1 Introduction

The Ahtna Solutions, LLC (Ahtna)-Arcadis U.S., Inc. (Arcadis) 8(a) Joint Venture (A-A 8(a) JV) is under contract (FA8903-23-C-0037) to the Air Force Civil Engineer Center (AFCEC) to provide remediation services to conduct a data gap investigation (DGI) and groundwater pilot study construction (PSC) in support of the groundwater response action for per- and polyfluoroalkyl substances (PFAS) treatment at site FT009P at Eielson Air Force Base (EAFB), Alaska (site). The site vicinity and location are shown on **Figure 1**.

PFAS are a group of synthetic fluorinated compounds used to make everyday products more resistant to heat, stains, grease, and water; they are also used as components in aqueous film-forming foams (AFFFs). These chemicals were used by the military to extinguish fires or for training purposes, as well as in some waterproofing and laundry activities. The chemical structures of PFAS make them very resistant to breakdown in the environment. Because of their persistence, bioaccumulation potential, mobility, and toxicity, PFAS can negatively impact human health and the environment.

Historical use of PFAS in AFFF applications at EAFB has resulted in their release to environmental media. PFAS-impacted groundwater has migrated to downgradient drinking water supplies off EAFB. As a result of impacts observed downgradient of EAFB, a pilot study is being conducted near the downgradient property boundary of EAFB to evaluate the efficacy of using colloidal activated carbon (CAC) injection to reduce the mass flux of PFAS contaminants migrating off EAFB in groundwater. This report discusses the results of the DGI.

The DGI was conducted during the 2024 field season in accordance with the Final Quality Assurance Project Plan (QAPP) for Remediation Services to Conduct Data Gap Investigation and Groundwater Pilot Study Construction in Support of Response Action for PFAS Treatment at FT009P (AFCEC 2024a). This report presents a brief project background, data quality objectives, field activities and methods, results, discussion of results, and summary and conclusions related to the DGI effort. Details pertaining to injection well design and installation will be detailed in a QAPP Addendum. CAC injection design will be the subject of a future contract following the PSC and will involve an additional QAPP Addendum.

1.1 Project Background

EAFB is located within Fairbanks North Star Borough, approximately 25 miles southeast of Fairbanks and approximately 1 mile southeast of Moose Creek, Alaska (**Figure 1**). EAFB encompasses an area of approximately 19,700 acres and current operations include industrial areas, aircraft maintenance and operations, an active runway and associated facilities, administrative offices, and residential and recreational facilities. EAFB has approximately 3,651 acres of improved or partially improved land and 16,139 acres of undeveloped land including forests, wetlands, lakes, and ponds. EAFB is in a relatively undeveloped area and is bordered on the northwest by the Moose Creek community, and east and west by undeveloped military reservation lands. The Salcha area community lies a few miles to the south. Commercial, light industrial, and residential areas, as well as recreational areas, have been developed in a narrow corridor along the Richardson Highway between EAFB and Fairbanks (AECOM 2013).

There have been ongoing PFAS-specific environmental investigations related to AFFF usage at EAFB since 2014, specifically for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS). Potential source areas on Base include fire training areas, hangars, fire stations, emergency response areas, AFFF spray test areas, AFFF spill areas, and releases from suppression systems and storage tanks (AFCEC 2021). Site-wide and off-Base groundwater has been characterized through multiple investigations, installation and sampling of

permanent and temporary monitoring wells, periodic sampling of production wells and off-Base private water supply wells, and the ongoing Phase I remedial investigation (RI) at EAFB, which will result in a refined conceptual site model. PFAS concentrations exceeding current screening levels have been detected in multiple media including soil, surface water, groundwater, porewater, and biota. Site-wide impacted areas and media are described in the Final QAPP for Remedial Investigation for PFAS at Various Sites (AFCEC 2021).

As a part of the Phase I RI, transects of vertical aquifer profile (VAP) borings installed perpendicular to groundwater flow have been completed for groundwater PFAS characterization. The VAP transect located at the northern end of the Base (Phase I RI VAP Transect 2, **Figure 1**) and in the off-Base community of Moose Creek (Phase I RI VAP Transect 6, **Figure 1**) indicate that elevated PFAS concentrations exceeding current project screening levels (PSLs) are present in shallow and deep groundwater and are migrating off-Base to the Moose Creek community and Chena Floodplain (AFCEC 2024a). Due to off-Base plume migration, the location of the pilot study area was selected on the northwest portion of EAFB, approximately 1,200 feet from the northern EAFB boundary and less than 1-mile upgradient of the Moose Creek community (**Figure 1**). The site consists of an area of approximately 4 acres east of Old Richardson Highway and north of Transmitter Road.

1.2 Project/Data Quality Objectives

The overarching goal of the DGI was to provide the data required to effectively make injection well design decisions for the pilot study and to support implementation of the pilot study with respect to injection planning and CAC loading. Individual data quality objectives (DQOs) were to investigate PFAS concentrations in both soil and groundwater, understand PFAS mass flux, evaluate general physical and chemical aquifer characteristics, and construct a monitoring well network to support the pilot study.

The site layout is included on **Figure 2**. The DQOs of the DGI and the data collected to accomplish each of the DQOs are as follows:

- Understand the lateral and vertical distribution of PFAS concentrations within saturated soil and groundwater at the site.
    - Soil sampling within the saturated zone from each deep performance monitoring well boring to provide definitive soil analytical data for PFAS
    - Installation and groundwater sampling of eight clusters of performance monitoring wells within the shallow, intermediate, and deep aquifer zones to provide baseline groundwater analytical data for PFAS
- Understand geochemical properties of groundwater at the site.
    - Groundwater sampling of geochemical parameters from each performance monitoring well to establish baseline geochemical conditions in groundwater
- Understand geotechnical properties of soils within the saturated zone at the site.
    - Soil sampling within the saturated zone from each deep performance monitoring well boring to provide geotechnical information including bulk density and porosity
- Provide data to understand the magnitude and distribution of hydraulic conductivity, discrete PFAS mass flux, and groundwater flux at each performance monitoring well to support injection strategy and design.
    - Slug testing at each performance monitoring well to provide hydraulic conductivity data

    - Soil sampling at each deep performance monitoring well boring for grain-size distribution to support injection well screen design decisions and provide supplemental hydraulic conductivity data
    - Deployment and sampling of passive flux meters (PFMs) to provide screening level data for quantitative estimates of groundwater velocities and PFAS mass flux
- Understand potential CAC interferences and competitors for binding sites.
    - A review of existing monitoring data collected in the vicinity of the site to evaluate the potential for competing constituents

As described, the analytical approach includes the use of both definitive and screening-level data. Screening-level data are associated with the analytical testing of the alcohol tracer and PFAS for the PFMs, which provide a high-resolution quantitative estimation of mass flux that will be used to make decisions regarding CAC injection loading. Definitive-level data are associated with samples collected from soil borings and monitoring wells, which will be used to provide baseline data in support of the pilot study performance monitoring.

1.3 Project Screening Levels

For PFAS in soil, analytical results are compared to the lowest values published as the most conservative values of either the Title 18 Alaska Administrative Code (AAC) Chapter 75.341 (18 AAC 75) Table B1 Method Two migration-to-groundwater soil cleanup levels (Alaska Department of Environmental Conservation [DEC] 2023) or the United States (U.S.) Department of Defense (DoD) risk screening levels published in the DoD Memorandum: *Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program* (DoD 2025), which lowered the soil screening levels for PFOS and PFOA compared to the DGI QAPP (AFCEC 2024a).

For PFAS in groundwater, analytical results are compared to the DoD risk screening levels published in the DoD Memorandum: *Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program* (DoD 2025), which set groundwater screening levels for groundwater used as drinking water based on the following hierarchy:

- November 2024 EPA Regional Screening Levels (RSLs), using a hazard quotient of 0.1 (i.e., assuming multiple PFAS are present) and a residential scenario, are used as the baseline for establishing DoD screening levels.
- MCLs are used as DoD screening levels where the RSL is less than the pooled method detection limit (MDL) identified in EPA Method 1633 (DoD 2025).
- The pooled MDL for EPA Method 1633 is used as the DoD screening level where a PFAS compound has an RSL that is less than the MDL and for which no MCL exists.

The 2025 update established DoD screening levels for 11 PFAS compounds in water: perfluorobutanoic acid (PFBA), perfluorohexanoic acid (PFHxA), PFOA, PFNA, PFBS, PFHxS, PFOS, HFPO-DA, bis(trifluoromethylsulfonyl)amine (TFSI), perfluoropropanoic acid (PFPrA), and perfluorodecanoic acid (PFDA). Prior to 2025, TFSI and PFPrA were not available for analysis in a DoD Environmental Laboratory Accreditation Program-accredited method, so they were not included in the DGI QAPP (AFCEC 2024a) and were not analyzed during the DGI. The DoD screening level for PFDA was new in the 2025 DoD memorandum (DoD 2025), so it was not included in the DGI QAPP, but PFDA was included in the Draft Method 1633 analyte list used for the DGI so the updated PFDA screening level is presented in this report. Inorganic analytes (non-PFAS) in groundwater are compared to the November 2024 MCLs (EPA 2024). **Exhibit 1** summarizes the PSLs for soil and groundwater.

Exhibit 1: Summary of Project Screening Levels for Soil and Groundwater

Analyte	Soil PSL (µg/kg)	Soil PSL Source	Groundwater PSL	Groundwater PSL Source
PFBA	7,800	Resident Soil RSL	1,800 ng/L	Tap Water RSL
PFDoA	320	Resident Soil RSL	-	-
PFHxA	3,200	Resident Soil RSL	990 ng/L	Tap Water RSL
PFNA	19	Resident Soil RSL	5.9 ng/L	Tap Water RSL
PFOA	0.070	MDL	4.0 ng/L	MCL
PFTeDA	6,300	Resident Soil RSL	-	-
PFUdA	1,900	Resident Soil RSL	-	-
PFBS	1,900	Resident Soil RSL	600 ng/L	Tap Water RSL
PFHxS	130	Resident Soil RSL	10 ng/L	MCL
PFOS	0.63	Resident Soil RSL	4.0 ng/L	MCL & Tap Water RSL
HFPO-DA	23	Resident Soil RSL	1.5 ng/L	Tap Water RSL
PFDA	0.06	MDL	0.52 ng/L	MDL
Arsenic	-	-	10 µg/L	MCL
Barium	-	-	2,000 µg/L	MCL
Cadmium	-	-	5 µg/L	MCL
Chromium	-	-	100 µg/L	MCL
Mercury	-	-	2 µg/L	MCL
Selenium	-	-	50 µg/L	MCL
Nitrate/Nitrite	-	-	10 mg/L / 1 mg/L	MCL

Notes:
For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
- = not applicable to this project or not available as a screening level
Soil PSLs are either the 18 AAC 75.341 DEC Table B1 Method Two migration-to-groundwater soil cleanup levels (DEC 2023) or DoD Resident Scenario RSLs for soil (HQ =0.1) based on the November 2024 EPA RSL update (DoD 2025), whichever is lower.
Groundwater PSLs are the MCL, the Tap Water RSLs for groundwater (HQ = 0.1) based on the November 2024 EPA RSL update, or the MDL, based on the DoD risk screening levels hierarchy (DoD 2025).

2 Field Activities and Methods

The DGI investigation activities were completed between 8 May 2024 and 6 September 2024, and included site preparation, performance monitoring well installation, soil sampling, groundwater sampling, slug testing, and PFM sampling at the DGI cluster locations. A table summarizing the sampling and analyses described in the following sections is provided as **Table 1.** The field methods used for completion of each of these activities were performed in accordance with standard operating procedures (SOPs) and technical guidance instructions included in the Final QAPP (AFCEC 2024a) and DEC Field Sampling Guidance (DEC 2024). Field documentation was recorded using electronic field devices (iPads) and paper field logs. Field sampling logs are included as **Appendix A**. A photograph log of the various field activities described in this section and the Weekly Field Reports are included as **Appendices A1 and A2**, respectively.

2.1 Permitting and Site Preparation

Permitting and site preparation activities were conducted between 8 May 2024 and 10 June 2024 and consisted of removing vegetation, conducting utility locates including a ground penetrating radar (GPR) survey, constructing temporary onsite secondary containment, and erecting a soil logging and sampling shelter.

On 8 May 2024, A-A 8(a) JV field personnel located the approximate center of each proposed monitoring well cluster location using a handheld Global Positioning System (GPS) and Eos Arrow 100® global navigation satellite system receiver and marked each location with wooden laths. The endpoints of the proposed 500-foot-long injection well transect were also located and marked. A Base Civil Engineering Work Clearance Request, Air Force Form 103, was initiated on 10 May 2024. On 15 May 2024, A-A 8(a) JV field personnel cleared vegetation in preparation for the GPR survey; 15-foot by 15-foot squares were cleared around each cluster center and an 8-foot-wide swath was cleared along the potential 500-foot-long injection well transect. On 25 May 2024, Northern Land Use Research Alaska, LLC, conducted a GPR survey, serving as a third-party utility locating contractor. Field data were collected using a Leica DS9000 GPR. On 29 May 2024, A-A 8(a) JV field personnel submitted a public utility locate request with the Alaska Digline.

On 10 June 2024, A-A 8(a) JV field personnel performed a site-wide vegetation clearing effort in preparation for monitoring well installation at the eight well-cluster locations. An onsite secondary containment cell was constructed using timbers and 12-mil impermeable liner for staging containerized investigation-derived waste (IDW) solids and liquids prior to transport to the EAFB IDW holding cells at LF003. A 20-foot by 13-foot ShelterLogic® was erected to provide shade and protection from precipitation while soil sampling and for general storage space for field equipment and materials.

2.2 Performance Monitoring Well Installation

Between 10 and 22 June 2024, the A-A 8(a) JV team and drilling subcontractor, Northern Sonic, installed eight monitoring-well clusters of three wells per cluster to be used for baseline groundwater characterization, mass flux analysis, and evaluation of aquifer hydraulics in the study area. Monitoring well drilling and field sampling was conducted in accordance with DEC Field Sampling Guidance (DEC 2024), DEC Monitoring Well Guidance (DEC 2013), and SOPs P-04, P-05, P-06, and P-07 (AFCEC 2024a). Three monitoring well clusters were installed approximately 60 feet upgradient of the proposed injection transect (CACMW-001, CACMW-002, and CACMW-003); one cluster was installed approximately 30 feet downgradient of the transect (CACMW-004); three clusters were installed approximately 60 feet downgradient of the transect (CACMW-005, CACMW-006, and CACMW-

007); and one cluster was installed approximately 90 feet downgradient of the transect (CACMW-008) (**Figure 2**). Each well cluster consisted of one well screened from the interval of 10–60 feet below ground surface (bgs), one well screened from the interval of 60–110 feet bgs, and one well screened from the interval of 110–160 feet bgs. Well construction details are provided in **Table 2** and boring and monitoring well construction logs are attached in **Appendix A3**.

During drilling of the 160-foot well borings in each well cluster, continuous soil core logging was completed to understand soil lithology following the procedures in SOP P-03 (AFCEC 2024a). Grab soil samples were collected from the saturated zone and analyzed for PFAS and geotechnical analyses (soil classification, grain size distribution, bulk density, moisture content, porosity, and organic carbon fractionation). Three soil samples were collected within 5-foot intervals where PFMs were planned to be deployed in the 50-foot screens: one sample corresponding to each depth interval of the planned wells (shallow, intermediate, and deep) (**Table 1**). Additional soil samples were collected from the 160-foot borings at clusters CACMW-005, CACMW-006, and CACMW-007, with a focus on lithologic variation and vertical depth distribution. A total of 32 primary PFAS samples and 40 primary geotechnical samples were collected. Four field duplicate samples, one matrix spike/matrix spike duplicate, two field blanks, and one equipment blank were also collected and analyzed for PFAS.

Following logging and sampling of the 160-foot borings, the 160-foot monitoring well was installed in the boring. The remaining two wells (110-foot and 60-foot) were installed in separate boreholes. Each monitoring well was constructed with 50 feet of 2-inch, 0.010-slot, stainless steel wire-wrapped screen and 2-inch, Schedule 40 polyvinyl chloride (PVC) risers, with a 2-foot sump, bottom cap, and plug (**Table 2**). Centralizers were initially planned every 30 feet to center the wells in the boreholes, but bridging of bentonite occurred at the initial installation of CACMW-001-160, causing the well to lift 7 feet when attempting to release it. This installation attempt was abandoned in accordance with DEC's Monitoring Well Guidance (DEC 2013). Going forward, centralizers were installed approximately 10 feet below the top of each well screen within the filter pack and at the bottom of the screen at the sump. The wells in each cluster were placed approximately 5 feet apart in a line parallel to the proposed injection transect and perpendicular to the generalized groundwater flow direction. The shallow and intermediate wells were installed on either side of the deep well (west and east, respectively) with the exception of CACMW-001 (**Figure 2**). Well stick-ups, completed at the surface within aluminum monument vaults, were kept to less than 1 foot above ground surface to allow for easier PFM deployment and retrieval. Protective bollards were installed around each well cluster, and wells were locked with a combination lock provided by AFCEC.

Monitoring wells were developed between 28 June 2024 and 3 July 2024 in accordance with DEC's Monitoring Well Guidance (DEC 2013) and SOP P-10 (AFCEC 2024a). Well development consisted of surging the entire length of each well screen in 2-foot intervals twice with a weighted surge block attached to a tether. Pumping was completed with a Mega-Monsoon® submersible pump after each round of surging until field parameters stabilized and turbidity was less than 50 nephelometric turbidity units. Well development logs are included as **Appendix A4**.

A monitoring well top-of-casing survey was performed by a licensed professional land surveyor, Design Alaska, on 25 July 2024. The 24 monitoring wells were surveyed using Leica GS16 dual-frequency GPS receivers with fixed height rods for the base station and rover. Elevations were established using a Leica NA2 automatic level.

Horizontal X and Y coordinates, ground surface elevation, and top-of-casing elevation were recorded for each well location. Coordinates were collected in Alaska State Plane, Zone 3, North American Datum of 1983, U.S. feet. Elevations were collected referencing the North American Vertical Datum of 1988, U.S. feet, using

differential leveling techniques to the nearest 0.01 foot. The survey report is included in **Appendix B**.

2.3 Groundwater Gauging and Sample Collection

Groundwater gauging and sample collection was conducted at the 24 monitoring wells following well development. A synoptic groundwater level gauging event was conducted on 9 July 2024 and groundwater sample collection was conducted between 9 and 16 July 2024. Groundwater gauging and sample collection was conducted in accordance with the DEC Field Sampling Guidance (DEC 2024) and SOPs P-04, P-06, P-07, P-12, and P-13 (AFCEC 2024a). Groundwater gauging and sampling logs are provided in **Appendix A5**.

The synoptic groundwater level gauging event was performed for all 24 monitoring wells in a two-hour period using a Solinst® oil-water interface meter with a 300-foot measurement tape reel. Total well depth and depth to water measurements were recorded at each well and are included in **Table 3**. Depths were measured from an established reference point on the top of the well casing at each well. Measurements were recorded to the nearest 0.01 foot. The interface meter was decontaminated between wells using Alconox® solution and PFAS-free rinse water.

Groundwater sample collection was initiated following the synoptic groundwater level gauging event. Groundwater purging and sampling were performed using low-flow sampling techniques with peristaltic pumps and high-density polyethylene (HDPE) tubing. Groundwater sample collection depth at each well coincided with the depth that a geotechnical soil sample was collected and slug testing was planned (**Table 1**). Pump intake depths varied by well cluster and were selected to provide vertical depth distribution within all well screen depths; intake depths coincided with the approximate center of the corresponding 5-foot PFM deployment interval. The sample tubing was zip-tied to a water level indicator so that the tubing intake could be deployed at the specified sample collection depth. Groundwater quality parameters including potential of hydrogen, temperature, specific conductivity, dissolved oxygen, and oxidation-reduction potential were monitored while purging using a YSI multi-parameter water-quality meter and flow-through cell, and turbidity using a turbidimeter. Groundwater parameters were recorded at a rate of approximately one reading every three to five minutes. Purging continued until the groundwater-quality parameters met stabilization criteria for three consecutive readings.

Following groundwater-quality parameters stabilization, monitoring wells were sampled for PFAS, total organic carbon (TOC), total suspended solids (TSS), total dissolved solids (TDS), alkalinity, hardness, anions (fluoride, chloride, and sulfate), nitrate-nitrite as nitrogen, total and dissolved metals (calcium, iron, manganese, magnesium) and total Resource Conservation and Recovery Act (RCRA) metals for laboratory analysis. Dissolved metals samples were field filtered using 0.45 µM field filters. Hach® in-field test kits were used to assess groundwater samples for ferrous iron (Method 8146) and sulfide (Method 8131) using a DR900 Multiparameter Portable Colorimeter. Twenty-four primary samples, three duplicate samples, two matrix spike/matrix spike duplicate samples, two equipment blank samples, two field blank samples, and one source blank sample were collected. Groundwater samples were collected in laboratory-supplied containers and packaged in coolers with ice for shipment to Pace Analytical Services in Mt. Juliet, Tennessee, for non-PFAS samples and with gel ice for shipment to Pace Laboratory Services in West Columbia, South Carolina, for PFAS samples.

