stick to copper pipes.

COPPER

GALVANIZED IRON

A dull, silver colored pipe that is hard to scratch with a coin or Key. Scratching leaves a dull gray color. A magnet WILL stick to a galvanized iron pipe.

GALVANIZED IRON

A dull, silver colored pipe that is hard to scratch with a coin or Key. Scratching leaves a dull gray color. A magnet WILL stick to a galvanized iron pipe.

Generally white, black or blue piping. Plastic piping is rigid. A magnet WILL NOT stick to plastic pipe.

PLASTIC

Generally white, black or blue piping. Plastic piping is rigid. A magnet WILL NOT stick to plastic pipe.

PLASTIC
