MEMORANDUM FOR CENPA-EN-MB-A

SUBJECT: Sampling Report, Underground Storage Tank Remediation,
Fort Richardson, AK

1. References:

- a. Verbal Request, CENPA-EN-MB-C, Williams/Thomas, dated 21 May 1990, subject: Cost Estimate/Capability for subject project.
- b. State of Work (Scope and Deliverables), undated, subject as above, hand carried at time of reference 1a.
- c. Work Plan, dated 18 July 1990, Part I: Sampling, Analysis for Underground Storage Tank Remediation, Fort Richardson, Alaska.
- d. State of Alaska Department of Environmental Conservation and the Board of Storage Tank Assistance, Underground Storage Tank Emergency Regulations, 18 AAC 78 Table D (enclosed).
- e. Federal Drinking Water Standards, 40 CFR 141.
- f. Alaska Drinking Water Standards, 18 AAC 80.050.
- g. Resource Conservation and Recovery Act (RCRA) Treatment Standards for Landfill Disposal.

2. GENERAL

- a. The objective of the project was to obtain data for closure of the UST sites in accordance with the requirements of Alaska Department of Environmental Conservation (ADEC). To close the sites, the ADEC has required soil borings to check for POL contamination and to determine if further excavation is required for clean up where underground storage tanks (UST) were removed.
- b. Data in this report was developed in response to the work plan dated 18 July 1990, Underground Storage Tank Remediation, Phase II, Fort Richardson, Alaska. The sampling (Work Plan) was developed by the US Army Corps of Engineers, Alaska District, to meet the objectives cited above.
- c. The exploration logs, enclosure 2, in this report were developed from data collected during field exporation. Soil classification was performed by CENPD-PE-GT-L on material collected using split spoons.
- d. Boring Location maps are included as enclosure 3.

CENPA-EN-G-M (200-1c)

SUBJECT: Sampling Report, Underground Storage Tank Remediation,
Fort Richardson, AK

3. GENERAL SITE BACKGROUND INFORMATION

a. Location: Fort Richardson is located within the municipality of Anchorage, Alaska (Figure 1). The base occupies lowlands to the west of the Chugach Mountains. The lowlands consist of surface deposits of glacial till, outwash, and silt. The Elmendorf Moraine transects the installation in a northeast-southwest direction and consists of glacial deposits of unconsolidated till composed of poorly sorted boulders, gravel, sand and silt. The rocks and boulders often made drilling and drive sampling time consuming. When drill or drive refusal is encountered prior to obtaining the desired depth, the bore hole was off set a few feet and attempted again. The Bootlegger Cove clay underlies the alluvial deposits. (reference 1.4j of sampling plan.)

b. Surface Drainage: The primary surface drainage features are Eagle River and Ship Creek, which originate in the Chugach Mountains and flow westerly across the installation into Knik Arm of Cook Inlet. Eagle River is fed by turbid glacial melt waters with maximum runoff occurring in August. Eagle River is hydrologically upgradient from the main base facilities. Ship Creek and its tributaries are fed by snowmelt and rainwater run off, with maximum run off occurring in June. Ship Creek runs through the base near the southern boundary, and is hydrologically downgradient from the primary base facilities.

c. Groundwater under the areas occur primarily as a result of percolation from surface water. It occurs in aquifers to depths of 400 feet. Groundwater was found at buildings, 367012 and 35752. Although water was encountered at buildings 770, 702, 908 and 55804; none of the wells installed at the latter locations produced enough water for sampling purposes.

4. Overview of Chemical Analysis and Standards:

a. Soil: Table D of ADEC guidelines for soil cleanup at underground storage tanks is enclosed. These guidelines require the use of a matrix involving several parameters such as soil type, receptors, proximity to groundwater, total quantity of contaminated soil and contaminant concentration. Exploration logs indicate soil types as required for development of the ADEC matrix to determine cleanup levels for USTs.

b. Although there are no regulatory cleanup levels for metals in soils, the presence of high lead levels could indicate the presence of leaded motor fuel. In addition, there are restrictions on soils that are to be placed in landfills. TCLP MCLs are included in Table I for comparison with landfill restrictions. Because of test methodology and reporting parameters, TCLP metal results cannot exceed limits unless total metals exceed 10 times TCLP limits. Enclosure 1 demonstrates the mathematical logic.