2.4 Slug Testing

Between 22 and 27 July 2024, pneumatic rising head slug tests were conducted in each of the 24 newly installed monitoring wells to provide an estimate of hydraulic conductivity at targeted intervals within the well screen. Slug test intervals were selected to correspond with the approximate midpoint of a corresponding PFM deployment

depth where soil and groundwater samples were also collected (**Table 1**). Slug testing was completed with an inflatable straddle packer setup connected to PVC drop pipe, which was used to isolate each test to a discrete, 3-foot, pre-determined interval within each well screen, in accordance with SOP P-15 (AFCEC 2024a). Three slug tests were conducted per interval using the air compressor and pressure gauges to pressurize the manifold and depress the water column: two tests at approximately 0.5 pound per square inch (psi), and one test at approximately 1.0 psi. The decrease in water level following the application of pressure and return to static conditions after the release of pressure, were continuously monitored using a submerged pressure transducer connected to a laptop by a direct-read cable. Field parameters recorded; specifications used during slug testing and for subsequent analysis are included as **Appendix A6.**

2.5 Passive Flux Meter Deployment and Sampling

PFMs are self-contained permeable devices that are deployed into monitoring wells to measure groundwater and contaminant flux. The PFMs used in this study contained permeable sorbents of granulated activated carbon (GAC) and resin. After a specified time of exposure to groundwater flow, PFMs can be retrieved and sorbents extracted to estimate groundwater and contaminant flux. PFMs are a useful tool for measuring vertical variability in flux.

Passive flux meters were deployed along the length of the screen in each monitoring well to provide a discrete understanding of PFAS and groundwater flux across the vertical extent of the planned treatment zone and upgradient and downgradient of the planned CAC injection transect. A total of 216 5-foot PFMs (nine per well) were deployed and later sampled in the newly installed monitoring wells in accordance with PFM SOPs P-16 and P-17 (AFCEC 2024a). PFMs were constructed by Enviroflux, LLC, (Enviroflux) and consisted of four alternating sections of mesh sock: two containing nonionic resin (sorbent) for PFAS sampling, and two containing GAC with multiple soluble tracers for measuring groundwater flux over the deployment period. Photographic logs 08–11 contain photographs of PFMs during deployment and sampling (**Appendix A1**).

PFMs were deployed in two phases and deployment depths for each well screen interval are detailed in **Table 1**. Between 31 July 2024 and 3 August 2024, a series of five PFMs were deployed in approximately the bottom 30 feet of each well screen and suspended with Kevlar rope. Per the recommendation of Enviroflux, PFMs were deployed in the wells for approximately two weeks, then retrieved and their media sampled for laboratory analysis between 14 and 17 August 2024. After cutting the PFM mesh open with scissors, the two corresponding GAC and resin layers in each PFM were captured in zip-lock bags and composited into one sample for each type of medium (Photographs 2 and 3, Photographic Log 09, **Appendix A1**). Resin samples were sent to Pace Laboratory Services in West Columbia, South Carolina, and analyzed for PFAS by EPA Final Method 1633. GAC samples were sent to Enviroflux in Gainesville, Florida, for tracer analysis by modified Method 8015.

During the second deployment event from 21 to 23 August 2024, a series of four 5-foot PFMs were deployed in each well in approximately the upper 20 feet of the screen and suspended with Kevlar rope. PFMs were retrieved and their media sampled for laboratory analysis between 4 and 6 September 2024.

A total of 216 primary samples, 10 field duplicates, and two matrix spike/matrix spike duplicate samples (one per deployment event) were collected per sampling medium. Additionally, three resin sample blanks and eight resin batch samples were provided to the A-A 8(a) JV by Enviroflux; these samples were submitted to Pace Laboratory Services for analysis by EPA Method 1633 alongside the PFM samples. The resin sample blanks were collected from each resin container used in the construction of the PFMs; resin batch samples were spiked with a known quantity of PFAS to assess PFAS recovery by the laboratory. PFM sampling logs are included in **Appendix A7**.

2.6 Investigation-Derived Waste Management and Sampling

IDW generated during the DGI field effort included drill cuttings (soil), water recovered while drilling, monitoring well development and sampling purge water, equipment decontamination water, unused portions of PFM media, disposable sampling supplies, and disposable personal protective equipment (PPE). Republic Services, Inc., (Republic) assisted with IDW manifesting, transport, and disposal services. IDW disposal documentation is provided in **Appendix C**; IDW sample analytical results can be found in **Appendix D**.

Drill cuttings were accumulated in 1-cubic-yard bulk bags equipped with polyethylene liners. Bulk bags were staged in onsite secondary containment, constructed with 12-mil liner and timbers during site preparation activities. At the conclusion of the drilling effort, one composite waste characterization sample was collected from the 14 bulk bags. The waste characterization sample was analyzed for PFAS, toxicity characteristic leaching procedure (TCLP) volatile organic compounds, TCLP RCRA metals, ignitability, corrosivity, reactivity – cyanide, and reactivity – sulfide. Bulk bags were loaded into a lined, 20-ton, open-top shipping container after the waste characterization sample was collected. The 20-ton container was trailered to EAFB's IDW holding cells at LF003 to await receipt of waste characterization sample results required prior to manifesting, transport, and disposal. Following receipt of waste characterization sample results, the A-A 8(a) JV completed a DEC Contaminated Media Transport and Treatment or Disposal Approval Form for review and approval (**Appendix C**). Republic generated a manifest and transported the 20-ton container off site for disposal at the Republic Services Subtitle D Roosevelt Landfill in Roosevelt, Washington.

Liquid IDW including water recovered while drilling, monitoring well development and sampling purge water, and equipment decontamination water was accumulated in an intermediate bulk container staged in the onsite secondary containment described previously. Liquid IDW was periodically transferred from the site to the EAFB Wastewater Treatment System for treatment and discharge. The liquid was treated in accordance with the 2024 Operation and Maintenance Work Plan, Eielson Air Force Base, Alaska (AFCEC 2024b) and discharged in accordance with DEC Division of Water Authorization Number AKG003059 (**Appendix C)** under the AKG0030000 Hydrostatic and Aquifer Pump Testing General Permit. The EAFB Wastewater Treatment System consists of three 10,000-gallon uninsulated influent holding tanks, a pretreatment system, a treatment system, and a 14,000-gallon uninsulated effluent holding tank. The pretreatment system consists of an oil/water separator, an ozone generator and injector to disinfect and precipitate dissolved metals, a 3-cubic foot vessel containing adsorbent cellulose, a 3-cubic foot vessel containing filter sand, a 3-cubic ft vessel containing organoclay, and a 3-cubic foot vessel containing GAC. The treatment system contains a bag filter, two 4.5-cubic foot vessels containing GAC, two 5-cubic foot vessels containing PT1 ion exchange resin primarily for metals removal, four cartridge filters, two 3-cubic foot vessels containing A3F ion exchange resin, and two 3- cubic foot vessels containing LC1 ion exchange polishing resin. Flow diagrams of the pretreatment and treatment modules are attached to authorization AKG003059.

Prior to treatment and discharge, an Eielson AFB Wastewater Profile was developed for the liquid IDW using generator knowledge. The highest PFAS concentrations observed during the Eielson PFAS Remedial Investigation at Transect 02, approximately 600 feet upgradient of the DGI project location, were used as a conservative proxy for treatment and disposal. The wastewater profiling documents are included in the Permit Authorization AKG003059 - 2024 Annual Discharge Report (AFCEC, 2024c)

Unused portions of PFM media generated during PFM sampling activities, including GAC and resin, were accumulated on site in two steel, open-top, 55-gallon drums. At the conclusion of the PFM sampling effort, one

composite waste characterization sample was collected from the two drums. The waste characterization sample was analyzed for the same suite of analyses listed for the drill cuttings. Similar to the drill cuttings, the PFM IDW drums were transported to LF003 to await waste characterization sample results and receipt of necessary approvals for subsequent transport by Republic. However, the drums were transported off site to Republic's Subtitle C Grand View Facility in Grand View, Idaho (**Appendix C**).

Disposable sampling supplies and PPE included HDPE tubing, stainless-steel spoons, plastic sheeting used for lining ground and table surfaces, emptied PFM carcasses, and nitrile gloves. Disposable sampling supplies and PPE were collected in garbage bags and transported to the Fairbanks North Star Borough Landfill for disposal.

2.7 QAPP Deviations

The following deviations from the approved QAPP (AFCEC 2024a) occurred during execution of the DGI field activities.

1. Site Preparation - In QAPP Worksheet #17: Site Preparation, the buried utility clearance process indicates that A-A 8(a) JV personnel would review base buried utility schematics as they visited the various utility departments listed on the Base Civil Engineering Work Clearance Request or AF Form 103. Physical visitation at the utility departments was not required as the AF Form 103 was completed electronically and no site visits or as-built diagram reviews were required for the project location.
2. Performance Monitoring Well Installation - In QAPP Worksheet #17: Permanent Monitoring Well Installation and Soil Sampling, pre-development was specified during monitoring well installation for mitigating potential bridging when installing the sand filter pack. After installing several wells, pre-development surging was deemed unnecessary for settling the sand filter pack because the sonic vibration from the drill rig during casing removal appeared to accomplish this adequately. Pre-development was excluded from the monitoring well installation task.
3. Passive Flux Meter Deployment and Sampling - The bottom three PFMs in CACMW-001-060 became lodged above their deployment interval during retrieval on 14 August 2024. The uppermost PFM was recovered within several hours, but the two lower PFMs remained stuck in the well until their retrieval times on 15 August 2024 (**Appendix A7**). This may have a modest impact on the results by exposing these PFMs to different, shallower intervals in the well, but only for approximately one day compared to their two-week deployment period. During PFM retrieval at CACMW-002-160, the top resin section of the bottom-most PFM (132.5–137.5 feet bgs) was damaged, with approximately 10 percent resin volume remaining; the resin sample for this PFM was collected exclusively from the lower resin section (Photograph 4, Photographic Log 09, **Appendix A1**).
4. IDW Management - In QAPP Worksheet #17: Investigation Derived Waste Management, soil cuttings generated while drilling were to be placed directly into a lined, 20-ton shipping container.by the drilling subcontractor. The 20-ton container arrived on a trailer and the top of the container was too high off the ground for soil cuttings to be feasibly loaded into the container with equipment the drilling subcontractor mobilized to the project location. As a workaround, a lined, bermed, containment cell was constructed, and soil cuttings were loaded into one-yard bulk bags and staged in the containment cell. When drilling activities were complete, a telehandler was mobilized to the site and the bulk bags were loaded into the 20-ton container.

3 Data Evaluation Methods

Hydraulic conductivity data were collected through slug-testing and sieve analysis of grain-size samples. The tools and processes used to analyze the slug test and grain-size data for the estimation of hydraulic conductivity are summarized in the following sections. Groundwater and PFAS flux data were collected using PFMs. A description of flux as discussed in this report, as well as the PFM approach to quantifying groundwater and contaminant flux, are also provided in the following sections.

3.1 Slug Testing

During slug test analysis, the most complete dataset with the least noise was used in the analysis for each well. Prior to analysis, several input parameters were modified from the monitoring well construction and water column to adjust for the straddle packer. The water column was adjusted to encompass the static water level down to the bottom of the 3-foot interval tested rather than the entire water column of the well because the bottom packer cut off access to deeper portions of the well. In addition, the drop pipe connecting the top of the straddle packer to the surface was 1 inch in diameter, therefore calculations were completed based on the water column contained in the 1-inch drop pipe versus the 2-inch well casing. This result represented the “well casing” for each test.

All slug testing data were processed into displacement-time data and analyzed using AQTESOLV™ for Windows Pro 4.5 (Duffield 2007). While appropriate and applicable analytical solutions and corrections were applied following guidelines presented in The Design, Performance, and Analysis of Slug Tests – 2nd Edition (Butler 2019), the results yielded the need for multiple solutions. The majority of the slug tests showed a slight oscillatory response superimposed over an overdamped response. An inertial solution could not be utilized for the packer slug tests due to poor fit and anomalous parameters (effective water column length, damping factor, etc.). Multiple solutions including the KGS Model (Hyder et. al.,1994) and Bouwer & Rice (Bouwer & Rice 1976; Bouwer 1989) were used to analyze the center of data (KGS) and the initial test response (B&R) and an average hydraulic conductivity result was calculated. The complexity in matching the full data responses with one solution potentially stemmed from vertical influence of the sand pack. While the straddle packers isolated a single, 3-foot portion of the screened interval, the sand pack, which extends over 50 feet in each well, could not be isolated, and therefore introduced a level of uncertainty in analysis. AQTESOLV™ output files for each slug test are included in **Appendix E**. Slug testing results are discussed in Section 4.2.2.

3.2 Grain Size

The sieve data collected from grain-size samples were analyzed using a modified version of HydroGeoSieveXL (Devlin 2015) in the R program (statistical computing) to assist with processing the sieve data, generating grain-size distribution curves, and estimating hydraulic conductivity according to 15 different analytical methods. Then, a logic matrix was implemented to determine which of the 15 analytical solutions met criteria for selection for a given sample and ruled out anomalies based on a statistical analysis. Finally, a decision matrix was then implemented to provide an automated recommendation for selecting the arithmetic mean or the geometric mean as an expression of the central tendency for sieve datasets of varying sizes based on the statistical normality of the distribution. The R program produces a grain-size distribution curve with extrapolation to the theoretical 0-percent passing, a list of input parameters, a histogram of grain-size distribution (e.g., clay, sand, gravel), and a summary of calculated hydraulic conductivity for each method. Grain-size analysis exports are provided in **Appendix F**.

3.3 Passive Flux Meters

PFMs were used to measure the ambient groundwater flux and PFAS mass flux at the site. Flux refers to the mass of water and/or contaminants flowing per unit area at a measured point in a well screen averaged over a given period of time. Based upon this general definition, the units associated with mass flux are determined using the following equation:

$$flux = \frac{mass}{area \cdot time} = \frac{M}{L^2 \cdot T}$$

where: M = mass; L = length; and T = time

For consistency with common practice, the ambient groundwater flux will be discussed in terms of the specific discharge or Darcy velocity, which is the volumetric water flux (or flowrate) through a specified cross-sectional area. The resulting units are L/T and for this report the Darcy velocity will be represented with the units of centimeters per day (cm/day). For this report, the PFAS flux will be discussed in terms of mass flux ($M/L^2/T$) and represented with the units of micrograms per square meter per day (µg/m^2/day).

The PFM approach to measuring groundwater and contaminant flux is based on the use of a permeable sorptive medium that retains contaminants present in groundwater and releases pre-loaded tracers as groundwater flows through the medium. The sorptive media used for this project were GAC for measuring groundwater flux and resin for PFAS accumulation. The GAC was preloaded with a suite of five resident tracers (methanol, ethanol, iso-propanol, t-butanol, and 2,4-dimethyl-3-pentanol) containing a wide range of partitioning behavior with the GAC. The loss of tracer from the GAC when exposed to groundwater is directly related to groundwater flow velocity and the duration of device deployment in the well. GAC can be used as a sorptive medium for common organic contaminants such as chlorinated solvents (trichloroethene, tetrachloroethene, etc.), but is not a suitable medium for PFAS sorption. For PFAS, a sorptive resin is used, which can be sampled and analyzed by EPA Method 1633 for 40 PFAS.

The sorptive medium is placed into a permeable sock (i.e., the PFM) and deployed into a monitoring well (or borehole). Vertical profiles of groundwater and contaminant flux with depth can be measured by a single PFM by packing sorbent in vertical segments along the PFM. Once deployed, the PFM remains in the well for a specified amount of time before being removed. Upon retrieval, the sorbent material within the PFM is sampled for analysis of contaminant mass sorbed and tracers lost. The contaminant masses are used to calculate time-averaged contaminant fluxes, while residual resident tracer masses are used to calculate cumulative groundwater flux. An in-depth description of PFM fundamentals is provided by Hatfield et al., 2004 and field implementation by Annable et al., 2005.

4 Results and Discussion

The following results and discussion provide the data required to inform injection well design for the pilot study, to support implementation with respect to injection planning and CAC loading, and to provide baseline groundwater conditions for barrier performance monitoring. Analytical data packages for the data presented are included as **Appendix D.** Analytical data were validated by a third-party data validation firm, Arctic Data Services of Fairbanks, Alaska. Detailed Data Quality Assessments and Data Validation checklists are included in **Appendix G.**

4.1 Soil

The following sections summarize the soil results collected during the DGI, including results from PFAS and geotechnical analyses. The discussion of results focuses on understanding physical soil properties and PFAS distribution in soil at the site. The Data Quality Assessment for soil laboratory analytical data covered the 35 soil samples analyzed for PFAS and found that sensitivity, precision, accuracy, representativeness, comparability, and completeness were acceptable, and the data are usable for the purposes of this project. The data validator noted that there was an unusual frequency of manual integrations, but they appeared to have been appropriately and consistently performed. A total of 38 results were qualified due to quality control (QC) anomalies and no results were recommended for rejection (**Appendix G**).

4.1.1 PFAS Concentration and Distribution

A total of 32 primary soil samples were collected and analyzed for PFAS from the deep well soil borings at each monitoring well cluster (**Table 1**). Only ten of the 40 PFAS analyzed were detected and all but one detection of PFAS with associated PSLs were less than the associated PSL for soil (**Table 4**). Of the ten compounds detected, PFOS made up over 86 percent of the total PFAS mass detected in soil. The maximum PFOS concentration of 9.1 micrograms per kilogram (µg/kg) was detected at the CACMW-002-160 boring between approximately 77 and 82 feet bgs and exceeded the PFOS PSL of 0.63 µg/kg (**Exhibit 1**). This sample result was approximately two orders of magnitude greater than all other PFOS detections and occurred in a sample interval that had the second highest silt content (13.4 percent; **Table 5**) and highest organic content (2.55 percent, while most samples were less than 0.35 percent; **Table 6**). With the exception of this sample result, PFOS concentrations ranged from 0.03 µg/kg (CACMW-007-160 from 148.25 to 153.25 feet bgs) to 0.63 µg/kg (CACMW-005-160 from 16.75 to 21.75 feet bgs). The other PFAS detected in soil were PFHxA, PFNA, PFOA, PFHpS, PFHxS, 8:2 FTSA, PFOSA, MeFOSAA, N-EtFOSAA, results for these detections can be found in Table 4.

The greatest detection of PFAS in soil at the DGI site was PFOS at 9.1 µg/kg (CACMW-002-160, 77-82 ft bgs). This result is approximately two orders of magnitude greater than all other PFOS detections in soil, which were between 0.03 and 0.63 µg/kg (**Table 4**). The geotechnical data in **Tables 5 and 6** demonstrate that the soil at this interval has higher silt and organic content; therefore, it has a relatively high sorption capacity compared to the sand and gravel lithologies that comprise much of the targeted treatment zone.

Saturated soil samples collected in groundwater below the water table contain both groundwater (as porewater) and soil. The total concentration in soil is the sum of the PFAS mass in soil and porewater, which are expected to be in approximate equilibrium based on the project conceptual site model that the DGI study area is not a source area for PFAS.

The total concentration of PFAS sorbed to soil can be estimated using the standard equation (EPA 1994) below:

$$C_t\left(\frac{ug}{Kg}\right) = C_w \cdot \left(K_d + \left(\frac{\theta_w + \theta_a \cdot H'}{\rho_b}\right)\right)$$

Where, C_t = total soil concentration in µg/kg; C_w = porewater concentration in µg/L (from the groundwater concentration at the nearest corresponding low-flow groundwater sample); K_d = soil-water partitioning coefficient in liters per kilogram (L/kg) (from EPA 2024, 7.42 L/kg for PFOS, evaluated using a K_d range of +/- 50% [3.71 – 11.1 L/kg]); Θ_w = water-filled porosity (from **Table 6**); Θ_a = air-filled porosity (zero, since the samples are from the saturated zone); H' = Henry's Law constant (from EPA 2024), and ρ_b = bulk density (dry) in kilograms per liter (kg/L) (from **Table 6)**.

Where concentrations of PFAS in soil and porewater are in approximate equilibrium, the concentration in each respective media is governed by K_d. A representative evaluation was performed to calculate the predicted equilibrium soil concentrations based on the groundwater concentrations at the sample locations corresponding to the upper and lower ends of the observed range of PFOS detections in soil:

- The lowest PFOS detection in soil (0.03 µg/kg, at CACMW-007-160, 148.25-153.25 ft bgs).
- The highest representative PFOS detection in soil (0.63 µg/kg, at CACMW-005-160, 16.75-21.75 ft bgs). This represents the upper end of the typical range, excluding the outlier 9.1 µg/kg PFOS detection discussed above.

Groundwater data from the low-flow samples corresponding to the nearest depth of the associated soil sample at the same well cluster was used for C_w:

- 350 ng/L (0.35 µg/L) PFOS at CACMW-007-160 at 151 ft bgs.
- 1,400 ng/L (1.4 µg/L) PFOS at CACMW-005-060 at 19.6 ft bgs.

