

POTENTIAL PLACES OF REFUGE: PART ONE – INTRODUCTION

Purpose and Scope

This Potential Places of Refuge (PPOR) section supplements information found elsewhere in the North Slope Subarea Contingency Plan for Oil and Hazardous Substances Spills and Releases, commonly referred to as the North Slope Subarea Contingency Plan (SCP). Information about sensitive areas associated with PPOR may be found in the Sensitive Areas - Section D of the SCP. Information about response strategies to protect sensitive areas and areas of public concern associated with PPOR are referenced in – Section G of the SCP.

A “place of refuge” is defined as a location where a vessel needing assistance can be temporarily moved to, and where actions can then be taken to stabilize the vessel, protect human life, reduce a hazard to navigation, and/or protect sensitive natural resources and other uses of the area (e.g., subsistence harvesting, commercial fishing, recreational boating). A place of refuge may include constructed harbors, ports, natural embayments, or offshore waters. This section identifies potential docking, anchoring, and mooring locations that may be selected as Places of Refuge in the North Slope Subarea. Actual designation of a Place of Refuge will always be an incident-specific decision made by the U.S. Coast Guard Captain of the Port (COTP) for Western Alaska.

The North Slope Subarea has thousands of miles of environmentally sensitive coastline. In addition to sensitive shoreline habitats such as marshes, sheltered tidal flats, and exposed tidal flats, North Slope supports a number of sensitive biological resources including birds, fish and shellfish, and marine mammals. The local communities are heavily reliant on marine resources for their livelihood and subsistence. Because of this unique relationship with the marine environment much of the coast is utilized for subsistence activities and is extremely sensitive to the impacts of marine commerce, especially oil spills. Additional information about identification of sensitive areas and resources may be found in Section D of the SCP.

The North Slope Subarea lands are managed under a variety of land use management plans including;

- North Slope Coastal Management Plan,
- National Petroleum Reserve Alaska Management Plan
- Alaska National Wildlife Refuge Comprehensive Conservation Plan
- Alaska Maritime National Wildlife Refuge Comprehensive Conservation Plan

The North Slope Subarea is used for limited marine commerce. This commerce has been directed at resupplying the communities and industry during the ice-free period of the summer and fall months. With climate change precipitating the ongoing reduction in sea ice and the subsequent expansion of the operating season, it is likely that shipping and industrial activities will increase throughout the Arctic. This activity will see a corresponding rise in marine commerce utilizing a variety of different types of vessels. Fuel barges, freighters, container ships, drilling ships, tankers and cruise ships operating in, and transiting through the North Slope may become more routine.

The North Slope is an unique operating environment, with limited infrastructure, extreme weather and few protected anchorages. These consideration affect the ability to accommodate stricken vessels of any size in these waters. The protection offered in most of the sites listed is limited and available only under certain circumstances outlined in the plans. In developing this section consideration was given to historical anchorage sites near communities. These are well known areas that have access to some of the limited infrastructure that may affect repairs and assist in the response.

It is understood that there is no perfect docking, mooring or anchoring site for all vessels in all situations. A vessel's length and draft are major determining factors when considering a site for refuge. Deep draft vessels, such as oil tankers and cruiseships, cannot be taken to certain locations. Some ports and bays may have shallow approaches and deep draft ships cannot enter these locations. Shallower draft vessels, such as fishing vessels and supply vessels may be able to utilize these ports. For the purposes of this section, vessels have been divided into four categories:

Deep Draft II Vessels are vessels with lengths up to and greater than 1000 feet and typically they have drafts of 40-60 feet. The predominant deep draft vessels that may operate in the North Slope are container ships and tankers that are designed to the New Panamax dimensions..

Deep Draft I Vessels are vessels with lengths up to and greater than 1000 feet and typically they have drafts of 20-40 feet. The predominant deep draft vessels of this type that may operate in the North Slope are cruiseships, container ships and tankers.

Light Draft Vessels are vessels up to 450 feet in length and have drafts to 20 feet. Freighters, catcher processors, and ocean going tugs are the most common light draft vessels operating in North Slope Alaska.

Shallow Draft Vessels are less than 300 gross tons and have drafts less than 15 ft.

The information in this section may be used for a vessel of any size that has suffered an incident which creates a need for a temporary place of safe refuge, but it is focused on deep draft and light draft size vessels. Shallow draft sites were identified as assets for responding to PPOR incidents.