CENPA-EN-G-M (200-1c)

SUBJECT: Sampling Report, Underground Storage Tank Remediation,
Fort Richardson, AK

c. Water: State of Alaska regulations have designated groundwater as potential drinking water. Table I shows soil and drinking water maximum contaminant levels (MLS) from reference 1d, e, f, and g. Analytic results of groundwater samples can be compared with drinking water MCLs from that table.

d. Water samples for BH-16 (AP-2986) were found to contain kerosene at less than quantifiable levels. Lead at 0.0077 mg/l exceeds drinking water standards of 0.005 mg/l.

5. SITE SPECIFIC INFORMATION

a. BUILDING 36012 (See Table "Building 36012" for Chemical Test Results)

Soil contaminant levels were below laboratory detection levels for fuels, kerosene, gasoline, diesel fuel #2, jet fuel (as jet A), and bunker oil. Volatile organics range from below laboratory detection limit to a numeric high level of 240 ug ethylbenzene per Kg of soil (ug/Kg) near the surface of BH-5 (AP-2974). Site observations indicated highest contamination levels were near the top of existing groundwater, 12-18 feet below ground surfaces.

b. BUILDING 770 (See Table "Building 770" for Chemical Test Results)

Three borings were made and one monitoring well installed. Soil sample concentrations were all below limits from reference 1d. A single monitoring well was installed in BH-6 (AP-2976).

c. BUILDING 702 (See Table "Building 702" for Chemical Test Results)

(1) Minor relocations of these holes were required because of numerous cobbles and boulders. Borehole 11a was abandoned at about 25 feet, and relocated as BH-11b. Boring Log AP-2981 is a composite of BH-11a and BH-11-b. Location of AP-2981 is shown on the map.

(2) Although minor water showed in BH-10 (AP-2980) and a well was installed, there was no water in the well on the following day. Sample analysis showed diesel fuel near the surface at AP-2980 and a small pocket of benzene, toluene, ethylbenzene and xylenes (BTEX). BTEX was found at 25 feet. However, the concentrations measured did not exceed maximum levels as outlined in reference 1d.

(3) There wasn't adequate groundwater for sample collection. Building 702 is an active fuel handling facility, consequently, the presence of surface fuel was caused by on-going site activities.

Rationale for total metals versus Toxic Characteristic Leaching Procedure (TCLP).

TCLP maximum contaminant levels (MCLs) are based on the fact that leachable metals are a greater environmental hazard than insoluable ones.

The test procedure requires leaching of 100 grams of soil into 1 liter of solution. The results for comparison with MCLs are reported in milligrams per liter. In fact, if all of the leachable material in the 100 gram aliquot is leachable, the result is equivalent to milligrams per 100 grams soil. Total metal results are reported in milligrams per kilograms which is ten times greater than 100 grams.

CENPA-EN-G-M (200-1c)

SUBJECT: Sampling Report, Underground Storage Tank Remediation,
Fort Richardson, AK

d. BUILDING 35752 (See Table "Building 35752" for Chemical Test Results)

(1) Six holes, BH-12 (AP-2982) to BH-17 (AP-2987), were drilled and monitor wells were installed. Diesel fuel and BTEX contamination was found at the 10-foot level of borehole AP-2986. Levels of soil contamination greater than 30 mg/Kg diesel fuel, and BTEX 9.4 mg/Kg are marginal relative to cleanup levels cited in reference 1b.