For each sample, corresponding geotechnical data presented in **Table 6** provided the remaining soil data inputs:

- Porosity (assumed to be all water-filled porosity as the samples were in the saturated zone).
  - 0.226 at CACMW-007-160, 148.25-153.25 ft bgs
  - 0.278 at CACMW-005-160, 16.75-21.75 ft bgs
- Dry bulk density (converted from pounds per cubic foot to kg/L)
  - 127.9 pounds per cubic foot (2.049 kg/L) at CACMW-007-160, 148.25-153.25 ft bgs
  - 119.6 pounds per cubic foot (1.916 kg/L) at CACMW-005-160, 16.75-21.75 ft bgs

The results of this calculation estimate the following equilibrium PFOS concentrations in soil at these locations:

- A range of 1.34 – 3.93 µg/kg PFOS at CACMW-007-160, 148.25-153.25 ft bgs vs. measured 0.03 µg/kg PFOS.
- A range of 5.40 – 15.8 µg/kg PFOS at CACMW-005-160, 16.75-21.75 ft bgs vs. measured 0.63 µg/kg PFOS.

The observed PFOS soil concentrations at these specific locations and across the DGI dataset (**Table 4**) are generally an order of magnitude lower than the range of predicted equilibrium concentrations, suggesting that soil concentrations are not equilibrated with groundwater. Since the measured soil concentrations are significantly less than predicted based on equilibrium partitioning, groundwater is the likely source of the PFOS in soil and soil

local to the DGI study area is not an ongoing source of PFOS. Since PFOS is the most prevalent PFAS constituent detected during the DGI, these results are expected to be similar for the various PFAS compounds.

The depths at which PFAS concentrations were detected varied from as shallow as 15 feet bgs to as deep as 148 feet bgs. Most of the encountered lithology was a mix of sands and gravels with limited intervals containing greater than 5 percent silts and clays based on geotechnical sample results (**Table 5**). PFAS concentrations in soil and the potential for PFAS to desorb from soil and partition back into the dissolved phase will be accounted for during injection design.

4.1.2 Geotechnical Properties

A total of 40 samples were collected for geotechnical analyses from the deep well soil borings at each monitoring well cluster (**Table 1**). Samples were analyzed for grain size, moisture content, TOC, bulk density, and porosity. Results are summarized in **Tables 5 and 6**. Sieve results from the grain-size analyses were used to estimate hydraulic conductivity with the HydroGeoSieveXL tool, as described in Section 3.2.

Grain size results indicated that the soil samples consisted of greater than 95 percent sand and gravel, which was consistent with field observations during field logging (**Appendix A3**). Fines (silt and clay) were only identified at greater than trace amounts (greater than 10 percent) in two of 40 samples (**Table 5**).

During field soil logging, several intervals of silty sand or sandy silt up to 4 feet thick were identified at each of the three upgradient well clusters CACMW-001 (0–4 feet bgs and 135–136 feet bgs), CACMW-002 (0–2 feet bgs and 4–7 feet bgs), and CACMW-003 (129–131 feet bgs); however, no large scale or laterally continuous units of fines were observed (**Appendix A3**). Silty soils were not identified at any of the downgradient well clusters.

Ranges for the remaining soil properties are as follows (**Table 6**):

- Moisture content: 0.4 to 16.1 percent
- TOC: 0.08 to 0.46 percent (0.0008–0.0046 fraction of organic carbon [Foc]), with two outliers at 1.24 percent (0.0124 Foc at CACMW-006, 21–26 feet bgs) and 2.55 percent (0.0255 Foc at CACMW-002, 77.25–88.25 feet bgs)
- Specific gravity: 2.65 to 2.69
- Bulk density (wet): 120.2 to 137.4 pounds per cubic foot
- Bulk density (dry): 103.5 to 132.2 pounds per cubic foot
- Porosity: 20.3 to 38.3 percent

Geotechnical results will be used to inform the CAC injection design and implementation during the future injection phase of the project.

4.2 Groundwater

The following sections present the groundwater results of the DGI, including results from the synoptic well gauging event, groundwater sampling, hydraulic conductivity analyses, and PFM deployment. The discussion of results focuses on understanding groundwater hydraulics, groundwater geochemistry, PFAS distribution, and PFAS mass flux at the site.

4.2.1 Groundwater Elevation and Hydraulic Gradient

The groundwater elevation map from the synoptic groundwater gauging event is presented on **Figure 3**. The horizontal hydraulic gradient was approximately 0.00043 foot per foot (ft/ft) in the shallow zone, 0.0011 ft/ft in the intermediate zone, and 0.0010 ft/ft in the deep zone. The average hydraulic gradient of the three zones is 0.00084 ft/ft, toward the north-northwest. This flow direction is consistent with general basewide groundwater flow to the north-northwest understood from previous studies.

Vertical hydraulic gradients calculated at each monitoring well cluster suggested no consistent upward or downward groundwater gradient. Upward gradients (CACMW-001, CACMW-004, and CACMW-005) ranged from 0.0002 to 0.0005 ft/ft, and downward gradients (CACMW-002, CACMW-003, CACMW-006, CACMW-007, and CACMW-008) ranged from 0.0003 to 0.001 ft/ft. Groundwater elevations from the 9 July 2024 gauging event are presented in **Table 3**.

4.2.2 Hydraulic Conductivity

Hydraulic conductivity was estimated using various methods during the DGI. The methods include: 1) slug testing using inflatable packers with analysis in AQTESOLV™ (**Table 7 and Appendix E**); 2) grain size analysis using a modified version of the HydroGeoSieveXL Tool (**Table 8 and Appendix F**); and 3) PFM results (calculated by using the Darcy velocity and dividing by the groundwater hydraulic gradient at the site, **Table 9 and Appendix H**).

Summary statistics of these results are shown in **Exhibit 2**. **Exhibit 2** also includes the Transect 02 VAP borings/slug tests from the EAFB Phase I RI (**Figure 1**) for comparison (AFCEC 2024a).

Exhibit 2: Summary and Comparison of Hydraulic Conductivity Results

Statistic	Darcy Velocity (*q*) from PFMs	Hydraulic Conductivity (*K*)			
		PFM[1]	Slug Testing	HydroGeoSieveXL Tool Using Grain Size	Eielson RI TR02 Slug Tests
feet/day					
Average	0.3	371	59	1,320	239
Minimum	0.04	45	34	0.2	27.2
Maximum	0.8	932	116	19,480	765

Notes:
For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
RI TR02 represents RI Transect 02 (AFCEC 2024a).
RI TR02 is located approximately 500 feet southeast (upgradient) of the project site.
[1]Hydraulic conductivity was calculated using the equation $K = q/i$
K = hydraulic conductivity
q = Darcy velocity
i = hydraulic gradient (0.00084), calculated as an average gradient from the shallow, intermediate, and deep zones

Key observations from the comparison presented in **Exhibit 2** are as follows:

- The three methods used to estimate hydraulic conductivity in this study (slug test, grain-size analysis, and PFMs) reveal ranges and averages that span three orders of magnitude.
- Hydraulic conductivity results from the PFMs are in good agreement with the EAFB Phase I RI Transect 02 slug test results, which were conducted using pneumatic slug test methods with 2 to 3-

foot well screens during VAP drilling activities. The overall range and magnitude between the two datasets are similar.

- Hydraulic conductivity results from the DGI slug testing may underestimate hydraulic conductivity when compared to other methods. The disagreement of the slug testing results with other methods is attributed to the vertical influence of the over 50-foot sand pack at each well, as the sand pack could not be isolated during packer testing.
- Hydraulic conductivity results from grain-size analyses likely overestimate hydraulic conductivity when compared to other methods and the Eielson Phase I RI results at Transect 02. The disagreement between the grain-size analysis results and the other datasets is likely due to the unreliability of the HydroGeoSieveXL tool to estimate hydraulic conductivity from coarse-grained soil samples (Payne et al., 2008). Grain-size analysis for estimating hydraulic conductivity is not suitable for soils with cobble-sized distributions. Cobble-sized soils (greater than 64 millimeters) were not included in the samples submitted for grain-size analysis; however, several samples contained coarse gravel (16–64 millimeters) as the primary or secondary component. The range in hydraulic conductivity determined by the grain-size analysis method suggests this method may be unreliable for the gravelly soil type at EAFB.

Based on the extended time-averaged nature of the PFM data and the consistency of the PFM hydraulic conductivity results with the nearby RI slug tests, which were conducted under more optimal conditions than the DGI slug tests, the PFM hydraulic conductivity data are likely the most representative of the pilot study area.

4.2.3 Groundwater Analytical Results

Groundwater samples were collected for PFAS and geochemical analyses (TOC, total and dissolved metals, anions, and general chemistry) during low-flow sampling at each of the 24 monitoring wells (**Table 1**). Geochemical analytical results in groundwater are presented in **Table 10** and groundwater PFAS analytical results are presented in **Table 11**. The Data Quality Assessment for groundwater laboratory analytical data covered the 27 groundwater samples (24 primary and three duplicate samples) analyzed for PFAS and found that sensitivity, precision, accuracy, representativeness, comparability, and completeness were acceptable, and the data are usable for the purposes of this project. A total of 260 results were qualified due to QC anomalies and 17 results were recommended for rejection (**Appendix G**). The results recommended for rejection by the data validator were reviewed by the A-A 8(a) JV Project Chemist and rejected; these results are represented by an “R” in **Table 11**. All the rejected results were for PFAS constituents for which a PSL does not exist, and the resulting dataset is 99.1 percent complete.

4.2.3.1 Geochemical Results

The groundwater analytical data provide baseline groundwater geochemistry and will inform the injection design for the purpose of mitigating potential interferences of non-PFAS analytes with PFAS CAC adsorption. The potential for CAC binding site competition by other contaminants potentially present in the aquifer is also discussed in the following sections. TOC concentrations ranged from 2,000 to 5,270 micrograms per liter (µg/L) and were generally lowest in the deepest wells. TOC was greater than 4,000 µg/L in samples from the shallow and intermediate wells but less than 2,500 µg/L in deep wells, except for CACMW-005-160 where TOC was 3,940 µg/L.

Concentrations of total and dissolved metals generally decrease with depth except for iron, which fluctuated in the shallow and intermediate well samples before decreasing in the deep well samples. Total and dissolved metals observations are as follows:

- Arsenic (total): 2.45 to 69.8 µg/L
- Barium (total): 104 to 225 µg/L
- Cadmium (total): all results non-detect (ND)
- Calcium: 35,900 to 59,900 µg/L (total), 35,200 to 60,600 µg/L (dissolved)
- Chromium (total): all results ND
- Iron: 2,400 to 5,470 µg/L (total), 2,300 to 5,390 µg/L (dissolved)
- Lead (total): all results ND except for CACMW-001-060 and CACMW-007-160 (0.532 and 0.515 µg/L, respectively)
- Magnesium: 9,360 to 12,700 µg/L (total), 9,490 to 12,400 µg/L (dissolved)
- Manganese: 199 to 4,160 µg/L (total), 204 to 4,060 µg/L (dissolved)
- Mercury (total): all results ND
- Selenium (total): all results ND
- Silver (total): all results ND

Results of ferrous iron and sulfide field test kits did not indicate discernible trends with depth. Ferrous iron and sulfide concentration ranges were as follows:

- Ferrous iron: 1.96 to 3.24 milligrams per liter (mg/L) (eight samples exceeded the maximum Hach test kit value of 3.30 mg/L)
- Sulfide: 0.00 to 0.10 mg/L

Trends in anion results vary by analyte. Chloride and fluoride generally decrease with depth, but sulfate fluctuates between relatively low concentrations and ND in shallow and intermediate well samples and increases in deep well samples. Ranges in concentration for each anion are as follows:

- Chloride: 3,950 to 62,500 µg/L
- Fluoride: 202 to 552 µg/L
- Sulfate: ND to 13,200 µg/L
- Nitrate-nitrite results: all results ND

Trends in general chemistry results vary by analyte. TSS do not have a discernible trend with depth; alkalinity, hardness, and TDS all exhibited a decrease in concentration in deep well samples compared to shallow and intermediate samples. Ranges for each general chemistry analyte are as follows:

- Alkalinity: 138,000 to 254,000 µg/L
- Hardness: 128,00 to 214,000 µg/L
- TDS: 197,000 to 343,000 µg/L
- TSS: ND to 51,600 µg/L

In summary, notable changes in geochemical results in groundwater were observed between the shallow/intermediate wells and the deep wells, with TOC, total and dissolved metals, chloride, fluoride, alkalinity,

hardness, and TDS all showing a decrease in concentration in the deep wells. These changes in geochemistry coincide with a decrease in PFAS concentrations in groundwater in the deep wells. Ferrous iron, sulfide, and TSS had no discernable trend with depth, and sulfate was the only analyte to increase with depth.

4.2.3.2 Other Non-PFAS Colloidal Activated Carbon Competitors

Competition for binding sites can occur when other analytes with an affinity for CAC (e.g., TOC, chlorinated solvents, petroleum hydrocarbons) are present as co-contaminants within groundwater. To understand what other competitors may be present, existing monitoring data collected in the vicinity of the site were evaluated.

In the area of the site, which is near the Base boundary, the closest known source area is WP033 (OU4), and it is approximately 2,700 feet away. The closest monitoring well (51MB1) to the planned location of the CAC barrier is approximately 350 feet downgradient. Monitoring well 51MB1 is sampled annually during the installation-wide monitoring program (IWMP) and is classified as a downgradient sentry well to assess whether groundwater contamination is migrating off the Base (EA Engineering, Science, and Technology, Inc. [EA Engineering] 2024). This well is sampled for gasoline range organics, diesel range organics, residual range organics, volatile organic compounds, semivolatile organic compounds, polyaromatic hydrocarbons, ethylene dibromide, and metals.

Only background metals (arsenic, manganese, and thallium), bis(2-ethylhexyl) phthalate, and naphthalene have been detected in monitoring well 51MB1 at concentrations at or exceeding the project action levels (PALs) of the IWMP. Analytical results and PALs for these compounds from the last eight sampling events (2015–2021) are included in **Appendix I** (EA Engineering 2024). Bis(2-ethylhexyl) phthalate has only been detected once (fall 2016) between 2012 and 2021 and is not considered to be present in groundwater at the well, but rather introduced during sampling or laboratory analysis during the fall 2016 event. Naphthalene was detected in exceedance of the PAL (0.12 µg/L) in two of the most recent nine events with results of 0.18 µg/L and 0.12 µg/L in the spring and fall of 2015, respectively. Although naphthalene concentrations were at or exceeding the PAL in two of the most recent eight events, concentrations are generally low or ND suggesting the competition between naphthalene and PFAS for CAC binding sites should be minimal.

In addition to groundwater contaminants, naturally occurring TOC can interfere with PFAS adsorption to CAC. The greatest concentrations of TOC in groundwater samples collected during the DGI occurred in samples above 106 feet bgs, and ranged from 4.07 to 5.27 mg/L. In contrast, TOC in deeper samples (114–156 feet bgs) ranged from 2.00 to 3.94 mg/L. Given TOC will compete with PFAS for CAC binding, competitive sorption may occur during injection of CAC, which will be considered during CAC injection loading design. CAC vendors will be engaged in the design process to understand potential CAC interferences and competitors for binding sites and optimize the CAC loading as needed.

4.2.3.3 PFAS Results

Groundwater samples for PFAS analysis were collected during low-flow sampling at each of the 24 monitoring wells (**Table 1**). A total of 24 PFAS analytes out of the 40 compounds analyzed were detected in groundwater. Of the 24 compounds detected in groundwater, five of the analytes had a screening level in which samples were detected at concentrations greater than the PSL. Compounds detected in groundwater exceeding their PSL include PFDA, PFNA, PFOA, PFHxS, and PFOS. The list of other compounds detected at a concentration less than their PSL or compounds without an established PSL include PFBA, PFHpA, PFHxA, PFPeA, PFUdA, PFBS, PFHpS, PFNS, PFPeS, 4:2 FTS, 6:2 FTSA, 8:2 FTSA, PFOSA, N-MeFOSA, MeFOSAA, EtFOSAA, N-MeFOSE, PFMPA, 5:3 FTCA. PFAS analytical results are presented in **Table 11**. These results will be used to understand

baseline groundwater PFAS concentrations and distribution with the aquifer and to inform the injection design for the purpose of understanding preferential PFAS sorption.

4.2.3.3.1 PFAS Composition

Groundwater sampling results indicate that greater than 85 percent of the PFAS mass in groundwater is composed of five PFAS, as shown in **Exhibit 3**. The composition of PFAS is similar between the shallow, intermediate, and deep zones. Making up between 45 and 62 percent of the total PFAS mass in groundwater, PFOS is the primary constituent in all depth zones, followed by PFHxS, 6:2 FTSA, PFHxA, and PFOA. Further discussion of PFAS concentration and distribution will focus on these five most-prevalent PFAS. Groundwater results for these PFAS are shown for the shallow, intermediate, and deep wells on **Figures 4 through 6,** respectively**.**

Exhibit 3. Summary of PFAS Composition in Low-Flow Groundwater Samples

PFAS	Percentage of Total PFAS Concentration		
	Shallow Wells	Intermediate Wells	Deep Wells
PFOS	58%	62%	45%
PFHxS	11%	11%	13%
6:2 FTSA	6%	5%	7%
PFHxA	4%	4%	4%
PFOA	5%	4%	4%
Other (34 compounds)	16%	14%	27%

Notes:
For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
The limit of detection was used for calculation purposes for non-detect values.

One factor affecting the adsorption of PFAS to CAC and the potential for barrier breakthrough is the structure of PFAS present and their respective binding affinity to CAC. Specific PFAS constituents have greater sorption affinities to CAC binding sites over others, namely perfluorosulfonic acids (PFSAs), which have a greater affinity for CAC than perfluoroalkyl carboxylic acids (PFCAs), which is attributed to the higher hydrophobicity of the sulfonate functional group relative to the carboxylate functional group. The primary PFSAs detected in groundwater include PFOS and PFHxS, which make up 59 percent and 11 percent of the PFAS mass in groundwater, respectively. The primary PFCAs detected in groundwater include PFHxA and PFOA, which both make up 4 percent of the PFAS mass in groundwater. Based on this distribution, PFSAs, which have a high affinity for CAC, make up the majority of PFAS mass at the site.

Similar to the hydrophobicity of PFAS compounds, fluorocarbon chain length exhibits a similar effect with long-chain PFAS compounds preferentially binding, and potentially displacing, shorter-chain compounds. The top four PFAS compounds, which collectively make up approximately 80 percent of the PFAS mass at the site, are long-chain compounds (**Exhibit 4**).

Exhibit 4. PFAS Classification and Chain-Length in Low-Flow Groundwater Samples

Compound	Classification	Chain-Length	Percentage of Groundwater Composition
PFOS	PFSA	Long-chain	59%
PFHxS	PFSA	Long-chain	11%
PFOA	PFCA	Long-chain	4%
6:2 FTSA	Fluorotelomer	Long-chain	6%
PFHxA	PFCA	Short-chain	4%

Notes:
For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
The limit of detection was used for calculation purposes for non-detect values.

4.2.3.3.2 PFAS Concentrations

Of the five most prevalent compounds, all but 6:2 FTSA have associated PSLs as shown in **Exhibit 5**. PFOS, PFOA, and PFHxS had PSL exceedances as indicated by the concentration ranges provided in **Exhibit 5**. The greatest concentrations of PFOS and PFOA were detected in CACMW-007-110 and the greatest concentration of PFHxS was detected in CACMW-008-110. Overall, the greatest total PFAS concentration was detected at CACMW-007-110 at 3,482.6 ng/L (**Table 11**).

Exhibit 5. Summary of PFAS Concentrations in Low-Flow Groundwater Samples

PFAS	PSL (ng/L)	Concentration Range Detected in Groundwater (ng/L)	Location and Depth of Maximum Concentration[2]
PFOS	4	190 to 2,200	CACMW-007-110 (101 feet bgs)
PFHxS	10	64 to 340	CACMW-008-110 (74 feet bgs)
6:2 FTSA	--	38 to 160	CACMW-007-110 (101 feet bgs)
PFHxA	990	18 to 120	CACMW-007-060 (51 feet bgs) CACMW-007-110 (101 feet bgs) CACMW-008-110 (74 feet bgs)
PFOA	4	17 to 120	CACMW-007-110 (101 feet bgs)
Total[1]	--	449.8 to 3,482.6	CACMW-007-110 (101 feet bgs)

Notes:
For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
-- = not available
[1] The limit of detection was used for NDs when calculating total PFAS.
[2] Three wells indicate the same maximum concentration (120 ng/L) for PFHxA.

Other compounds with PSLs that are minor components of the total PFAS in groundwater include PFBA, PFBS, HFPO-DA, and PFNA. Of these four PFAS, only PFNA was detected at concentrations greater than the PSL (5.9 ng/L). Detections of PFNA ranged from 1.0 to 16 ng/L. PFBA and PFBS were not detected above the PSL and HFPO-DA was ND in all samples.

4.2.3.3.3 PFAS Distribution

Figure 7 graphically illustrates the range in concentration of the top five PFAS in each of the shallow, intermediate, and deep wells. The narrow range in concentrations within each well interval demonstrates that

PFAS concentrations are relatively consistent laterally across the site. However, when comparing concentrations between depths, PFAS concentrations are more variable and significantly less in deep wells. PFAS concentrations within the intermediate wells are generally slightly greater than concentrations within the shallow wells, but both intervals (shallow and intermediate) contain PFAS at concentrations approximately three to four times greater on average than PFAS concentrations in the deep wells. Groundwater results for PFOS, the predominant constituent within the study-area groundwater, are shown on **Figure 8**, which illustrates the relationship between PFOS concentration and depth at upgradient and downgradient transects.