How the Document Was Developed

This section was developed in 2011 by a Work Group of interested and knowledgeable stakeholders in keeping with the Alaska Regional Response Team's "Guidelines for Places of Refuge Decision-Making," (Alaska Federal/State Preparedness Plan for Response to Oil and Hazardous Substance Discharges/Releases, Annex O). The Work Group arrived at a consensus on the potential places of refuge and submitted this document to the Subarea Committee for approval and inclusion in the North Slope Subarea Contingency Plan. The Work Group participants represented the following organizations:

- Alaska Department of Environmental Conservation
- Alaska Department of Natural Resources
- Alaska Department of Fish and Game
- Alaska Marine Pilots Association
- U.S. Coast Guard
- U.S. Department of the Interior – Offices of Environmental Policy and Compliance, Fish and Wildlife Service, and National Park Service
- U.S. Environmental Protection Agency
- North Slope Borough
- City of Barrow
- City of Point Lay
- North Slope Planning Planning Commission

The first step of the PPOR process was to identify candidate sites (anchorage, moorings, docks/piers,) within the North Slope Subarea. The Workgroup began by researching available information to determine major risk factors in the North Slope Subarea. Maps were developed, depicting the following risk and logistical information:

May 2011

Locations of bulk fuel facilities and pipelines (Figure H-1);
Location of noncrude carrier routes (Figure H-2);
Locations of communities with spill response agreements, spill response hubs and equipment depots (Figure H-3);
Locations of geographic response strategies (Figure H-4);
Locations of major airports (Figure H-5);
Locations of marine casualty events (Figure H-6).

Figure H-7 is a composite map of all risk factors combined.

The second step led to the identification of 16 PPOR sites within the North Slope Subarea. A site assessment matrix (Table H-2) and key (Table H-1) were developed. The matrix consists of identified sites in each row with information about risk factors and site selection criteria in the columns. The information presented for each site includes:

PPOR identification;
Response Zone #;
Type of Berth;
Location Name;
Latitude;
Longitude;
Maximum Vessel Depth
Anchoring Swing Room or Dock Face in feet;
Depth at dock face;
Depth at anchorage;
Bottom Type;
Exposure to;
Conflicting uses;
Ability to boom;
GRS in the area;
Sensitive Resources;
Distance to population centers; and
Distance to alternate PPOR.

The PPOR identification method begins with a “DII”, “DI” “L” or “S” which indicates the appropriate size vessel for the site. Following the letter is a number which indicates the response zone in which the site is located. This is then followed by a number which is a unique site identifier with no importance attached to the magnitude of the number.

The site assessment matrix contains potentially suitable emergency anchorage, docking and moorage locations based on operational factors such as water depth, swing room, exposure/protection, and navigational approach. Sites are grouped by the individual response zones and then by the maximum vessel size category suitable for the site.

Step 3 was to identify specific factors that should be considered as part of the site assessment process. These factors include:

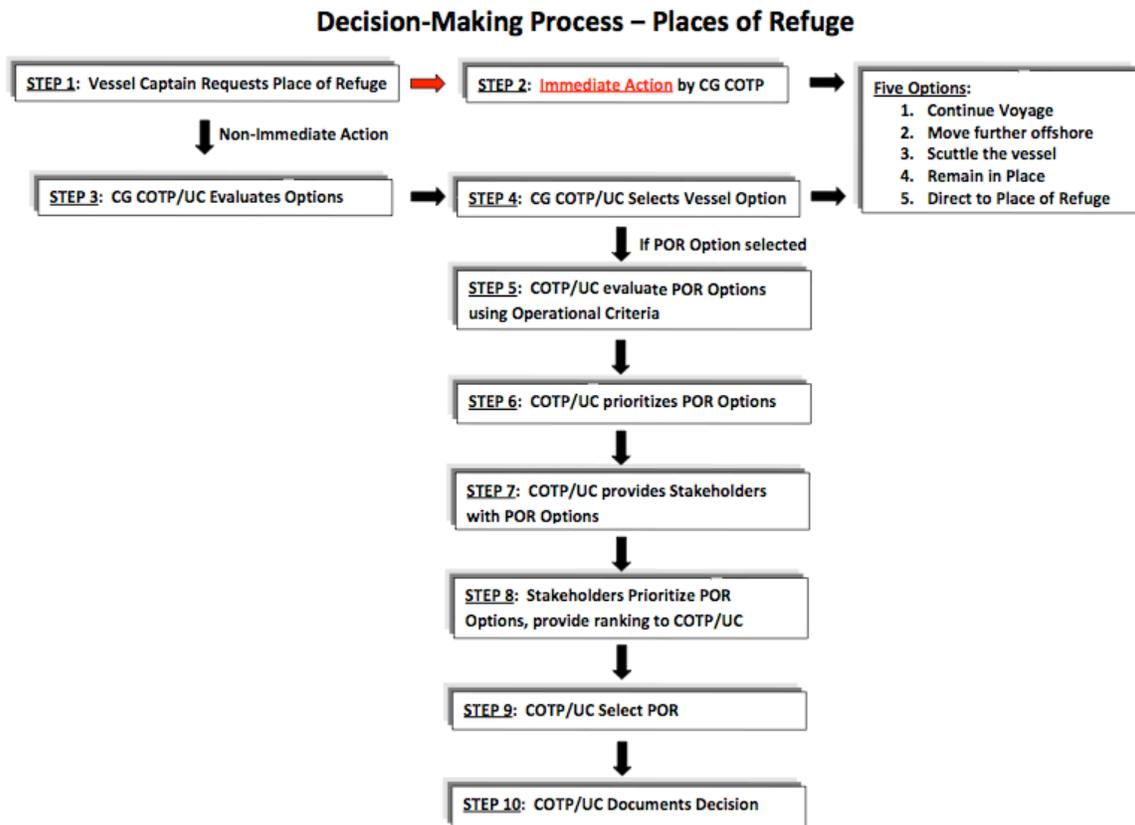

- Distance from population and logistics centers;
- Proximity to environmentally sensitive areas, wildlife resources, threatened or endangered species or habitats, and/or historic properties;
- Uses, such as fisheries, subsistence use, tourism and recreational use, and the location of public or private facilities;
- Response factors such as booming feasibility and the proximity to existing Geographic Response Strategy (GRS) sites; and

- The distance from the closest alternative PPOR.

Step 4 was allow for the workgroup and stakeholder in the area to review the developed documents. In this review the workgroup was able to edit and comment on the documents included in this section to ensure that information critical to their area is included.

How to Use the Potential Places of Refuge Section

The "Guidelines for Places of Refuge Decision-Making" (Annex O of the Unified Plan) will be used for places of refuge decision-making in the North Slope Subarea. As outlined in the guidelines, when the U.S. Coast Guard Captain of the Port (COTP) receives a request from a vessel master or his/her representative to move a vessel to a place of refuge--or in the event there are no individuals on board the vessel authorized to make the request, or the vessel has been abandoned and the COTP needs to consider moving the vessel to a place of refuge--the COTP will initiate the decision-making process in Appendix 1 of Annex O. As outlined in Steps 2 and 3 in Appendix 1, if the COTP/ Unified Command determines that places of refuge should be considered for an incident-specific response, the information in the North Slope PPOR document may be used to provide background information to help expedite the incident-specific place of refuge decision. The steps of the decision-making process are displayed as follows:

The information provided in this document should help decision-making by providing site-specific information to the COTP/Unified Command.

May 2011

Part Two of this document contains site-specific information for some of the PPOR in the North Slope Subarea. An index map (Figure hold for final document) at the beginning of this section shows the location of the PPOR maps. Each PPOR map consists of two parts: 1) a map page showing a locator map, and detailed nautical charts; and 2) a table page providing site information and local site conditions. All geographic data was collected using Mercator Projection, North American Datum 1983.

Who to Contact for Input

Comments and recommendations on these PPOR are welcomed. Please send your comments to either of the following agencies:

Alaska Department of Environmental Conservation
Prevention and Emergency Response Program
555 Cordova Street
Anchorage, AK 99501

United States Coast Guard
Captain of the Port, for Western Alaska
510 L Street- Suite 100
Anchorage, AK 99501-1946

POTENTIAL PLACES OF REFUGE: PART TWO – PPOR MAPS

Index of PPOR Maps

The Workgroup developed 4 PPOR Maps within the North Slope Subarea to correspond with the response zones established by oil spill responders in the area. These maps aid in the site assessment process. These maps are larger in scale, showing a small portion of the Subarea in more detail than the maps in Part One. Figure H-11 provides an overview of the Subarea, identifying the location of each PPOR Map. Each PPOR Map has been assigned an identifying number, which has no relevance other than as a map identifier.

Figure H-11. North Slope Alaska Zone Map for Potential Places of Refuge.

PPOR Maps

Each PPOR Map consists of two parts: 1) a graphic showing a locator map, pictures, and detailed nautical charts showing the location of anchorages, docks, and moorings and other information critical to the selection of a place of refuge; and 2) a series of tables providing site information regarding local site conditions, environmental sensitivities and other considerations.