(2) Groundwater at the site indicates that aromatics and fuel components are present. Kerosene was also present but at less than quantifiable levels. Weathering could cause misidentification of fuels.

e. BUILDING 908 South (See Table "Building 908 S" for Chemical Test Results)

Five holes, BH-18 (AP-2988) to BH-22 (AP-2992), were drilled to depths of 30 to 50 feet. No significant groundwater was encountered. However, contamination was found from near the surface to depths of 50 feet in several samples. Laboratory analysis reported diesel fuel as high as 5 grams/kilogram of soil. The highest cleanup level concentration of diesel fuel in soil is listed as 2 grams/Kg under very specific conditions. This same area had samples in excess of the listed maximum cleanup levels for benzene, toluene, ethylbenzene and xylenes (BTEX).

f. BUILDING 908 North (See Table "Building 908 N" for Chemical Test Results)

Five holes, BH-23 (AP-2903) to BH-27 (AP-2997), were drilled to depths as deep as 45 feet. Groundwater was not encountered at any depth, nor were there any monitoring wells installed. Analysis values ranged from below laboratory detection limits to near 1 gr/Kg for diesel fuel at 10 foot depths in BH-23 (AP-2993). BTEX compounds were also significant for the sample, although ADEC cleanup levels, reference 1b, were apparently not exceeded.

g. BUILDING 55804 (See Table "Building 55804" for Chemical Test Results)