4.2.4 Passive Flux Meter Results

PFMs were used to measure the ambient groundwater flux and PFAS mass flux at nine intervals at each of the 24 newly installed monitoring wells (216 PFMs). **Table 12** provides a summary of the time-averaged PFAS mass flux measured directly from the PFM deployments. **Appendix H** is a complete summary report of the results from Enviroflux. The Data Quality Assessment for groundwater laboratory analytical data covered the 226 PFM resin samples analyzed for PFAS and found that sensitivity, precision, accuracy, representativeness, comparability, and completeness were acceptable, and the data are usable for the purposes of this project. A total of 1,108 results were qualified due to QC anomalies and two results were recommended for rejection (Appendix G). The results recommended for rejection by the data validator were reviewed by the A-A 8(a) JV Project Chemist and rejected. Both of the rejected results were for PFAS constituents for which a PSL does not exist (2-N-ethylperfluoro-1-octanesulfonamido-ethanol [EtFOSE] and 2-N-methylperfluoro-1-octanesulfonamido-ethanol [MeFOSE] in the sample CACMW-003-160-153.25-081524-FM-R) and the resulting dataset is over 99.9 percent complete.

Mass flux results from the PFMs were validated against other mass flux estimates that could be calculated for the study site and nearby vicinity and compared to the PFM results. Mass flux was calculated using the following equation:

$$J = K\ i\ C$$

where: J = mass flux; K = hydraulic conductivity; i = hydraulic gradient; C = concentration; and Darcy Velocity = Ki

Mass flux was calculated using the following two data sets for comparison to the PFM results:

1. Low-flow sample groundwater concentrations from study area monitoring wells (**Table 11**) and the PFM Darcy velocity (see Section 4.2.2), measured at the depth interval corresponding to the low-flow sample intake. It was established in Section 4.2.2 that hydraulic conductivity results from the DGI slug testing may underestimate hydraulic conductivity; therefore, these data were not used.
2. Vertical aquifer profile (VAP) groundwater concentrations and hydraulic conductivity estimates from the Eielson RI Transect 02 (**Figure 1**). At Transect 02, groundwater samples were collected using low-flow sampling techniques at isolated intervals during VAP boring installation. Hydraulic conductivity was measured via slug testing at the same interval where low-flow samples were collected. The gradient used was the horizontal hydraulic gradient calculated in the vicinity of Transect 02 (0.0012 ft/ft) based on potentiometric data obtained during the Eielson RI. The Eielson RI Transect 02 data used in this calculation are included as **Appendix J**.

Summary statistics of the PFOS mass flux results from each data set (PFM, low-flow, and Eielson RI TR02) are shown in **Exhibit 6** below. Mass flux was calculated for PFOS as it is the predominant PFAS compound in

groundwater (**Exhibit 3**) and was the most easily compared to RI Transect 02 data, since some RI samples were analyzed by methods other than EPA Method 1633 and the lists of PFAS compounds and laboratory detection limits varied between samples.

Exhibit 6. Summary and Comparison of Mass Flux Results for PFOS

Statistic	Mass Flux (µg/m²/day)		
	PFM	Low-Flow	Eielson RI TR02[1]
Average	174	82	47
Minimum	5	7	0.22
Maximum	833	388	286

Notes:
[1]RI TR02 represents RI Transect 02 (AFCEC 2024a).

The PFOS mass flux comparison indicates the PFM results are within one order of magnitude of the mass flux calculated using low-flow analytical results and from Transect 02. The PFM results are higher than the other estimates, however, the PFM data set is considerably larger than the low-flow or Transect 02 data sets and may have captured a wider range of hydraulic conditions.

It was established in Section 4.2.2 that the hydraulic conductivity calculated from the PFM Darcy velocity was in good agreement with hydraulic conductivity estimates from Transect 02. To validate the other component of mass flux, contaminant concentration, the flux averaged contaminant concentration calculated from the PFM mass flux were compared to low-flow results. The PFM flux averaged contaminant concentration was calculated by dividing the mass flux result by the Darcy velocity. The PFM flux averaged contaminant concentrations are summarized in **Table 2 of Appendix H**.

Contaminant concentrations for PFOS and PFHxS (the two most prevalent PFAS at the site) from low-flow samples and PFMs were compared by calculating the relative percent difference (RPD) between the two concentrations and plotting it against the average of the two concentrations (**Figure 9**). RPD was calculated using the following equation:

$$RPD = \frac{C_{LF} - C_{PFM}}{(\frac{C_{LF} + C_{PFM}}{2})}$$

where: C_{LF} = low-flow concentration; C_{PFM} = PFM concentration (either the PFM concentration at the low-flow interval or the average concentration for the well was used)

When the RPD is calculated between the low-flow result and the PFM result at the same depth interval, most RPDs for PFOS (71 percent) and PFHxS (75 percent) are ±100 percent, which is an acceptable tolerance for determining the magnitude of PFAS concentrations in groundwater for the purpose of determining CAC loading in the future injection design. When the RPD is calculated between the low-flow result and the average PFM result for the well, there is even better agreement with the majority of RPDs for PFOS (83 percent) and PFHxS (83 percent) between 0 and -100 percent. All low flow vs. well-average PFM result RPDs being negative for PFOS and PFHxS indicate the low-flow sample concentration is generally lower than the average PFM concentration for the well, suggesting PFMs provide a more conservative (i.e., higher) estimate of contaminant concentration. Although the low-flow concentrations are lower, all 24 low-flow sample results for PFOS and 22 of 24 low flow sample results for PFHxS are within the range of results provided by the PFMs, which span approximately one order of magnitude (**Figure 10**).

In summary, PFM mass flux results are reasonably close to other estimates calculated for the study site (low-flow) and nearby vicinity (Transect 02). The Darcy velocity provided from the PFMs was demonstrated as valid in Section 4.2.2 and the contaminant concentrations are shown to be more conservative, but within an acceptable range for meeting project goals. Thus, the PFM method of estimating mass flux is considered valid and the resultant data usable for supporting the pilot test injection design.

Key findings of the PFM results include the following:

- Groundwater flux (measured Darcy velocity) ranged from 1.1 to 24.0 cm/day with an average of 9.5 cm/day.
- An interpolation of groundwater flux results along two main transects is shown on **Figure 11.** The two transects shown include an upgradient transect (CACMW-001/CACMW-002/CACMW-003) and a downgradient transect (CACMW-005/CACMW-006/CACMW-007). Groundwater flux is generally greater at the downgradient transect. The zones of greatest groundwater flux at the upgradient transect are generally observed in the shallow zone at CACMW-002 and CACMW-003 (between 50 to 55 feet bgs) and in the deep zone at CACMW-001 (between 125 and 155 feet bgs). At the downgradient transect, the zones of greatest groundwater flux are less isolated, spanning the width of the transect, and are generally observed in the shallow zone (between 30 and 60 feet bgs) and intermediate zone (between 70 and 120 feet bgs). Overall, groundwater flux is greater downgradient and is less within the deep zone, with the exception of the elevated flux zone at CACMW-001-160 between 127 and 154 feet bgs.
- The primary PFAS components reported in the mass flux results are consistent with the low-flow groundwater sampling results discussed in Section 4.2.3. PFOS is the primary constituent in all depth zones, followed by PFHxS, 6:2 FTSA, PFHxA, and PFOA. These five PFAS make up approximately 47 to 72 percent of the PFAS mass flux (**Exhibit 7**). If compounds detected in less than five percent of samples were excluded from the calculation, these five PFAS would make up approximately 84 to 90 percent of the PFAS mass flux.

Exhibit 7. Summary of PFAS Composition in PFM Mass Flux Results

PFAS	Percentage of Total PFAS Mass Flux		
	Shallow Wells	Intermediate Wells	Deep Wells
PFOS	47%	52%	30%
PFHxS	10%	10%	8%
6:2 FTSA	5%	4%	5%
PFHxA	3%	3%	2%
PFOA	3%	3%	2%
Other compounds with >5% detections (18 compounds)	9%	8%	9%
Compounds with <5% detections (17 compounds)	23%	20%	44%

Notes:

1. For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
2. Total mass flux was calculated as the sum of mass flux for all PFAS analyzed. Where the result was ND, the LOD was used.

- The greatest measured PFOS mass flux was 832.9 µg/m^2/day at CACMW-005-110 between 72 and 77 feet bgs, as shown in **Table 12**. Overall, PFOS mass flux was measured between 5.1 and 832.9 ug/m^2/day, with an average mass flux of 172.5 µg/m^2/day.
- An interpolation of the PFOS mass flux results along the main two transects is shown on **Figure 12.** As with the groundwater flux, the two transects shown include an upgradient transect (CACMW-001/CACMW-002/CACMW-003) and a downgradient transect (CACMW-005/CACMW-006/CACMW-007). At both the upgradient and downgradient transects, the greatest mass flux zones are concentrated in the shallow and intermediate zones (10–110 ft bgs) (**Exhibit 8**), with a 10–15-foot-thick reduced flux zone present between approximately 60 and 75 feet bgs (**Figure 11**). A zone of greater flux also appears to be present at CACMW-001 along the upgradient transect between 130 and 155 feet bgs; however, mass flux is generally less below approximately 100 feet bgs based on the results observed at all deeper wells except CACMW-001. It is unclear why this deeper zone of greater flux is only observed at CACMW-001.

Exhibit 8. Average PFAS Mass Flux per Depth Interval

Shallow Zone	Average Mass Flux (µg/m^2/day)					
	PFOS	PFHxS	6:2 FTSA	PFHxA	PFOA	Total
Shallow	204.4	41.6	22.9	11.3	14.0	430.1
Intermediate	248.2	46.0	20.5	11.8	14.9	477.8
Deep	65.1	18.7	11.0	3.8	4.7	219.8

Notes:

1. For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
2. Total mass flux was calculated as the sum of mass flux for all PFAS analyzed. Where the result was ND, the LOD was used.

- Darcy velocity and PFOS mass flux are well correlated and generally follow the same trends with depth where greater groundwater velocities and PFOS mass flux are both observed in the shallow and intermediate zones and fewer fluxes are observed in the deep zone. Additionally, the deep zone at CACMW-001 is observed to have greater groundwater flux and PFOS mass flux than the deep zone in other areas of the site. Groundwater flux and PFOS mass flux also correlate within transects, where both are observed to be greater downgradient than upgradient. These correlations suggest groundwater velocity is a significant driver to the overall PFAS mass flux at the site.
- Mass discharge was estimated for PFOS and total PFAS through the cross-sectional areas of both the upgradient and downgradient transects using the mass flux results and interpolations of the data. **Exhibit 9** summarizes the mass discharge estimates. Mass discharge for PFOS is approximately 45 percent of total PFAS mass discharge at each transect.

Exhibit 9. Mass Discharge Estimates

Transect	Cross-Sectional Area (ft^2)	PFOS Mass Discharge (µg/day)	Total PFAS Mass Discharge (µg/day)
Upgradient	14,738	200,000	439,000
Downgradient	13,326	213,000	477,000

Notes:

1. For acronym definitions, please refer to the list of Acronym and Abbreviations at the front of the document.
2. Total mass flux was calculated as the sum of mass flux for all PFAS analyzed. Where the result was ND, the LOD was used.

The data presented in this section will be used in the future injection design to determine CAC loading requirements, injection volumes, and whether a parking agent will be required.

5 Summary and Conclusions

The DGI investigation activities were completed between 8 May 2024 and 6 September 2024 and included site preparation, performance monitoring well installation, soil sampling, groundwater sampling, slug testing, and PFM sampling at the eight DGI well cluster locations.

The data collected to support the conceptual site model aligned well with previous site knowledge. From a groundwater hydraulics perspective, the groundwater gradient is fairly flat (0.00043 ft/ft in the shallow zone), groundwater flow direction is to the north/northwest, and there were no consistent vertical gradients observed at the well clusters at the time of measurement. Borehole logging during drilling activities indicated that the lithology in this area of the site consists primarily of sands and gravels with limited amounts of fines down to 160 feet bgs. Hydraulic conductivity measurements were variable between collection methods; however, based on PFM results, hydraulic conductivity ranges across approximately one order of magnitude in this area of the site, with an average hydraulic conductivity of 467.8 feet per day. These results were consistent with the results from pneumatic slug tests performed upgradient at Transect 02 during the Phase I RI.

In soil, 10 PFAS compounds were detected and PFAS concentrations are generally low and do not indicate source area concentrations. Only PFOS was detected at a concentration exceeding its PSL in soil, at a single sample location. The soil concentrations are less than would be expected based on equilibrium partitioning with groundwater and are therefore likely reflective of adsorption of PFAS to the soil matrix from groundwater. PFAS concentrations in soil and the potential for PFAS to desorb from soil and partition back into the dissolved phase will be accounted for during injection design.

In groundwater, the geochemistry indicated that TOC is present between approximately 2 and 5 mg/L and should be considered during CAC injection and loading design. 24 PFAS compounds were detected in groundwater and the majority of the PFAS mass in groundwater (at least 85 to 90 percent) is composed of five PFAS (PFOS, PFHxS, 6:2 FTSA, PFHxA, and PFOA), which is generally consistent between the low-flow sampling results and the PFM mass flux results. PFNA, PFOA, PFHxS, and PFOS were detected at concentrations exceeding their respective PSLs in most groundwater samples collected from the study area. Results indicate that PFOS is the primary constituent at all locations and depths, composing at least half of the total mass. PFAS composition and concentrations are relatively similar within depth intervals and across the study area, with PFAS concentrations within the shallow and intermediate zones being approximately three to four times greater than PFAS concentrations in the deep zone.

Mass flux results from the PFMs were validated against other mass flux estimates generated from DGI low-flow groundwater sampling data and RI Transect 02 groundwater data. The PFM results were determined to be valid and reasonably consistent with the other estimates and useable for supporting the pilot test injection design.

Mass flux results indicate that the greatest mass flux zones at both the upgradient and downgradient transects are generally concentrated in the shallow and intermediate zones (10 to 110 feet bgs), with a 10 to 15-foot-thick reduced flux zone present between approximately 60 and 75 feet bgs. The Darcy velocity and PFOS mass flux results are well correlated and generally follow the same trends with depth, where greater Darcy groundwater velocities and PFOS mass flux are both observed in the shallow and intermediate zones and reduced fluxes are observed in the deep zone. Mass discharge estimates for total PFAS are estimated at 439,000 µg/day and 477,000 µg/day for the upgradient and downgradient transects, respectively. These estimates suggest that mass discharge is relatively similar at each transect and will provide a helpful baseline for future performance monitoring evaluations and will inform future CAC injection design. Installation of injection wells for future CAC injections is planned as the next phase of this project.

Details of the injection well construction and layout will be presented in the forthcoming PSC QAPP Addendum. The details of the CAC injection design, including CAC loading requirements, injection volumes, and whether a parking agent will be required, will be informed by the data presented in this DGI Report and will follow the PSC phase of the project.

(This Page Intentionally Left Blank)

Notes:
1. The lower box edge equates to the first quartile (25th percentile).
2. The line through the center of the box equates to the second quartile (median).
3. The upper box edge equates to the third quartile (75th percentile).
4. The "X" represents the mean.
5. The open circle is an outliers. Outliers were determined as any data point that exceeded a distance of 1.5 times the interquartile range from the first or third quartile.
6. The top whisker is the maximum, excluding outliers, if present. The bottom whisker is the minimum, excluding outliers, if present.
7. Acronyms:
   ng/L = nanograms per liter
   PFAS = per- and polyfluoroalkyl substances
   PFHxA = perfluorohexanoic acid
   PFHxS = perfluorohexane sulfonic acid
   PFOA = perfluorooctanoic acid
   PFOS = perfluorooctane sulfonic acid
   6:2 FTSA = 6:2 Fluorotelomer sulfonic acid

