Yukon-Charley Rivers National Preserve

Prospectors and miners poked and prodded around most of the creeks within Yukon-Charley Rivers National Preserve. Among the drainages between Eagle and Circle, several have proven to be gold bearing. These include the Seventymile River, Charley River, Ben, Sam, Coal, Woodchopper and Fourth of July creeks.[3] Of these, Coal Creek and Woodchopper Creek account for approximately six tons of gold. Production on Fourth of July Creek and others was much less. Unfortunately, at this point complete production figures are not available for these creeks.

Fourth of July Creek heads approximately 12 miles south of the Yukon River and flows in a northeasterly direction for most of its length. It enters the Yukon approximately 50 miles downstream from Eagle, and 100 upstream from Circle. It's major tributary, Crowley Creek, enters at roughly the halfway point. Four miles from the Yukon, Fourth of July Creek leaves its valley and crosses a flat area until it empties into the Yukon behind an island several miles downstream from the Nation River. [4]