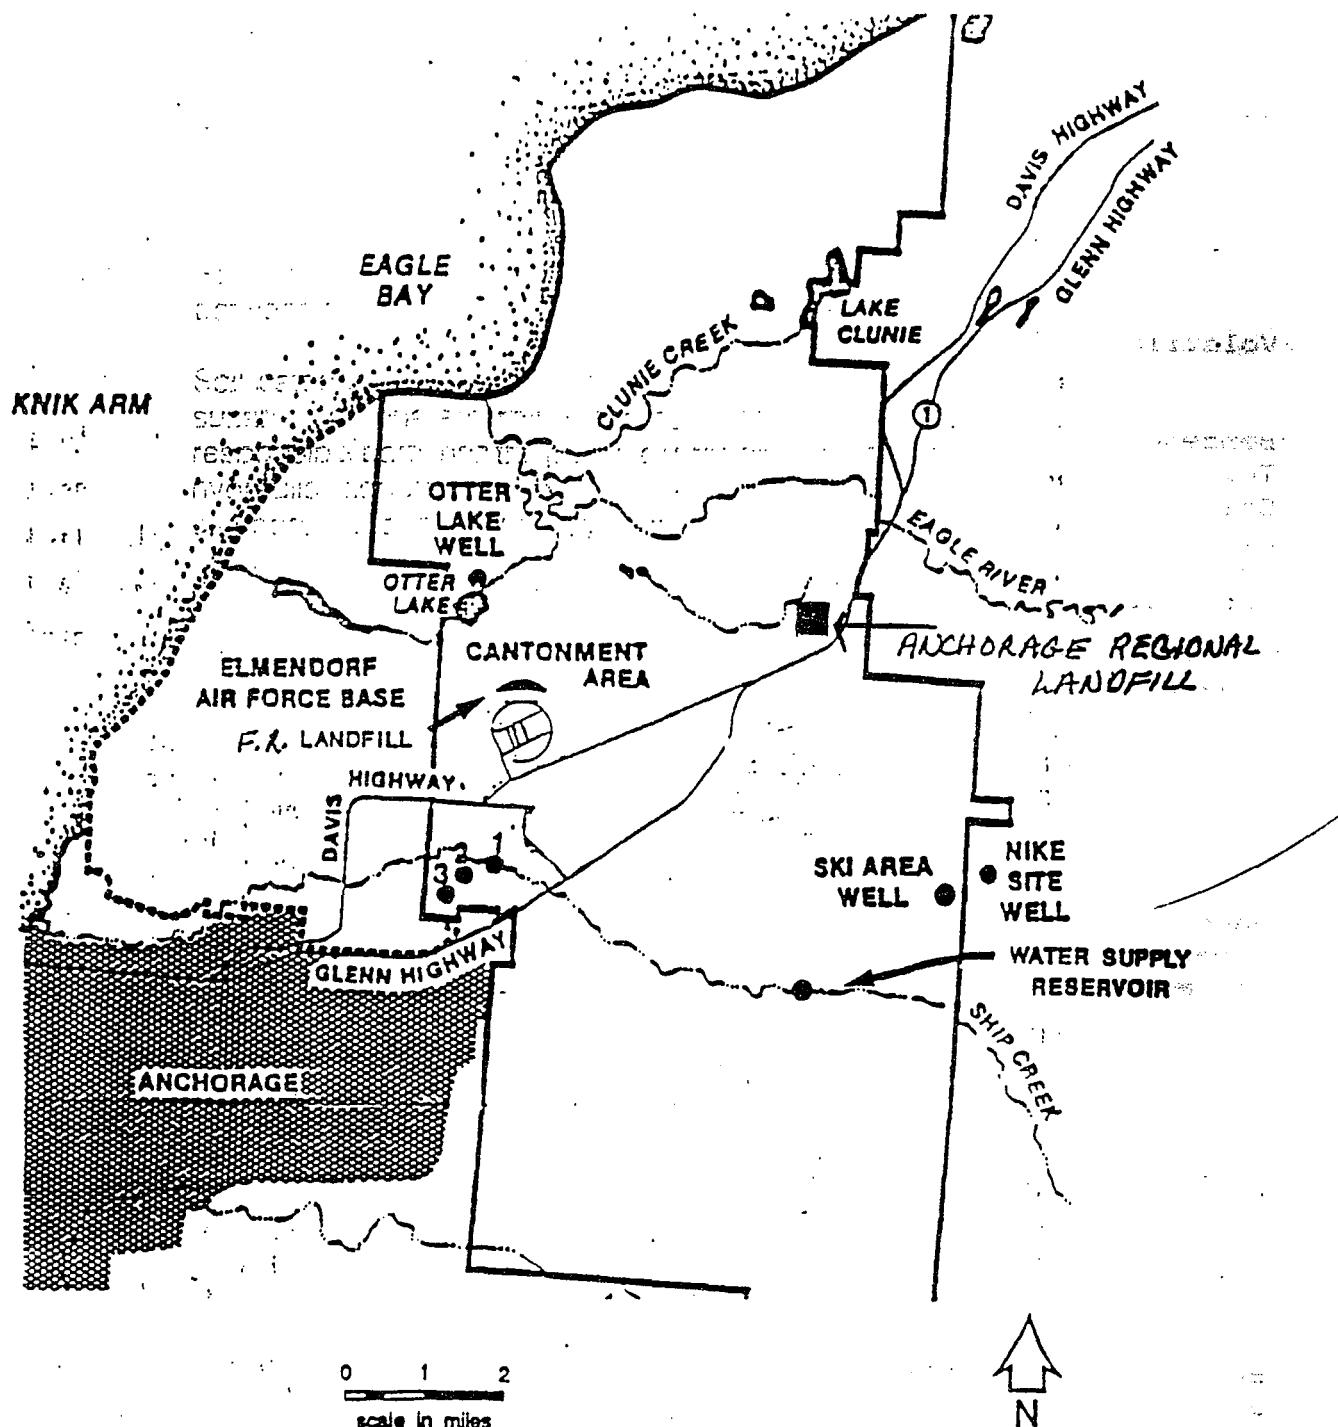

Six holes, BH-28 (AP-2998) to BH-33 (AP-3003), were drilled. Wells were not installed due to absence of groundwater. Diesel fuel and/or jet fuel reported at 10 feet depths. Diesel concentrations were reported as high as 610.0 mg/Kg. BTEX concentrations were also above laboratory detection limits at the same locations.

6. Questions should be addressed to Willard Ferrell, x-1292.