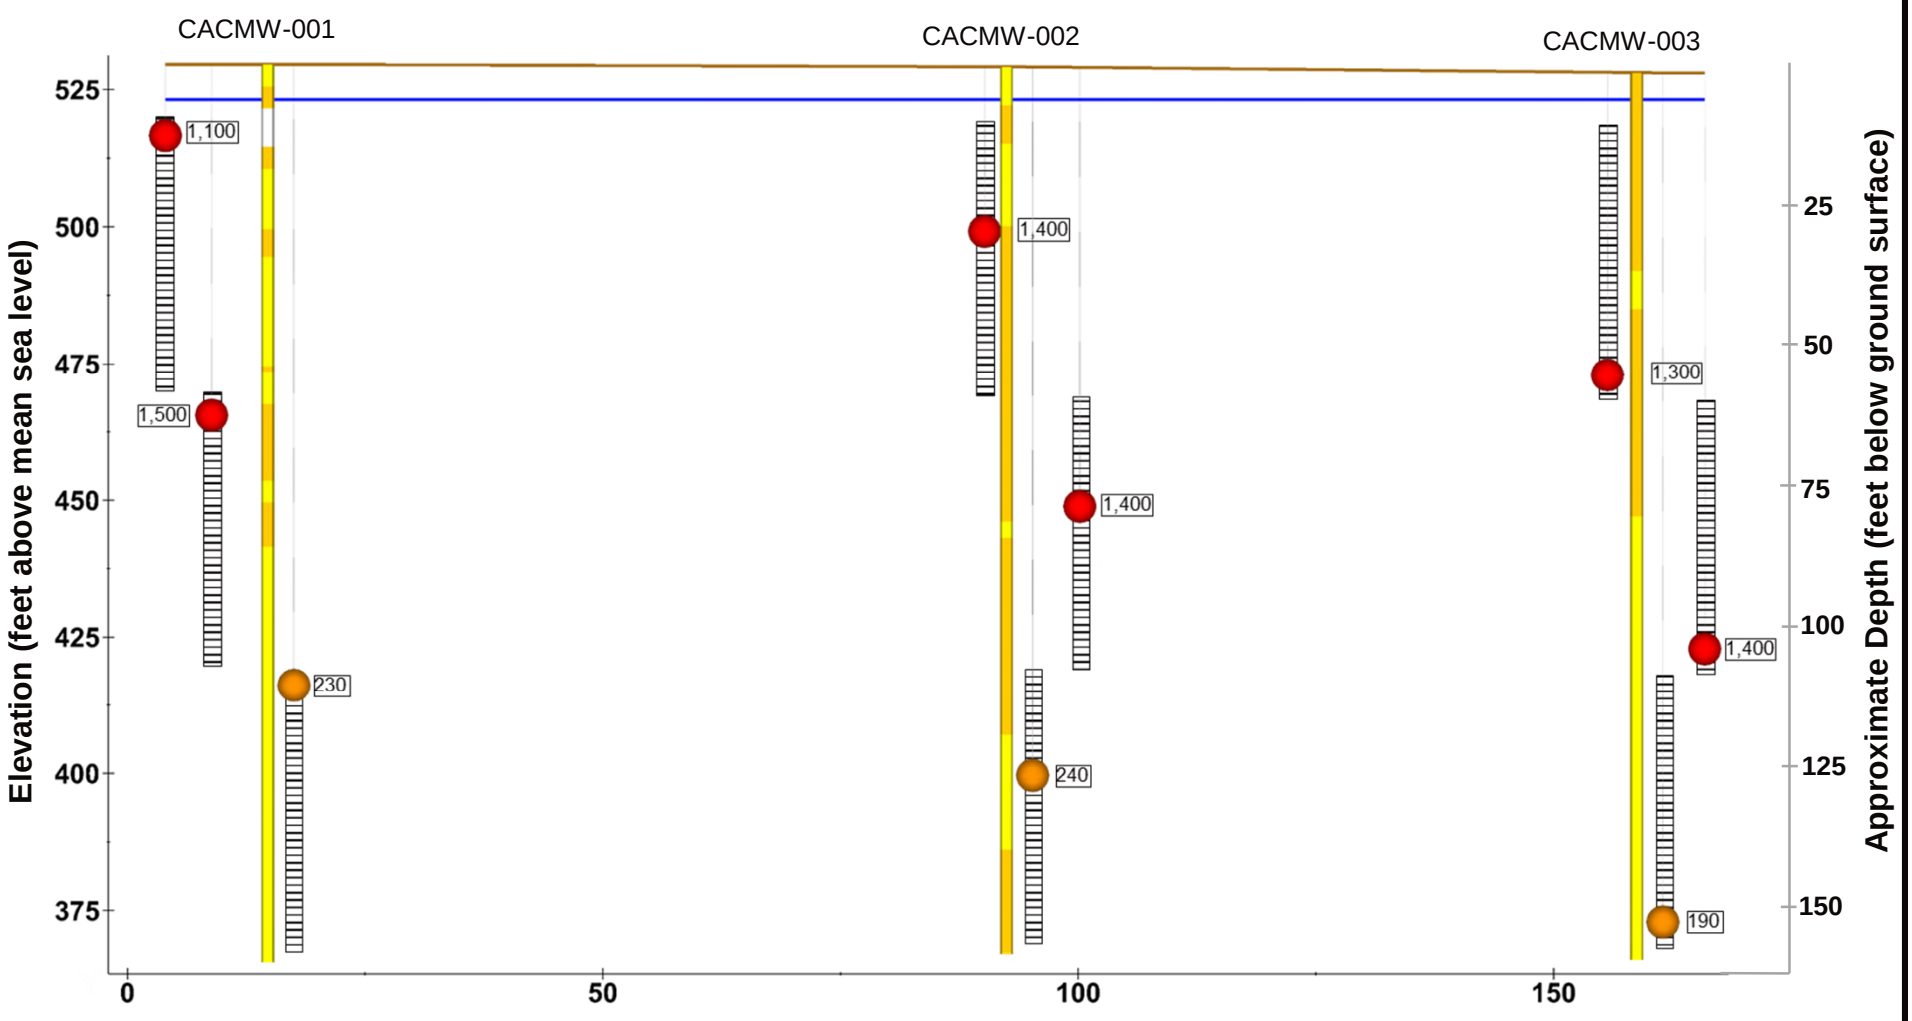
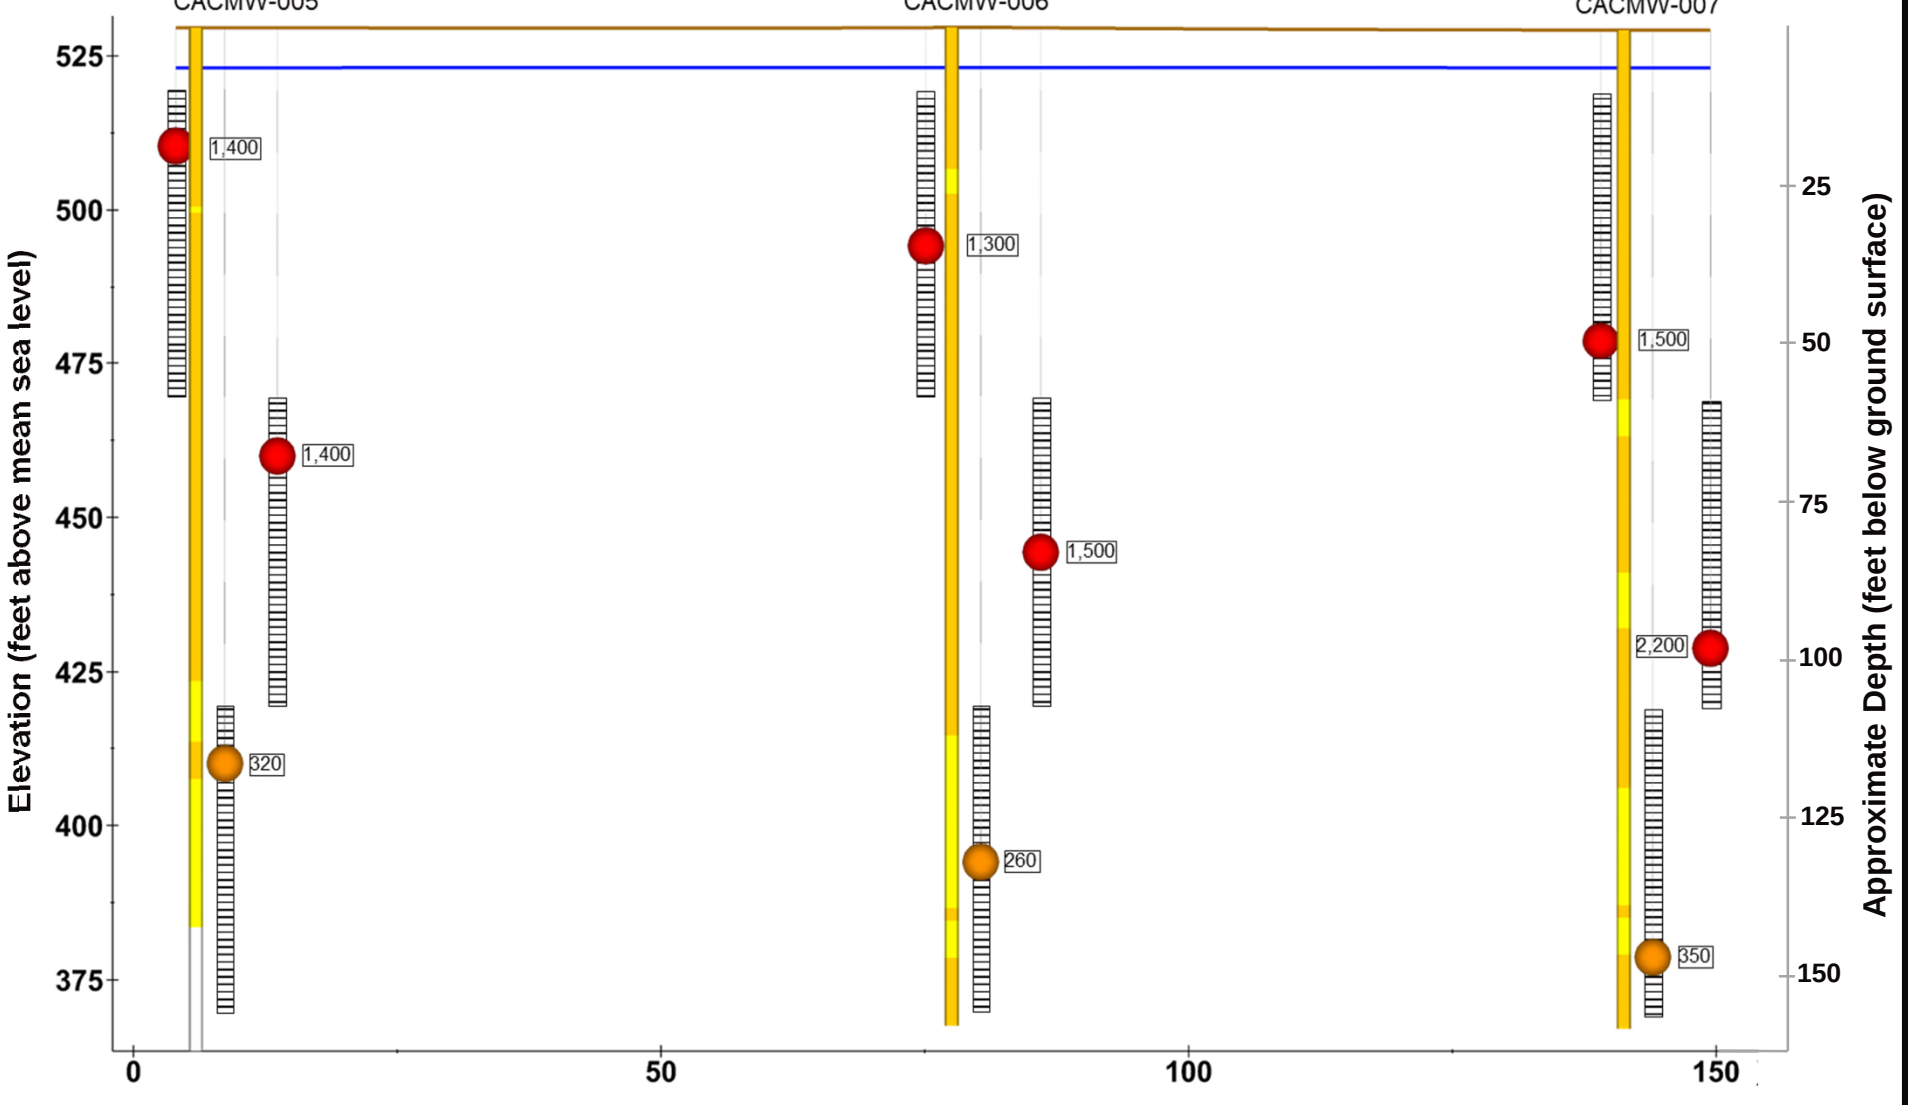
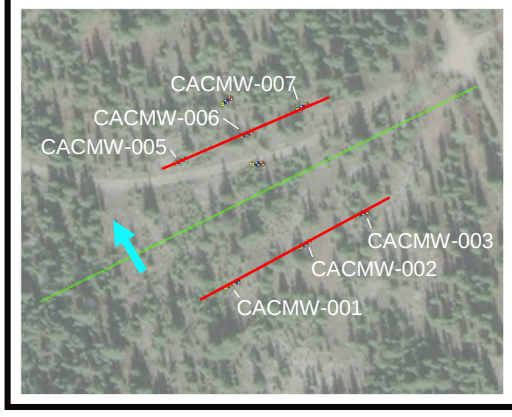
Upgradient Transect



Downgradient Transect





Inset Features
- Groundwater Flow Direction
- Proposed Injection Transect
- Cross-Section Transect

Model Features
- Ground Surface
- Water Table
- Well Screen

Lithology at Borings
- Predominantly Gravel Mixes
- Predominantly Sand Mixes
- No Recovery

PFOS Concentration in Groundwater
- Between 100x and 1,000x PSL
- Between 10x and 100x PSL
- 1,400 PFOS Concentration in ng/L

Notes
1. Vertical exaggeration = 0.575x
2. ng/L = nanograms per liter
3. PSL = project screening level (4.0 ng/L for PFOS)

Notes:

[1] = screen sank 2 ft at CACMW-001-160 during installation; groundwater samples and PFMs from the CACMW-001 cluster are offset approximately 0.5 feet lower than shown in this table. Specific sample depths for each sample are shown in the analytical results tables.

Soil samples were collected from the continuous soil cores during drilling of the 160 foot deep well at each well cluster.

X = location where PFM was deployed, sample was taken, and/or analysis was performed

X = supplemental soil sample that does not correspond exactly with a PFM interval; see analytical table/log for depth

Acronyms & Abreviations:

ft bgs = feet below ground surface

GT = Geotechnical sample

GW / ST = groundwater sample intake and slug test interval

PFAS = per- and polyfluoroalkyl substances

PFM = passive flux meter

Notes:
Wells were surveyed on July 25, 2024.
XY Coordinate system is in Alaska State Plane NAD1983, Zone 3.
Vertical elevation is in NAVD '88.
All wells were constructed with 2-inch diameter stainless steel wire-wrapped screens with 2-inch PVC risers to surface.

Abbreviations:
amsl = above mean sea level
ft bgs = feet below ground surface
TOC = top of casing

Notes:
Detected results appear in bold font.
Highlighted cells indicate detections that exceed the selected screening levels.
1 = Soil Project Screening Levels (PSLs) are either the 18 AAC 75.341 DEC Table B1 Method Two migration-to-groundwater soil cleanup levels (DEC 2023) or DoD Resident Scenario RSLs for soil (HQ =0.1) based on the November 2024 EPA RSL update (DoD 2025), whichever is lower. 2023 EPA RSL update (OUSD, 2024), whichever is lower.
ng/g is equivalent to µg/kg

* = indicates the PSL is the pooled MDL (DOD 2025)

Acronyms:

< = less than the limit of detection shown

-- = not applicable

ADEC = Alaska Department of Conservation

bgs = below ground surface
FD = Field Duplicate
N = normal sample
µg/kg = nanograms per kilogram
ng/g = nanograms per gram
OUSD = Office of the Under Secretary of Defense

Qualifiers:
B = analyte is also detected in the associated method blank
J = Estimated Value
J+ = the result is estimated with a high bias
M = manual integration performed
U = Undetected: The analyte was analyzed for, but not detected.
UJ = The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

PFAS Constituients analyzed by USEPA Method 1633
11-chloroeicosafluoro-3-oxaundecane-1-sulfonic acid (F-53B Minor)
2,3,3,3-Tetrafluoro-2-(heptafluoropropoxy)propanoic acid (HFPO-DA)
2H, 2H, 3H, 3H-perfluorodecanoic acid (7:3 FTCA)
2H, 2H, 3H, 3H-perfluorohexanoic acid (3:3 FTCA)
2H, 2H, 3H, 3H-perfluorooctanoic acid (5:3 FTCA)
4,8-Dioxa-3H-perfluorononanoic acid (DONA)
4:2 Fluorotelomer sulfonate (4:2 FTS)
6:2 Fluorotelomer sulfonic acid (6:2 FTSA)
8:2 Fluorotelomer sulfonic acid (8:2 FTSA)
9-Chlorohexadecafluoro-3-oxanonane-1-sulfonic acid (9CL-PF3ONS)
N-Ethyl perfluoroctane sulfonamide (N-EtFOSA)
N-Ethyl perfluorooctane sulfonamide ethanol (N-EtFOSE)
N-Ethyl perfluorooctane sulfonamidoacetic acid (N-EtFOSAA)
N-Methyl perfluorooctane sulfonamide (N-MeFOSA)
N-Methyl perfluorooctane sulfonamidoethanol (N-MeFOSE)
N-Methylperfluorooctane sulfonamidoacetic acid (MeFOSAA)
Nonafluoro-3,6-Dioxaheptonic Acid (NFDHA)
Perfluoro (2-Ethoxyethane) Sulfonic Acid (PFEESA)
Perfluoro-3-methoxypropanoic aci (PFMPA)
Perfluoro-4-Methoxybutanic acid (PFMBA)
Perfluorobutane sulfonic acid (PFBS)
Perfluorobutanoic acid (PFBA)
Perfluorodecane sulfonic acid (PFDS)
Perfluorodecanoic acid (PFDA)
Perfluorododecane sulfonic acid (PFDOS)
Perfluorododecanoic acid (PFDoA)
Perfluoroheptane sulfonic acid (PFHpS)
Perfluoroheptanoic acid (PFHpA)
Perfluorohexane sulfonic acid (PFHxS)
Perfluorohexanoic acid (PFHxA)
Perfluorononane sulfonic acid (PFNS)
Perfluorononanoic acid (PFNA)
Perfluorooctane sulfonamide (PFOSA)
Perfluorooctane sulfonic acid (PFOS)
Perfluorooctanoic acid (PFOA)
Perfluoropentane sulfonate (PFPeS)
Perfluoropentanoic acid (PFPeA)
Perfluorotetradecanoic acid (PFTeDA)
Perfluorotridecanoic acid (PFTrDA)
Perfluoroundecanoic acid (PFUdA)

Table 5. Soil Analytical Results – Grain Size
Data Gap Investigation Report for PFAS Treatment Pilot Study at FT009P
Eielson Air Force Base, Alaska

Location ID	Depth Interval (ft bgs)	Gravel (%)	Sand (%)	Silt (%)	Clay (%)	Laboratory Description and USCS Code
CACMW-001-160	15-16.5	51.4	46.3	1.7	0.6	WELL GRADED GRAVEL WITH SAND (GW), dark brown
	61.5-66.5	11.6	84.2	3	1.2	POORLY GRADED SAND (SP), trace gravel, dark gray
	111.5-116.5	40.9	56.3	1.8	1.0	POORLY GRADED SAND WITH GRAVEL (SP), dark brown
CACMW-002-160	27.25-32.25	19.1	78.4	2.0	0.5	POORLY GRADED SAND WITH GRAVEL (SP), dark gray

	72-77	60.7	36.2	2.6	0.5	WELL GRADED GRAVEL WITH SAND (GW), gray
	122-127	35.9	60.5	2.9	0.7	POORLY GRADED SAND WITH GRAVEL (SP), gray

Notes:

[1] Silt and clay percentages were combined in the laboratory analytical report.

Acronyms:

ft bgs = feet below ground surface
% = percent
USCS = Unified Soil Classification System
GM = silty gravel
GP = poorly graded gravel
GW = well-graded gravel
GW-GM = well-graded gravel with silt
SM = silty sand
SP = poorly graded sand
SW = well-graded sand
SP-SM = poorly graded sand with silt

Location ID	Sample Depth (ft bgs)	Moisture Content (%)	Organic Content (%)	Specfic Gravity	Bulk Density - Dry (pcf)	Porosity (%)

Notes:
cm/s = centimeters per second
ft/d = feet per day
ft/s = feet per second
ft bgs = feet below ground surface
K = hydraulic conductivity

Notes:
Detected results appear in **bold** font
Highlighted cells indicate detections that exceed the selected screening levels.
Dissolved metal analytes were field filtered prior to lab analysis.
Sample depths presented are the pump intake depths below ground surface.

[1] = Project screening levels (PSL) are the November 2024 maximum contaminant levels (MCL) (USEPA 2024)

Acronymns:
< = less than the limit of detection shown
-- = not applicable
FD = Field Duplicate
ft bgs = feet below ground surface
N = normal sample
NA = not analyzed
ng/L = nanograms per Liter
THQ = total hazard quotient
USEPA = United States Environmental Protection Agency
µg/L = micrograms per Liter

Qualifiers:
J = Estimated value
J+ = the result is estimated with a high bias
J- = the result is estimated with low bias
U = The analyte was analyzed for, but not detected.
UJ = The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
M = manual integration performed

Analytes Analyzed under Method EPA 9060
Total Organic Carbon (TOC)
Analytes Analyzed under Method USEPA 160.1
Total dissolved solids (TDS)

Notes:
Detected results appear in **bold** font
Highlighted cells indicate detections that exceed the selected screening levels.
Sample depths presented are the pump intake depths below ground surface.

[1] = Project screening levels (PSL) are the MCL, the Tap Water RSLs for groundwater (HQ = 0.1) based on the November 2024 EPA RSL update, or the MDL, based on the DoD risk screening levels hierarchy (DoD 2025).

* = indicates the PSL is the November 2024 Tapwater RSL (USEPA 2024)
** = indicates the PSL is the November 2024 MCL
*** = indicates the PSL is the pooled MDL (DOD 2025)

Acronyms:
< = less than the limit of detection shown
-- = not applicable
ASD = Assistant Secretary of Defense
FD = Field Duplicate
ft bgs = feet below ground surface
N = normal sample
NA = not analyzed
ng/L = nanograms per Liter
THQ = total hazard quotient
USEPA = United States Environmental Protection Agency
µg/L = micrograms per liter
R = The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Qualifiers:
J = Estimated Value
J+ = the result is estimated with a high bias
J- = the result is estimated with low bias
U = The analyte was analyzed for, but not detected.
UJ = The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
M = manual integration performed

Analytical List of PFAS compounds analyzed by EPA PFAS Method 1633
Perfluoroalkyl carboxylic acids
Perfluorobutanoic acid (PFBA)
Perfluorodecanoic acid (PFDA)
Perfluorododecanoic acid (PFDoA)
Perfluoroheptanoic acid (PFHpA)
Perfluorohexanoic acid (PFHxA)
Perfluorononanoic acid (PFNA)
Perfluorooctanoic acid (PFOA)
Perfluoropentanoic acid (PFPeA)
Perfluorotetradecanoic acid (PFTeDA)
Perfluorotridecanoic acid (PFTrDA)
Perfluoroundecanoic acid (PFUdA)
Perfluoroalkyl sulfonic acids
Perfluorobutane sulfonic acid (PFBS)
Perfluorodecane sulfonic acid (PFDS)
Perfluorododecane sulfonic acid (PFDOS)
Perfluoroheptane sulfonic acid (PFHpS)
Perfluorohexane sulfonic acid (PFHxS)
Perfluorononane sulfonic acid (PFNS)
Perfluorooctane sulfonic acid (PFOS)
Perfluoropentane sulfonate (PFPeS)
Fluorotelomer sulfonic acids
4:2 Fluorotelomer sulfonate (4:2 FTS)
6:2 Fluorotelomer sulfonic acid (6:2 FTSA)
8:2 Fluorotelomer sulfonic acid (8:2 FTSA)
Perfluorooctane sulfonamides
Perfluorooctane sulfonamide (PFOSA)
N-Methyl perfluorooctane sulfonamide (N-MeFOSA)
N-Ethyl perfluorooctane sulfonamide (N-EtFOSA)
Perfluorooctane sulfanamidoacetic acids
N-Methylperfluorooctane sulfonamidoacetic acid (MeFOSAA)
N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA)
Perfluorooctane sulfonamide ethanols
N-Methyl perfluorooctane sulfonamidoethanol (N-MeFOSE)
N-Ethyl perfluorooctane sulfonamide ethanol (N-EtFOSE)
Per- and Polyfluoroether carboxylic acids
2,3,3,3-Tetrafluoro-2-(heptafluoropropoxy)propanoic acid (HFPO-DA)
4,8-Dioxa-3H-perfluorononanoic acid (DONA)
Perfluoro-3-methoxypropanoic aci (PFMPA)
Perfluoro-4-Methoxybutanic acid (PFMBA)
Nonafluoro-3,6-Dioxaheptonic Acid (NFDHA)
Ether sulfonic acids
9-Chlorohexadecafluoro-3-oxanonane-1-sulfonic acid (9CL-PF3ONS)
11-chloroeicosafluoro-3-oxaundecane-1-sulfonic acid (F-53B Minor)
Perfluoro (2-Ethoxyethane) Sulfonic Acid (PFEESA)
Fluorotelomer carboxylic acids
2H, 2H, 3H, 3H-perfluorodecanoic acid (7:3 FTCA)
2H, 2H, 3H, 3H-perfluorohexanoic acid (3:3 FTCA)
2H, 2H, 3H, 3H-perfluorooctanoic acid (5:3 FTCA)

Table 12. Passive Flux Meter Results – PFAS Mass Flux
Data Gap Investigation Report for PFAS Treatment Pilot Study at FT009P
Eielson Air Force Base, Alaska

Notes:

[1]Total PFAS is the total PFAS mass flux calculated by summing the mass flux of all 40 constituents analyzed. Non-detects assumed to be equal to the LOD.

