Sounds good to me. I hope someone can compare the results with either other water bodies or a standard; otherwise they may be of little value in the determination process. Of course data validity hasn't had much to do with a water body listing in the past, as I see it.

Yesterday I began a sampling program for Hammers Slough. My plan is to sample for Settleable Solids (SS) and Total Suspended Solids (TSS). I will do daily sampling for the month of February. This will be for the comment period. I will submit these results along with photographs and text.

February 7, 1996    SS=0.03 ml/L            TSS=9.6667 mg/L