Parent sample IDs to field duplicate samples are shown in brackets

µg/m^2/day = micrograms per square meter per day

ft bgs = feet below ground surface

< = less than the limit of detection shown

LOD = limit of detection

Eielson DGI Field Status Report

AFCEC Contract Number	Project Title
FA8903-23-C-0037	Data Gap Investigation and Groundwater Pilot Study Construction for PFAS, Eielson Air Force Base, Alaska
Report Number	**Dates**
EAFB-DGI-01	06/10/24-06/15/24

HEALTH AND SAFETY

Worker protection levels: Level A ☐ Level B ☐ Level C ☐ Modified Level D ☐ Level D ☒ NA ☐

Were approved decontamination procedures used on workers and equipment as required? N/A ☐ Yes ☒ No ☐

Did all on-site personnel attend daily safety meetings? Yes ☒ No ☐

Notes: Minimum site PPE requirements: Hard hat, safety toe boots, high visibility clothing, eye protection, ear protection, and gloves (work or nitrile). Emergency response materials onsite: First aid kit, fire extinguisher, spill kit, AED, and eye wash.

WORK ACTIVITIES PERFORMED THIS PERIOD

06/10/24:

- A-A 8(a) JV and Northern Sonic field team reviewed and discussed the site health and safety plan.
- The field team performed mobilization and site preparation activities:
  - Mobilization of personnel, equipment, and materials.
  - Brush clearing to accommodate drill rig, support vehicles, and equipment at drilling locations.
  - Prepared laydown area; soil logging shelter, 20 CY soil cuttings container, and IDW containment.
  - A portable toilet was delivered to the project location.
- Northern Sonic drill rig set up at CACMW-001 well cluster.

06/11/24:

- Reviewed site health and safety plan and conducted tailgate safety meeting.
- The field team continued site preparation activities.
- Northern Sonic advanced CACMW-001-160 soil boring.
- A-A 8(a) JV logged soil lithology and collected analytical and geotechnical soil samples from CACMW-001-160 boring.

06/12/24

- Northern Sonic attempted to install monitoring well CACMW-001-160, however bentonite bridging occurred at the uppermost centralizer, approx. 40 feet below ground surface, and the well was inadvertently lifted seven feet when attempting to release the bridged bentonite. The well was decommissioned, in accordance with DEC Monitoring Well Guidance; the screen was filled with sand and the riser and remaining borehole were sealed with bentonite up to ground surface.
- The Air Force approved a deviation from the Performance Work Statement regarding monitoring well centralizer frequency and spacing. The number of centralizers installed on monitoring wells will be reduced to two centralizers per well, to mitigate the installation challenges that were encountered at CACMW-001-160 on subsequent well locations. One centralizer will be installed at the base of the screen and one centralizer will be installed 10 to 15 feet down from the top of the screen.
- Northern Sonic stepped out 5 feet, parallel to the injection well transect, to advance a boring for a second attempt at installing CACMW-001-160.

06/13/24

- Northern Sonic installed monitoring wells CACMW-001-160 and CACMW-001-110.
- After installing several wells, “pre-development surging” was deemed unnecessary for settling the sand filter pack, as vibration from the sonic drill rig appeared to adequately settle the sand pack.

06/14/24

- Northern Sonic installed monitoring well CACMW-001-060 and advanced a soil boring at CACMW-002-160.
- A-A 8(a) JV logged soil lithology and collected analytical and geotechnical soil samples from CACMW-002-160.

06/15/24

- Northern Sonic installed monitoring well CACMW-002-160, CACMW-002-110, CACMW-002-060, and set up at CACMW-003-160.
- A-A 8(a) JV collected analytical and geotechnical samples from CACMW-002-110.

HEALTH AND SAFETY

Worker protection levels: Level A ☐ Level B ☐ Level C ☐ Modified Level D ☐ Level D ☒ NA ☐

Were approved decontamination procedures used on workers and equipment as required? N/A ☐ Yes ☒ No ☐

Did all on-site personnel attend daily safety meetings? Yes ☒ No ☐

Notes: Minimum site PPE requirements: Hard hat, safety toe boots, high visibility clothing, eye protection, ear protection, and gloves (work or nitrile). Emergency response materials onsite: First aid kit, fire extinguisher, spill kit, AED, and eye wash.

WORK ACTIVITIES PERFORMED THIS PERIOD

06/17/24:

- Northern Sonic drilled and installed monitoring wells: CACMW-003-160 and CACMW-003-110. Northern Sonic drilled CACMW-003-060 boring.
- A-A 8(a) JV logged soil lithology of soil recovered from CACMW-003-160.
- A-A 8(a) JV collected analytical and geotechnical samples from soil recovered from CACMW-003-160.

06/18/24:

- Northern Sonic drilled and installed monitoring wells: CACMW-003-060, CACMW-005-160, CACMW-005-110, and CACMW-005-060.
- A-A 8(a) JV logged soil lithology of soil recovered from CACMW-005-160.
- A-A 8(a) JV collected analytical and geotechnical samples from soil recovered from CACMW-005-160.

06/19/24

- Northern Sonic drilled and installed monitoring wells: CACMW-006-160 and CACMW-006-110.
- A-A 8(a) JV shipped analytical and geotechnical soil samples collected from CACMW-001, CACMW-002, and CACMW-003 well clusters to the Pace laboratories.
- A-A 8(a) JV logged soil lithology of soil recovered from CACMW-006-160.
- A-A 8(a) JV collected analytical and geotechnical samples from soil recovered from CACMW-006-160.

06/20/24

- Northern Sonic drilled and installed monitoring wells: CACMW-006-060, CACMW-007-160 and started drilling CACMW-007-110.
- A-A 8(a) JV logged soil lithology of soil recovered from CACMW-007-160.
- A-A 8(a) JV collected analytical and geotechnical samples from soil recovered from CACMW-007-160.

06/21/24

- Northern Sonic installed CACMW-007-110 monitoring well. Northern Sonic drilled and installed monitoring well CACMW-007-060. Northern Sonic drilled CACMW-008-160 boring.
- A-A 8(a) JV logged soil lithology of soil recovered from CACMW-008-160.
- A-A 8(a) JV collected analytical and geotechnical samples from soil recovered from CACMW-008-160.

06/22/24

- Northern Sonic installed CACMW-008-160. Northern Sonic drilled and installed monitoring wells CACMW-008-110 and CACMW-008-060.
- A-A 8(a) JV began CACMW-001-060 well development. Development at CACMW-001-060 was paused due to equipment challenges, the inertial pump check valve detached from the tubing and is lodged at 61.28 feet bgs (inside the 2-foot sump). Efforts to recover the inertial pump check valve are in progress.

WORK ACTIVITIES PERFORMED THIS PERIOD

06/24/24:

- Northern Sonic drilled CACMW-004-160 and CACMW-004-110. Northern Sonic installed monitoring well CACMW-004-160.
- A-A 8(a) JV logged soil lithology of soil recovered from CACMW-004-160.
- A-A 8(a) JV collected analytical and geotechnical samples from soil recovered from CACMW-004-160.

06/25/24:

- Northern Sonic drilled CACMW-004-060, and installed monitoring wells CACMW-004-110 and CACMW-004-060.
- A-A 8(a) JV continued efforts to recover the inertia pump check valve lodged in the sump below the well screen of CACMW-001-060 during initial development efforts.

06/26/24:

- A-A 8(a) JV collected a PFAS equipment blank analytical sample from the drill rig tooling.
- A-A 8(a) JV continued efforts to recover the inertia pump check valve lodged in CACMW-001-060, recovery attempts were unsuccessful; the inertia pump check valve remains abandoned in the CACMW-001-060 sump below the screen.
- A-A 8(a) JV developed monitoring well CACMW-002-060.

06/27/24:

- A-A 8(a) JV and Northen Sonic transferred 1-CY bulk bags of soil IDW generated during drilling operations from the onsite secondary containment to the 20-ton open top container. US Ecology transported the 20-ton container to EAFB IDW accumulation area at LF003, Holding Cell #1.
- Northern Sonic began installation of protective bollards around monitoring well clusters.
- A-A 8(a) JV shipped analytical PFAS soil samples collected from clusters CACMW-004, CACMW-005, CACMW-006, CACMW-007, and CACMW-008 to the Pace laboratory.
- The US Air Force Project Team, US Army Corps of Engineers, Alaska Department of Environmental Conservation, and US Environmental Protection Agency visited the site for a tour.

06/28/24:

- A-A 8(a) JV developed monitoring wells CACMW-001-060, CACMW-001-110, and CACMW-001-160.
- Northern Sonic continued installation of protective bollards around monitoring well clusters.
- A-A 8(a) JV generated and transported 100-gallons of IDW water to the EAFB Wastewater Treatment System.

06/29/24:

- A-A 8(a) JV developed monitoring wells CACMW-002-160, CACMW-002-110, CACMW-003-060, CACMW-003-160, CACMW-003-110, and CACMW-004-060.
- Northern Sonic continued installation of protective bollards around monitoring well clusters.
- A-A 8(a) JV generated and transported 220-gallons of IDW water to the EAFB Wastewater Treatment System.

HEALTH AND SAFETY

Worker protection levels: Level A ☐ Level B ☐ Level C ☐ Modified Level D ☐ Level D ☒ NA ☐

Were approved decontamination procedures used on workers and equipment as required? N/A ☐ Yes ☒ No ☐

Did all on-site personnel attend daily safety meetings? Yes ☒ No ☐

Notes: Minimum site PPE requirements: Hard hat, safety toe boots, high visibility clothing, eye protection, ear protection, and gloves (work or nitrile). Emergency response materials onsite: First aid kit, fire extinguisher, spill kit, AED, and eye wash.

WORK ACTIVITIES PERFORMED THIS PERIOD

07/01/24:

- Northern Sonic completed protective bollard installation around CACMW well clusters.
- A-A 8(a) JV developed monitoring wells CACMW-004-160, CACMW-004-110, CACMW-006-060, CACMW-006-110, CACMW-006-160, and CACMW-007-060.
- A-A 8(a) JV transferred 450-gallons of IDW water to the EAFB wastewater treatment system Tank #2.

07/02/24:

- A-A 8(a) JV developed monitoring wells CACMW-007-160, CACMW-007-110, CACMW-008-160, CACMW-008-110, CACMW-008-060, and CACMW-005-060.
- A-A 8(a) JV transferred 230-gallons of IDW water to the EAFB wastewater treatment system Tank #2.

07/03/24:

- A-A 8(a) JV developed monitoring wells CACMW-005-160 and CACMW-005-110 to complete the monitoring well development task.
- A-A 8(a) JV transferred 150-gallons of IDW water to the EAFB wastewater treatment system Tank #2.
- Combination locks were installed on monitoring well covers for security. Combination locks were coded to 3578, which is the preferred EAFB monitoring well lock combination code.
- General site housekeeping was performed – accumulated garbage and disposable well development materials were removed and equipment and materials no longer required on site were removed.

07/04/24:

- No A-A 8(a) JV or subcontractor personnel onsite.

07/05/24:

- No A-A 8(a) JV or subcontractor personnel onsite.

07/06/24:

- No A-A 8(a) JV or subcontractor personnel onsite.

WORK ACTIVITIES PERFORMED THIS PERIOD

07/08/24:

- No A-A 8(a) JV or subcontractor personnel onsite – final preparation for baseline groundwater sample collection.

07/09/24:

- A-A 8(a) JV gauged all site monitoring wells for total depth and depth to water within a three-hour period.
- A-A 8(a) JV collected one primary groundwater sample from CACMW-001-060 and one primary groundwater sample from CACMW-001-110.

07/10/24:

- A-A 8(a) JV collected primary groundwater sample sets at CACMW-001-160, CACMW-002-060, and CACMW-003-060.

07/11/24:

- A-A 8(a) JV collected primary groundwater sample sets at CACMW-002-160, CACMW-002-110, CACMW-003-160, CACMW-003-110, CACMW-004-060, and CACMW-005-060. A MS/MSD was collected from CACMW-003-160.

07/12/24:

- A-A 8(a) JV collected primary groundwater sample sets at CACMW-005-160, CACMW-005-110, CACMW-004-160, CACMW-004-110. A duplicate sample was collected at CACMW-004-160.
- A-A 8(a) JV shipped groundwater samples collected 07-09-24 through 07-11-24 to the laboratory.

07/13/24:

- No A-A 8(a) JV or subcontractor personnel onsite.

HEALTH AND SAFETY

Worker protection levels: Level A ☐ Level B ☐ Level C ☐ Modified Level D ☐ Level D ☒ NA ☐

Were approved decontamination procedures used on workers and equipment as required? N/A ☐ Yes ☒ No ☐

Did all on-site personnel attend daily safety meetings? Yes ☒ No ☐

Notes: Minimum site PPE requirements: Hard hat, safety toe boots, high visibility clothing, eye protection, ear protection, and gloves (work or nitrile). Emergency response materials onsite: First aid kit, fire extinguisher, spill kit, AED, and eye wash.

WORK ACTIVITIES PERFORMED THIS PERIOD

07/15/24:

- A-A 8(a) JV collected primary groundwater samples at CACMW-006-060, CACMW-006-110, CACMW-006-160, CACMW-007-060, CACMW-007-110, and CACMW-007-160. A duplicate was collected at CACMW-007-060 and an MS/MSD was collected at CACMW-006-060.

07/16/24:

- A-A 8(a) JV collected groundwater samples at CACMW-008-060, CACMW-008-110, and CACWM-008-160. A duplicate was collected at CACMW-008-110.
- The field team collected field blank, equipment blank, and source blank quality control samples. DGI baseline groundwater sampling is complete.
- A-A 8(a) JV transferred 240 gallons of groundwater sampling purge water IDW to the EAFB WWTS.

07/17/24:

- A-A 8(a) JV shipped groundwater analytical samples to the Pace laboratories.

07/18/24:

- A-A 8(a) JV shipped groundwater analytical samples to the Pace laboratories.

07/19/24:

- No A-A 8(a) JV or subcontractor personnel onsite.

07/20/24:

- No A-A 8(a) JV or subcontractor personnel onsite.

HEALTH AND SAFETY

Worker protection levels: Level A ☐ Level B ☐ Level C ☐ Modified Level D ☐ Level D ☒ NA ☐

Were approved decontamination procedures used on workers and equipment as required? N/A ☐ Yes ☒ No ☐

Did all on-site personnel attend daily safety meetings? Yes ☒ No ☐

Notes: Minimum site PPE requirements: Hard hat (when overhead hazard exists), safety toe boots, high visibility clothing, eye protection, ear protection, and gloves (work or nitrile). Emergency response materials onsite: First aid kit, fire extinguisher, spill kit, AED, and eye wash.

WORK ACTIVITIES PERFORMED THIS PERIOD

08/12/24:

- No A-A 8(a) JV personnel onsite.

08/13/24:

- No A-A 8(a) JV personnel onsite.

08/14/24:

- A-A 8(a) JV retrieved and sampled three passive flux meters (PFM) from CACMW-001-060 and five PFMs from CACMW-001-110.
- PFMs in CACMW-001-060 became stuck in the well casing during retrieval, the field team was able to recover three PFMs on 08/14/24, and the two remaining PFMs on 08/15/24.

08/15/24:

- A-A 8(a) JV retrieved and sampled two PFMs from CACMW-001-060, five PFMs from CACMW-001-160, five PFMs from CACMW-002-060, five PFMs from CACMW-002-160, five PFMs from CACMW-002-110, and five PFMs from CACMW-003-160.
- The top PFM retrieved from CACMW-002-160 was damaged, likely during deployment, and most of the resin in the upper resin compartment was lost. The entire resin sample (method 1633) was collected from the lower resin compartment.

08/16/24:

- A-A 8(a) JV retrieved and sampled five PFMs from CACMW-003-110, five PFMs from CACMW-003-060, five PFMs from CACMW-004-060, five PFMs from CACMW-004-160, five PFMs from CACMW-004-110, five PFMs from CACMW-005-060, five PFMs from CACMW-005-160, and five PFMs from CACMW-005-110.

08/17/24:

- A-A 8(a) JV retrieved and sampled five PFMs from CACMW-006-060, five PFMs from CACMW-006-160, five PFMs from CACMW-006-110, five PFMs from CACMW-007-060, five PFMs from CACMW-007-160, five PFMs from CACMW-007-110, five PFMs from CACMW-008-060, five PFMs from CACMW-008-160, and five PFMs from CACMW-008-110.
- One 55-gallon open top steel drum containing excess PFM resin and granular activated carbon was generated during the PFM retrieval/sampling event.

Were approved decontamination procedures used on workers and equipment as required? N/A ☐ Yes ☒ No ☐

Did all on-site personnel attend daily safety meetings? Yes ☒ No ☐

Notes: Minimum site PPE requirements: Hard hat (when overhead hazard exists), safety toe boots, high visibility clothing, eye protection, ear protection, and gloves (work or nitrile). Emergency response materials onsite: First aid kit, fire extinguisher, spill kit, AED, and eye wash.

WORK ACTIVITIES PERFORMED THIS PERIOD

08/19/24:

- No A-A 8(a) JV personnel onsite.

08/20/24:

- No A-A 8(a) JV personnel onsite.

08/20/24:

- A-A 8(a) JV deployed four passive flux meters (PFM) in each of the following wells: CACMW-001-060, CACMW-001-110, CACMW-001-160, CACMW-002-060, CACMW-002-110, CACMW-002-160, CACMW-003-060, and CACMW-003-160.

08/22/24:

- A-A 8(a) JV deployed four (PFM) in each of the following wells: CACMW-003-110, CACMW-004-060, CACMW-004-110, CACMW-004-160, CACMW-005-060, CACMW-005-110, CACMW-005-160, and CACMW-006-060.

08/23/24:

- A-A 8(a) JV deployed four (PFM) in each of the following wells: CACMW-006-110, CACMW-006-160, CACMW-007-060, CACMW-007-110, CACMW-007-160, CACMW-008-060, CACMW-008-110, and CACMW-008-160.

ON-SITE PERSONNEL THIS PERIOD

Name	Company	Dates	Role
Nathan Hager	Ahtna	08/19/24-08/23/24	Field Team Lead/ SSHO
Nick Icks	Arcadis	08/19/24-08/23/24	Site Geologist/ Field Technical Lead
Caleb Renner	Ahtna	08/23/24	Geologist

IDW TRACKING

WATER: ONSITE STORAGE

Date Generated	Container ID	Container Type	Volume (gal)	Total Volume (gal)	Location
06/17/24	6259	250-gallon IBC	100	100	Onsite Secondary Containment
06/26/24	6259	250-gallon IBC	75	175	Onsite Secondary Containment
07/01/24	6259	250-gallon IBC	175-gallons transferred to WWTS Tank #2; onsite container empty		
07/09/24 – 07/16/24	6259	250-gallon IBC	240	240	Onsite Secondary Containment
07/16/24	6259	250-gallon IBC	240-gallons transferred to WWTS Tank #2; onsite container empty		
07/26/24	6259	250-gallon IBC	50	50	Onsite Secondary Containment
08/02/24	6259	250-gallon IBC	25	75	Onsite Secondary Containment

WATER: TRANSFERRED TO EAFB WASTEWATER TREATMENT SYSTEM (WWTS)

Date Generated	Container ID	Container Type	Volume (gal)	Total Volume(gal)	Location
06/28/24	6259	250-gallon IBC	100	100	WWTS Tank 2
06/29/24	6259	250-gallon IBC	220	320	WWTS Tank 2
07/01/24	6259	250-gallon IBC	450	770	WWTS Tank 2
07/02/24	6259	250-gallon IBC	230	1000	WWTS Tank 2
07/03/24	6259	250-gallon IBC	150	1150	WWTS Tank 2
07/16/24	6259	250-gallon IBC	240	1390	WWTS Tank 2

Note: EAFB Hazardous Waste assigned one Container ID for the IBC intended to stay onsite in secondary containment accumulating liquid and for any additional IBCs used to transfer water from the site to the WWTS.

SOIL/SOLIDS

Date	Container ID	Container Type	Quantity	Location
06/15/24	6234	20 CY Connex	0	Onsite
06/14/24	6234	Bulk Bag	1 CY	Onsite Secondary Containment
06/15/24	6234	Bulk Bag	1 CY	Onsite Secondary Containment
06/15/24	6234	Bulk Bag	1 CY	Onsite Secondary Containment
06/17/24	6234	Bulk Bag	2 CY	Onsite Secondary Containment
06/18/24	6234	Bulk Bag	2 CY	Onsite Secondary Containment
06/19/24	6234	Bulk Bag	1 CY	Onsite Secondary Containment
06/20/24	6234	Bulk Bag	2 CY	Onsite Secondary Containment
06/21/24	6234	Bulk Bag	1 CY	Onsite Secondary Containment
06/22/24	6234	Bulk Bag	2 CY	Onsite Secondary Containment
06/25/24	6234	Bulk Bag	1 CY	Onsite Secondary Containment
06/27/24	6234	All Bulk Bags Loaded Into 20-ton Container, ~11 CY		
06/28/24	6234	20-ton container	Soil IDW 20-ton Container Transported from Project Location to LF003	
08/14/24	6516	55-gallon steel drum	1x55-gal	Onsite

Note: EAFB Hazardous Waste assigned one Container ID for the 20-ton container and all individual Bulk Bags as the Bags were eventually consolidated into one container. 1 CY Bulk Bags were used, however not all bags were filled completely, therefore the approximate total quantity of 11 CY reflects several partially filled bags.

ft -bmp - feet below measuring point
mV-millivolts
mg/L- Miligrams per liter
NTU - Nephelometric Turbidity Units

°F / °C- Degrees Fahrenheit/Celsius
gpm - gallons per minute
DTW - depth to water

mS/cm-Milisiemens per centimeter
ft-feet
in - Inches

Field Parameter/Stability Guidance: Three consecutive readings - pH (± 0.1 s.u), specific conductance (± 3% mS/cm), temperature (± 3% °F/°C), turbidity (±10% when turbidity is ≤ 10 NTU), DO (10% mg/L), ORP (±10 mV)

Notes:
ags - above ground surface
ft - feet
H2O - water
ID - identification
psi - pounds per square inch
* Transducer files not found; slug test analysis not completed

Passive Flux Meter Sampling Log

Project Number:	30167435 - AFCEC/USACE Alaska Eielson AFB PFAS	**Client:**	AFCEC	**Well ID:**	CACMW-001-060	**New Well:**	yes
Project Name/Location	Eielson AFB DGI-PSC	**Measuring Point:**	TOC	**Type of Sample Point:**	Groundwater Well		
Duplicate ID:	N/A	**MS/MSD Sample ID:**	N/A				

Deployment

Deployment Date:	7/31/2024	**Deployment Time:**	11:30:00	**Deployment Technician Name:**	Nicholas Icks	**Weather Condition:**	Cloudy		
Temperature:	55	**Depth to Groundwater:**	7.5	**Total Well Depth:**	60.44	**Depth Top of PFM:**	32.5	**Depth Bottom of PFM:**	58.5

PFM Number	PFM Serial Number	Deployment Depth
1	45	58.5
2	46	53.25
3	47	48
4	48	42.75
5	44	37.5

Deployment Comments: N/A

Retrieval and Sampling

Retrieval Date:	8/14/2024	**Retrieval Time:**	09:15:00	**Retrieval Technician Name:**	Nicholas Icks	**Weather Condition:**	Sunny
Depth to Groundwater:	0	**Total Well Depth:**					

Sample Type	PFM Number Sampled	Sample ID	Sample Date	Sample Time	Sample Depth Interval	Analytical Methods	Container Type	Number of Containers	Preservative
PFM Resin	5	CACMW-001-060-37.5-081424-FM-R	8/14/2024	09:30:00	32.5-37.5 feet	USEPA Method 1633/ENV-WCOL-0158	3 oz/90 mL linerless polypropylene straight-sided jar	1	Cool to <6 deg C

RE: Ground-Penetrating Radar Analysis of Buried Utility Locates at the PFAS Data Gap Investigation & Groundwater Pilot Study Construction Project Location, Eielson AFB, Alaska

Mr. Rhodes,

In April of 2024, Ahtna Solutions, LLC contracted Northern Land Use Research Alaska, LLC (NLURA) to conduct a Ground-Penetrating Radar (GPR) survey in response to a request from the Air Force Civil Engineer Center (AFCEC) for environmental remediation services to conduct a data gap investigation (DGI) and groundwater pilot study construction (PSC) project in support of the groundwater response action for per- and polyfluoroalkyl substances (PFAS) treatment at Site FT009P (DGI-PSC Project) at Eielson Airforce Base (AFB). While the presence of utilities was not anticipated, the AFCEC requested a third-party utility location (GPR survey) as a precaution. NLURA deployed a field crew and collected GPR data in May 2024. This letter serves as the report of findings for the GPR survey completed at the DGI-PSC project location on Eielson AFB.

1. Project Location

The DGI-PSC Project is located on Eielson AFB, approximately 20 miles (mi.) (32.2 kilometers [km]) southeast of Fairbanks and partially connected to the eastern bank of the Tanana River (Table 1). The DGI-PSC Project Area is located off Transmitter Road within Eielson AFB, approximately 0.5 mi. (0.8 km) from the main gate (Figure 1). The Project Area contains 24 potential groundwater monitoring well locations organized into eight 10-by-10-foot (ft.) (3.05-by-3.05 meter [m]) proposed monitoring well cluster areas (CACMW-001 to 008) and an approximate east-west trending, 500-ft. long injection well transect (Transect) located amid the proposed monitoring well cluster areas.

2. GPR Methodology

NLURA GPR Specialists Rob Bowman and Amelia Jansen conducted GPR survey on May 25, 2024. Weather conditions were rainy during GPR survey for the Project. While in the field NLURA established eight survey grids and a single linear survey transect within the Project Area (Figure 2). The survey grids were established for the well cluster areas (CACMW-001 to 008) and straddled an unpaved access road. The single 500-ft. (152.4-m) linear survey for the Transect paralleled the unpaved access road.

The location of transect lines and central markers were collected using a Stone X receiver and Samsung tablet. GPR field data was collected using a Leica DS9000 GPR (Table 2).1 Table 3 displays the localized stratigraphic information used to calculate the area's Relative Dielectric Permittivity (RDP).

NLURA conducted GPR survey of the proposed well cluster areas, which consisted of three transects spaced at 1 m (3.28 ft.) within each cluster area. NLURA's GPR survey coverage of the Transect consisted of two transects spaced at 1-m (3.28-ft.). Transect deviations occurred when the ground was too uneven or disturbed (i.e., large holes) to collect data, and the survey was adjusted to accommodate those deviations without losing valuable information (see Figure 3). At the location of CACMW-001, a slight surface depression was recorded (Figure 2, Anomaly Line 1), surrounding the central marker was a rectangular-shaped disturbance, possibly from bulldozer activity (Figure 4). This disturbance did not require deviation from the transect but was noted in case it correlated with GPR anomalies.

3. GPR Data Analysis and Results

NLURA examined two-dimensional (2D) radiogram depth profiles of the GPR data to identify anomalies that could be associated with buried utilities or other buried detritus. Figure 5 illustrates how anomalies were noted within the data. Potential utility anomalies usually appear as hyperbolas or columns within the GPR data, buried pipe or conduit is often identified in cross-section, where hyperbolic anomalies are identified in linear orientation, in close proximity, and are mapped out spatially. The survey identified a total of 43 individual anomalies (four linear and 39-point locations) within the eight survey grids and single transect (see Table 4). The anomalies remained relatively shallow, most laying above 3.50 ft. (1.07 m).

Seventeen anomalies were identified in association with CACMW001-008. Two anomalies in these locations were identified as linear, while 15 were point anomaly locations. Twenty-six anomalies were identified in association with Transect. Two anomalies identified within the area of Transect were noted as being linear and the remaining 24 are singular points. All identified anomalies ranged from 0.44 to 14.76 ft. (0.13 to 4.50 m) in depth.

NLURA has provided GPS data as part of this letter report. The associated GPS data can be cross-referenced to locate the anomalies spatially, on the ground.

[1] Previous research conducted at both Alaskan archaeological sites and utility locates suggests that collecting radar pulse data using a distance-based data collection domain works best for acquiring this type of field data (Bowman et al. 2013; Bowman and Combs 2015; Bowman 2013; Urban et al. 2016). Accordingly, the device selected was designed with distance-based GPR data.

4. Summary and Conclusions

NLURA conducted GPR survey of the DGI-PSC Project Area, which included eight proposed monitoring well cluster areas and a single survey transect that parallels the access road to. In total, 43 anomalies were detected. Based on the signature and depth of the anomalies, the four linear anomalies appear to be discontinuous, which may suggest association with fragments of abandoned utilities, such as pipes or conduit. The 39-point anomalies (especially the shallower ones) most likely represent buried metallic debris, drums, or other refuse, as evidenced by the surrounding surface and partially buried items around the survey area. Based on the data collected, it is NLURA's professional opinion that none of the anomalies identified represent active utilities.

5. Limitations

This Project was carried out, and this report was prepared, following generally accepted professional practices for the nature and conditions of the work completed in the same or similar localities, when the work was performed. It is intended for the exclusive use of Ahtna Solutions, LLC and their associated clients. This report is not meant to represent a legal opinion.

We do not warrant that we have identified all utilities, present at the referenced properties, as these may be hidden so that only extensive excavations (not included in our scope of work) will reveal them. No other warranty, expressed or implied, is made.

The use of GPR technology is not error-free and there are limitations on the use of GPR to locate buried or embedded objects in the ground or in structures which may make GPR data difficult or impossible to interpret. This GPR report is based upon interpretation of the data collected and is provided solely for illustration and informational purposes. NLURA is not responsible for any loss or damage caused, arising from the use of or reliance on the data collected or the report generated.

Any questions regarding our work and this letter report are welcome and should be referred to NLURA GPR Specialist Robert Bowman at (907) 328-0999 or NLURA General Manager Lindsay Simmons at (907) 345-2457.

Sincerely,

Robert C. Bowman, MA, RPA

Senior Project Archaeologist / GPR Specialist

SURVEY REPORT

SCOPE OF WORK

Survey the locations of 24 performance monitoring wells.

DATE OF WORK

Survey field work was performed July 25, 2024.

EQUIPMENT USED

Leica GS16 dual frequency GPS receivers with fixed height rods for base station and rover. Elevations were established on monitor wells with a Leica NA2 automatic level.

SURVEY CONTROL

The basis for horizontal and vertical survey control is a recovered primary aluminum monument in PVC casing named "GATE". Coordinates and elevations were obtained from a 3.5 hour static GPS session processed by the NGS OPUS utility. Overall RMS on the position: 0.019(m). An additional recovered brass cap in concrete utilidor named "EF 16A RESET" was utilized as a check point for this survey.

A temporary benchmark was established by RTK GPS at the project site consisting of a 6" spike in a spruce tree. Multiple GPS observations were made to obtain an average elevation for the benchmark.

Coordinates are Alaska State Plane, Zone 3, NAD83, US feet. Elevations are NAVD88 vertical datum, feet.

SURVEY PROCEDURE

Coordinates for the monitor wells were measured with RTK GPS from the base station at "GATE". Elevations were measured from the temporary benchmark with differential leveling techniques to the nearest 0.01 feet.

DELIVERABLES

Tabulated results of the survey in Excel format; raw GPS data files of the survey; processing results of the survey data; OPUS processing report of the survey control base station; and image documentation for PDOP and number of satellites acquired for each monitor well surveyed.

Investigation-Derived Waste Documentation

ALASKA DEPARTMENT OF ENVIRONMENTAL CONSERVATION
DIVISION OF SPILL PREVENTION AND RESPONSE
Contaminated Sites and Prevention Preparedness and Response Programs

Contaminated Media Transport and Treatment or Disposal Approval Form

HAZARD ID # or SPILL ID #	NAME OF CONTAMINATED SITE OR SPILL	
26773 / 26997	Eielson AFB Basewide (AKA Sitewide) PFAS / Eielson AFB AFFF Area #4 Fire Training Area (FT009)	
CONTAMINATED SITE OR SPILL LOCATION – ADDRESS OR OTHER APPROPRIATE DESCRIPTION		
64.70116427370006, -147.1350420121095		
CURRENT PHYSICAL LOCATION OF MEDIA	**SOURCE OF THE CONTAMINATION (DAY TANK, FIRE TRAINING PIT, LUST, ETC.)**	
Eielson AFB, LF003 Holding Cell #1	Eielson PFAS Plume	
CONTAMINANTS OF CONCERN	**ESTIMATED VOLUME**	**DATE(S) GENERATED**
PFAS	~17 tons	6/12/2024 - 6/25/2024
POST TREATMENT ANALYSIS REQUIRED *(such as GRO, DRO, RRO, VOCs, metals, PFAS, and/or Chlorinated Solvents)*		
The waste will be landfilled according to Roosevelt Regional Landfill's permit and it will not be tested after disposal.		
COMMENTS OR OTHER IMPORTANT INFORMATION		
The soil was generated during drilling activities for Eielson's Data Gap Investigation and Pilot Study Construction Project for treating PFAS contaminated groundwater near the northern border of the base. Waste characterization analyses, attached, included PFAS, TCLP VOCs , TCLP RCRA Metals, Ignitability, Corrosivity-pH, Reactivity Cyanide, and Reactivity Sulfide.		

TREATMENT FACILITY, LANDFILL, AND/OR FINAL DESTINATION OF MEDIA	PHYSICAL ADDRESS/PHONE NUMBER
Republic Services Roosevelt Landfill	500 Roosevelt Grade Rd, Roosevelt, WA 99358 / 206-391-1389

----------DEC USE ONLY----------

Based on the information provided, ADEC approves transport of the above mentioned material. The party conducting the cleanup or their consultant must submit to the DEC Project Manager a copy of weight receipts of the loads transported and a post treatment analytical report, if disposed of at an approved treatment facility. The contaminated soil shall be transported as a covered load in compliance with 18 AAC 60.015.

Instructions to Complete
Contaminated Media Transport and Treatment or Disposal Approval Form

The Alaska Department of Environmental Conservation (DEC) must approve the movement or disposal of contaminated soil and water from a site in accordance with 18 Alaska Administrative Code (AAC) 75.325(i), 18 AAC 75.370(b), and 18 AAC 78.274(b). The *Contaminated Media Transport and Treatment or Disposal Approval Form* should be used to document this approval. Soil treatment facilities regulated under 18 AAC 75.365 are required by their Operations Plans to only accept contaminated soil for which an approval form has been signed by a DEC project manager.

Site information can be found on the Contaminated Site Database (www.alaska.gov/Applications/SPAR/PublicMVC/CSP/Search/) or the Spills Database (http://dec.alaska.gov/Applications/SPAR/PublicMVC/PERP/SpillSearch).

Instructions to Complete:

1. **Hazard ID or Spill ID #:** For a contaminated site, the Hazard ID can be found on the Contaminated Sites Database. For a spill, the Spill ID can be found in the subject line of letters from DEC or the Spills Database. If the waste originates from multiple sites, all Hazard IDs or Spill IDs must be listed.

2. **Name of Contaminated Site or Spill:** For a contaminated site, the official site name can be found on the Contaminated Sites Database. For a spill, the official name of the spill is found in the subject line of letters from DEC or the Spills Database.

3. **Contaminated Site or Spill Location – Address or Other Appropriate Description:** This address or description captures the origin of the contaminated media or the location of the spill. For a contaminated site, the address or other appropriate description can be found on the Contaminated Sites Database. For a spill, this can be found on the Spill Report or the Spills Database.

4. **Current Physical Location of the Media:** Provide the physical location where the contaminated media (soil, water, etc.) is currently stored. This location may be the same as location provided in the "Contaminated Site or Spill Location", or it could be a hazardous waste facility or other location/staging area agreed upon in the DEC-approved work plan.

5. **Source of Contamination (Day Tank, Fire Training Pit, LUST, etc.):** List all sources which contributed to the contamination in the media being transported. Sources can include previous releases that have comingled. If the source is unknown, state "Unknown".

6. **Contaminants of Concern (CoCs):** List all contaminants detected above the most stringent Method 2 Tables B1 and B2 soil cleanup levels in 18 AAC 75.341(c) and (d), the Table C groundwater cleanup levels in 18 AAC 75.345, and other applicable action levels (e.g., TCLP results). Attach the laboratory data package for the contaminated media that is being disposed of and, if applicable, a data summary table or narrative to this form. Data gathered during site characterization activities may be sufficient to determine the CoCs. There are situations in which generator knowledge of the contaminant source may be accepted by a treatment or disposal facility in lieu of analytical sample results, such as, diesel-impacted media from a heating oil tank. If you are using generator knowledge in lieu of analytical sample results, include a statement which documents this knowledge in the Comments section.

7. **Estimated Volume:** Include the total volume of contaminated media to be transported; for instance, “Nine 55-gallon drums” or “”25 cubic yards of soil.”

8. **Date(s) Generated:** Provide the date the media was generated (e.g., excavated, pumped out of the ground, etc.). If the media was generated over multiple days, list the range of dates.

9. **Post Treatment Analysis Required (such as GRO, DRO, RRO, VOCs, PAHs, metals, PFAS, chlorinated solvents, etc.):** Provide the list of all contaminants that exceed the most stringent Method 2 cleanup levels. For DEC-approved soil treatment facilities in Alaska, specific post treatment analyses will be determined by the facility based upon the contaminants and requirements of their Operations Plan. If the media are being transported to a landfill or permitted liquid waste facility without off-site treatment, include “Not Applicable”.

10. **Comments or Other Important Information:** Provide any other information which needs to be conveyed.
    a. If generator knowledge of the CoCs is being used in lieu of sample analytical results, an explanation needs to be provided in this field.
    b. If the material is going to be placed in a landfill in Alaska, include a statement that the landfill has agreed to accept the material and provide the contact information for the landfill point of contact. If the material is going to be placed in a Class 2 or 3 landfill, attach the DEC Solid Waste Program’s approval letter to this form.
    c. If the media is going to an intermediate location or facility prior to its final destination, describe the complete transportation route with intermediate locations in this field.

11. **Treatment Facility, Landfill, and/or Final Destination of Media:** Include the name of the facility, landfill, or the final destination of the media. A list of DEC-approved Alaskan soil treatment facilities is available at www.dec.alaska.gov/spar/csp/offsite-remediation/. If multiple treatment facilities will be used, use separate forms to document what media will go to which facility. For material that will go to a waste transfer facility prior to disposal at another facility, the final destination should be listed.
    a. **Physical Address/Phone Number:** Provide the physical location and telephone number of the facility, landfill, or the final destination of the media.

12. **Party Conducting Cleanup:** Provide the name of the entity overseeing the project, typically this is the party responsible for the spill or could be a party which has received grant funding to conduct cleanup.
    a. **Address/Phone Number:** Provide the contact information for the party conducting the cleanup.

13. **Waste Management Company:** Provide the name of company or person shipping and/or organizing the shipment of the media.
    a. **Address/Phone Number:** Provide the mailing address and telephone number of the waste management company or organizer.

Submit this completed form along with all necessary attachments to the assigned DEC project manager for approval, or contact the Contaminated Sites Program at (907) 269-7558 or the Prevention, Preparedness and Response Program at (907) 269-7557.

Case Narrative
Arcadis U.S., Inc.
Lot Number: ZG18021

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.
Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-24 was followed for all PFAS samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-24 and our PFAS SOP. Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

For solid samples:
CF = DF * FV / Ws/S/1000
FV is volume of extract (mL)
Ws is initial sample weight (gram)
S is %Solids
DF is dilution factor. For undiluted analysis, DF = 1.

Concentration (ug/kg) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a DoD/DOE accredited laboratory; however, the following analyses are currently not listed on our DoD/DOE scope of accreditation: Drinking Water: pH EPA 150.1, Turbidity EPA 180.1, Metals EPA 200.7 & 200.8, Mercury EPA 245.1, Anions EPA 300.0, Cyanide EPA 335.4, Nitrates EPA 353.2, Orthophosphate & Phosphorus EPA 365.1, EDB/DBCP EPA 504.1, HPC SIMPLATE, Color SM 2120 B-2011, Alkalinity SM 2320 B-2011, Specific Conductance SM 2510 B-2011, Residue-filterable (TDS) SM 2540 C, Calcium Hardness (CaCO2) SM 3500-Ca B-2011, TRC SM 4500 Cl G-2011, pH SM 4500 H=B-2011, E.Coli, Total Coliform. Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18. Where applicable, all soil sample results (including LOQ and DL if requested) are corrected for dry weight unless flagged with a "W" qualifier.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Manual integration summaries are provided at the end of this report when applicable.

PFAS
The method blank associated with batch 16170 had PFOS detected at a concentration that was above the MDL but below ½ the PQL. All samples associated with this method blank that have detections for PFOS have been flagged with a "B".

DL = Detection Limit
LOD = Limit of Detection
U = Not detected at or above the LOD
J = Estimated result < LOQ and ≥ DL
* = RSD is out of criteria
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
+ = RPD is out of criteria

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

LOQ = Limit of Quantitation
DL = Detection Limit
LOD = Limit of Detection
U = Not detected at or above the LOD
J = Estimated result < LOQ and ≥ DL
* = RSD is out of criteria
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
+ = RPD is out of criteria

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Manual Integration Summary

Arcadis U.S., Inc.

Lot Number: ZG18021

Project Name: Eielson AFB

Project Number: 30167435.05

Where applicable, analytes for which manual integration occurred have been flagged with the following:

Qualifier	Technical Justification	Qualifier	Technical Justification	Qualifier	Technical Justification
M-01	Split peak	M-07	Low fit	M-13	Error
M-02	Peak tailing	M-08	Peak not found	M-14	Baseline
M-03	Incorrect auto integration	M-09	Analyte not Identified by the Data System	M-15	Other
M-04	Poor chromatography	M-10	Analyte misidentified by the Data System	M-16	Retention time shift
M-05	Manually assigned peak	M-11	Invalid integration	M-17	Shouldering
M-06	Wrong isomer	M-12	Wrong peak		

A summary of instances where manual integration occurred is included below:

Method	Sample	Run Number	Parameter	Qualifier
1633	ZG18021-001	1	Perfluorooctanesulfonic acid (PFOS)	M-03
1633	ZQ16170-102	1	Hexafluoropropylene oxide dimer acid	M-03
1633	ZQ16170-102	1	N-ethyl perfluorooctanesulfonamide	M-03
1633	ZQ16170-102	1	N-ethyl	M-03
1633	ZQ16170-002	1	N-methyl	M-03
1633	ZQ16170-102	1	N-methyl	M-03
1633	ZQ16170-102	1	Perfluoro-3-methoxypropanoic acid	M-03
1633	ZQ16170-102	1	Perfluoro-4-methoxybutanoic acid	M-03
1633	ZQ16170-102	1	Perfluorodecanesulfonic acid (PFDS)	M-03
1633	ZQ16170-102	1	Perfluorododecanoic acid (PFDoA)	M-03
1633	ZQ16170-001	1	Perfluorohexanesulfonic acid (PFHxS)	M-03
1633	ZQ16170-102	1	Perfluorononanoic acid (PFNA)	M-03
1633	ZQ16170-002	1	Perfluorooctanesulfonic acid (PFOS)	M-03
1633	ZQ16170-102	1	Perfluorooctanesulfonic acid (PFOS)	M-03
1633	ZQ16170-102	1	Perfluorooctanoic acid (PFOA)	M-03
1633	ZQ16170-102	1	Perfluoropentanoic acid (PFPeA)	M-03
1633	ZQ16170-102	1	3-Perfluoropropyl propanoic acid	M-03
1633	ZQ16170-102	1	Perfluoroundecanoic acid (PFUnA)	M-03
1633	ZQ16170-001	1	13C2-4:2FTS	M-03
1633	ZQ16789-002	1	13C2-6:2FTS	M-03

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris Ward
Project Manager

Project Narrative

All Reactive Cyanide results reported in the attached report were determined as totals using method 9012 B.
All Reactive Sulfide results reported in the attached report were determined as totals using method 9034-9030B.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

DL	Detection Limit.
LOD	Limit of Detection.
LOQ	Limit of Quantitation.
ND	Not detected at the Reporting Limit (or DL where applicable).
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
T8	Sample(s) received past/too close to holding time expiration.
U	Below Detectable Limits: Indicates that the analyte was not detected.

CERTIFICATE OF DESTRUCTION

I, Jeff Sichmeller, of Republic Services (RSI Facility), hereby certify that the entire product described in Section A has
been properly and legally disposed of in Roosevelt Regional MSW Landfill on 10/25/2024 (attach any appropriate documentation).

I understand that due to potential concerns related to such things as health, quality, and loss of goodwill, US Ecology-NRC Environmental does not want this product to be distributed to consumers, even through so called "distressed merchandise" channels of trade, and I further certify that these items were destroyed in such a manner that it cannot be sold, and that the company has taken every reasonable step to prevent resale of said items.

Name (print): Jeff Sichmeller

Waste Profile Number (if applicable): 41782413845 Job TB-13845

Description of Product	*Quantity or Weight*
Contaminated Soil	11.96/TN

ALASKA DEPARTMENT OF ENVIRONMENTAL CONSERVATION
DIVISION OF SPILL PREVENTION AND RESPONSE
Contaminated Sites and Prevention Preparedness and Response Programs

Contaminated Media Transport and Treatment or Disposal Approval Form

HAZARD ID # or SPILL ID #	NAME OF CONTAMINATED SITE OR SPILL	
26773 / 26997	Eielson AFB Basewide (AKA Sitewide) PFAS / Eielson AFB AFFF Area #4 Fire Training Area (FT009)	
CONTAMINATED SITE OR SPILL LOCATION – ADDRESS OR OTHER APPROPRIATE DESCRIPTION		
64.70116427370006, -147.1350420121095		
CURRENT PHYSICAL LOCATION OF MEDIA	**SOURCE OF THE CONTAMINATION (DAY TANK, FIRE TRAINING PIT, LUST, ETC.)**	
Eielson AFB, LF003 Holding Cell #1	Eielson PFAS Plume	
CONTAMINANTS OF CONCERN	**ESTIMATED VOLUME**	**DATE(S) GENERATED**
PFAS	two 55-gallon drums	8/14/2024 - 9/6/2024
POST TREATMENT ANALYSIS REQUIRED *(such as GRO, DRO, RRO, VOCs, metals, PFAS, and/or Chlorinated Solvents)*		
The waste will be landfilled according to the Grand View Facility permit and it will not be tested after disposal.		
COMMENTS OR OTHER IMPORTANT INFORMATION		
The passive flux meter (PFM) media consisted of GAC and resin beads. The PFM media was deployed in site monitoring wells and adsorbed PFAS and other dissolved contaminants from groundwater for flux assessment. The task was performed for Eielson's Data Gap Investigation and Pilot Study Construction Project for treating PFAS contaminated groundwater near the northern border of the base. Waste characterization analyses, attached, included PFAS, TCLP VOCs , TCLP RCRA Metals, Ignitability, Corrosivity-pH, Reactivity Cyanide, and Reactivity Sulfide.

----------DEC USE ONLY----------

Based on the information provided, ADEC approves transport of the above mentioned material. The party conducting the cleanup or their consultant must submit to the DEC Project Manager a copy of weight receipts of the loads transported and a post treatment analytical report, if disposed of at an approved treatment facility. The contaminated soil shall be transported as a covered load in compliance with 18 AAC 60.015.

Instructions to Complete
Contaminated Media Transport and Treatment or Disposal Approval Form

The Alaska Department of Environmental Conservation (DEC) must approve the movement or disposal of contaminated soil and water from a site in accordance with 18 Alaska Administrative Code (AAC) 75.325(i), 18 AAC 75.370(b), and 18 AAC 78.274(b). The *Contaminated Media Transport and Treatment or Disposal Approval Form* should be used to document this approval. Soil treatment facilities regulated under 18 AAC 75.365 are required by their Operations Plans to only accept contaminated soil for which an approval form has been signed by a DEC project manager.

Site information can be found on the Contaminated Site Database (www.alaska.gov/Applications/SPAR/PublicMVC/CSP/Search/) or the Spills Database (http://dec.alaska.gov/Applications/SPAR/PublicMVC/PERP/SpillSearch).

Instructions to Complete:

1. **Hazard ID or Spill ID #:** For a contaminated site, the Hazard ID can be found on the Contaminated Sites Database. For a spill, the Spill ID can be found in the subject line of letters from DEC or the Spills Database. If the waste originates from multiple sites, all Hazard IDs or Spill IDs must be listed.

2. **Name of Contaminated Site or Spill:** For a contaminated site, the official site name can be found on the Contaminated Sites Database. For a spill, the official name of the spill is found in the subject line of letters from DEC or the Spills Database.

3. **Contaminated Site or Spill Location – Address or Other Appropriate Description:** This address or description captures the origin of the contaminated media or the location of the spill. For a contaminated site, the address or other appropriate description can be found on the Contaminated Sites Database. For a spill, this can be found on the Spill Report or the Spills Database.

4. **Current Physical Location of the Media:** Provide the physical location where the contaminated media (soil, water, etc.) is currently stored. This location may be the same as location provided in the "Contaminated Site or Spill Location", or it could be a hazardous waste facility or other location/staging area agreed upon in the DEC-approved work plan.

5. **Source of Contamination (Day Tank, Fire Training Pit, LUST, etc.):** List all sources which contributed to the contamination in the media being transported. Sources can include previous releases that have comingled. If the source is unknown, state "Unknown".

6. **Contaminants of Concern (CoCs):** List all contaminants detected above the most stringent Method 2 Tables B1 and B2 soil cleanup levels in 18 AAC 75.341(c) and (d), the Table C groundwater cleanup levels in 18 AAC 75.345, and other applicable action levels (e.g., TCLP results). Attach the laboratory data package for the contaminated media that is being disposed of and, if applicable, a data summary table or narrative to this form. Data gathered during site characterization activities may be sufficient to determine the CoCs. There are situations in which generator knowledge of the contaminant source may be accepted by a treatment or disposal facility in lieu of analytical sample results, such as, diesel-impacted media from a heating oil tank. If you are using generator knowledge in lieu of analytical sample results, include a statement which documents this knowledge in the Comments section.

7. **Estimated Volume:** Include the total volume of contaminated media to be transported; for instance, “Nine 55-gallon drums” or “”25 cubic yards of soil.”

8. **Date(s) Generated:** Provide the date the media was generated (e.g., excavated, pumped out of the ground, etc.). If the media was generated over multiple days, list the range of dates.

9. **Post Treatment Analysis Required (such as GRO, DRO, RRO, VOCs, PAHs, metals, PFAS, chlorinated solvents, etc.):** Provide the list of all contaminants that exceed the most stringent Method 2 cleanup levels. For DEC-approved soil treatment facilities in Alaska, specific post treatment analyses will be determined by the facility based upon the contaminants and requirements of their Operations Plan. If the media are being transported to a landfill or permitted liquid waste facility without off-site treatment, include “Not Applicable”.

10. **Comments or Other Important Information:** Provide any other information which needs to be conveyed.
    a. If generator knowledge of the CoCs is being used in lieu of sample analytical results, an explanation needs to be provided in this field.
    b. If the material is going to be placed in a landfill in Alaska, include a statement that the landfill has agreed to accept the material and provide the contact information for the landfill point of contact. If the material is going to be placed in a Class 2 or 3 landfill, attach the DEC Solid Waste Program’s approval letter to this form.
    c. If the media is going to an intermediate location or facility prior to its final destination, describe the complete transportation route with intermediate locations in this field.

11. **Treatment Facility, Landfill, and/or Final Destination of Media:** Include the name of the facility, landfill, or the final destination of the media. A list of DEC-approved Alaskan soil treatment facilities is available at www.dec.alaska.gov/spar/csp/offsite-remediation/. If multiple treatment facilities will be used, use separate forms to document what media will go to which facility. For material that will go to a waste transfer facility prior to disposal at another facility, the final destination should be listed.
    a. **Physical Address/Phone Number:** Provide the physical location and telephone number of the facility, landfill, or the final destination of the media.

12. **Party Conducting Cleanup:** Provide the name of the entity overseeing the project, typically this is the party responsible for the spill or could be a party which has received grant funding to conduct cleanup.
    a. **Address/Phone Number:** Provide the contact information for the party conducting the cleanup.

13. **Waste Management Company:** Provide the name of company or person shipping and/or organizing the shipment of the media.
    a. **Address/Phone Number:** Provide the mailing address and telephone number of the waste management company or organizer.

Submit this completed form along with all necessary attachments to the assigned DEC project manager for approval, or contact the Contaminated Sites Program at (907) 269-7558 or the Prevention, Preparedness and Response Program at (907) 269-7557.

Case Narrative
Arcadis U.S., Inc.
Lot Number: ZI12018

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.
Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-24 was followed for all PFAS samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-24 and our PFAS SOP. Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

For solid samples:
CF = DF * FV / Ws/S/1000
FV is volume of extract (mL)
Ws is initial sample weight (gram)
S is %Solids
DF is dilution factor. For undiluted analysis, DF = 1.

Concentration (ug/kg) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a DoD/DOE accredited laboratory; however, the following analyses are currently not listed on our DoD/DOE scope of accreditation: Drinking Water: pH EPA 150.1, Turbidity EPA 180.1, Metals EPA 200.7 & 200.8, Mercury EPA 245.1, Anions EPA 300.0, Cyanide EPA 335.4, Nitrates EPA 353.2, Orthophosphate & Phosphorus EPA 365.1, EDB/DBCP EPA 504.1, HPC SIMPLATE, Color SM 2120 B-2011, Alkalinity SM 2320 B-2011, Specific Conductance SM 2510 B-2011, Residue-filterable (TDS) SM 2540 C, Calcium Hardness (CaCO2) SM 3500-Ca B-2011, TRC SM 4500 Cl G-2011, pH SM 4500 H=B-2011, E.Coli, Total Coliform. Solid and Chemical Materials: Boron & Titanium SW-846 6010D, Molybdenum SW-846 6020B, Ethylene Glycol SW-846 8015B, Pentachlorophenol SW-846 8151A, Chloroprene SW-846 8260B, SVOC 1,4-Dioxane, 1,3,5-Trinitrobenzene, 1,4- Naphthoquinone, 1,4-Phenylenediamine, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 3-Methylcholanthrene, 4-Aminobiphenyl, 4-Dimethyl aminoazobenzene, 4-Nitroquinoline-1-oxide, 7,12-Dimethylbenzo(a)anthracene, Chlorobenzilate, Diallate, Ethyl methanesulfonate, Isodrin, Isosafrole, Methyl methanesulfonate, n-Nitrosomethylethylamine, n-Nitrosomorpholine, n-Nitrosopiperidine, Piperonyl butoxide, Pronamide, Safrole, 3,5- Dinitroaniline, PETN SW-846 8270E, Oil & Grease SW-846 9071B.

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18. Where applicable, all soil sample results (including LOQ and DL if requested) are corrected for dry weight unless flagged with a "W" qualifier.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Manual integration summaries are provided at the end of this report when applicable.

PFAS
The method blank associated with batch 18915 had PFOSA detected at a concentration that was above the MDL but below the PQL. All samples associated with this method blank that have detections for PFOSA have been flagged with a "B".

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
Q = Surrogate failure
U = Not detected at or above the LOD
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
L = LCS/LCSD failure
H = Out of holding time
W = Reported on wet weight basis
LOD = Limit of Detection
S = MS/MSD failure

Manual Integration Summary

Arcadis U.S., Inc.

Lot Number: ZI12018

Project Name: Eielson AFB

Project Number: 30167435.05

Where applicable, analytes for which manual integration occurred have been flagged with the following:

Qualifier	Technical Justification	Qualifier	Technical Justification	Qualifier	Technical Justification
M-01	Split peak	M-07	Low fit	M-13	Error
M-02	Peak tailing	M-08	Peak not found	M-14	Baseline
M-03	Incorrect auto integration	M-09	Analyte not Identified by the Data System	M-15	Other
M-04	Poor chromatography	M-10	Analyte misidentified by the Data System	M-16	Retention time shift
M-05	Manually assigned peak	M-11	Invalid integration	M-17	Shouldering
M-06	Wrong isomer	M-12	Wrong peak		

A summary of instances where manual integration occurred is included below:

Method	Sample	Run Number	Parameter	Qualifier
1633	ZI12018-001	1	1H,1H,2H,2H-Perfluorodecane sulfonic	M-03

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris Ward
Project Manager

Project Narrative

All Reactive Cyanide results reported in the attached report were determined as totals using method 9012 B.

All Reactive Sulfide results reported in the attached report were determined as totals using method 9034-9030B.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

DL	Detection Limit.
LOD	Limit of Detection.
LOQ	Limit of Quantitation.
ND	Not detected at the Reporting Limit (or DL where applicable).
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C4	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
T8	Sample(s) received past/too close to holding time expiration.
U	Below Detectable Limits: Indicates that the analyte was not detected.

Re: Permit Authorization: AKG003059 v1.0 - Eielson AFB PFAS Wastewater Treatment

The Alaska Department of Environmental Conservation (DEC) has completed its review of your AKG003000 Hydrostatic and Aquifer Pump Testing Notice of Intent (NOI) for the *Eielson AFB PFAS Wastewater Treatment* and is issuing the authorization number **AKG003059** for this project. The discharge from this project is authorized in accordance with the terms of the general permit and any site-specific requirements in this authorization. An electronic copy of the Hydrostatic and Aquifer Pump Testing general permit is available at http://dec.alaska.gov/water/wastewater/stormwater/dewater-hydrostatic/#hydrostatic.

Effective date is 09/08/2023.

Project Description: Operate an ion exchange resin-based wastewater treatment system to treat wastewater containing per- and polyfluoroalkyl substances (PFAS) at Eielson Air Force Base

Project Location: Hazardous Waste Facility, Flight Line Avenue, Eielson Air Force Base, AK 99702; Lat/Long: 64.652666, -147.07863

Discharge Location: Is the discharge solely to land: Yes

Estimated Project Dates: 9/5/2023 – 10/31/2025

The authorization to discharge expires upon submittal of a Notice of Termination, see Permit Part 7.

The authorized discharge location is to land as described in the NOI.

Note, as per Permit Part 2.5 the permittee is required to submit a modification NOI within 30 calendar days if any of the following change: Owner/Operator address and contact information, site information, estimated start or end dates.

The permittee is reminded of the following permit requirements:

- Compliance with Standards and Limits, see Permit Part 3.1 Requirements for all Projects.
- Control Measures, see Permit Parts 4.0 and 4.1 – Erosion and Sediment Control Measures.
- Limitations, Inspections, and Monitoring Requirements, see Permit Part 5.1 Land Disposal Discharges of Hydrostatic Testing, see Permit Part 5.2 Surface Water Discharges of Hydrostatic Testing, see Permit Part 5.3 Land Disposal Discharges of Aquifer Pump Testing,
- Reporting and Recordkeeping, see Permit Part 6.

Alaska DEC Watermark
AKG003059 v1.0
Approved
Issued On:09/08/2023
Expires On:09/30/2024

- Submitting a Notice of Termination (NOT), see Permit Part 7.
  Note: within 30 days upon completion of the dewatering activity you are required to submit a NOT to the DEC Permitting Program to terminate coverage. Include the Discharge Monitoring Report (DMR, https://dec.alaska.gov/media/16894/akg003000-dmr.pdf) with your submission of the NOT. The complete and accurate NOT and DMR is to be submitted electronically using the Environmental Data Management System (EDMS) which can be accessed at https://dec.alaska.gov/Applications/Water/EDMS/ncore/external/home.

A copy of the General Permit AKG003000 and this authorization must be kept at the project site. This authorization does not relieve the permittee from other local, state, or federal government permitting requirements.

If you have general questions regarding the storm water program or your responsibilities under the Hydrostatic and Aquifer Pump Testing general permit, please contact Sam Kito, sam.kito@alaska.gov (907) 269-7542.

Sincerely,

James Rypkema
Program Manager, Storm Water and Wetlands

OPERATOR PLAN AUTHORIZATION/CERTIFICATION/DELEGATION

(To be signed by Responsible Corporate Officer)

I state that based on my review this Best Management Practices (BMP) Plan meets the minimum requirements of the 2014 Alaska General Permit for Hydrostatic and Aquifer Pump Testing (AKG003000) and that Ahtna Solutions, LLC (Ahtna) has day-to-day operational control of the project site. Ahtna is responsible for the maintenance and implementation of the plan including inspections, documentation, and implementation at the site. Ahtna will notify all subcontractors of the requirement of this BMP Plan. Ahtna has operational control over the project specifications, including the ability to make changes to the project specifications.

I hereby designate Andrew Weller, PE as my authorized representative. This designee is responsible for the overall operations of the site and will be responsible for the implementation of the BMP Plan, compliance with the General Permit, selecting and implementing additional control measures as conditions warrant, and signing all inspection reports required.

I certify under penalty of law that this document and all attachments were prepared under direction of Ahtna in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

2.2 Project Description

Eielson Air Force Base (AFB) has several sources of wastewater impacted by per-and polyfluoroalkyl substances (PFAS) that include perfluorooctane sulfonate, aka perfluorooctane sulfonic acid (PFOS), with Chemical Abstract System (CAS) # 1763-23-1, perfluorooctanoic acid (PFOA) with CAS # 335-67-1, GenX Chemicals (HFPO-DA) with CAS # 13252-13-6, and perfluorobutane sulfonic acid (PFBS) with CAS # 375-73-5. These sources include groundwater produced as investigation-derived waste (IDW), water from fire suppression systems, and groundwater that has entered basements during periods of high groundwater.

Ahtna Solutions, LLC (Ahtna) will operate the PFAS wastewater treatment system during summers of 2023, 2024, and 2025 on behalf of the US Air Force to treat potential wastewater listed in the previous paragraph. This wastewater treatment system consists of three 10,000-gallon uninsulated influent holding tanks, a pretreatment system, a treatment system, and a 14,000-gallon uninsulated effluent holding tank. The pretreatment system was fabricated by Lifewater Engineering and consists of an oil/water separator, an ozone generator and injector to disinfect and precipitate dissolved metals, a 3-cubic foot vessel containing adsorbent cellulose, a 3-cubic foot vessel containing filter sand, a 3-cubic ft vessel containing organoclay, and a 3-cubic foot vessel containing granulated activated carbon (GAC). The treatment system was designed by ECT2 and contains a bag filter, two 4.5-cubic foot vessels containing GAC, two 5-cubic foot vessels containing PT1 ion exchange resin primarily for metals removal, four cartridge filters, two 3-cubic foot vessels containing A3F ion exchange resin, and two 3-cubic foot vessels containing LC1 ion exchange polishing resin. Flow diagrams of the pretreatment and treatment modules are attached to this BMP Plan. The treatment system is designed so that spent ion exchange resin is exchanged with fresh resin, rather than regenerated onsite.

Various entities have operated the PFAS wastewater treatment system from summers of 2018 through 2022 for treating wastewaters described in the first paragraph. Treatability studies occurred during the first three summers of operation where detailed sampling occurred following each treatment stage to document the efficacy of the system in removing PFAS and other contaminants from wastewater. Details on the treatability studies and system

operating parameters can be found in the *Treatability Study Report, PFAS Impacted Wastewater, Eielson Air Force Base, Alaska* (US Air Force [USAF], 2019a), *Operations and Maintenance Manual, PFAS Wastewater Treatment System, Eielson Air Force Base, Alaska* (USAF, 2019b), and the *Treatability Study Report, PFAS-Impacted Wastewater Treatability Study Extension, Eielson Air Force Base, Alaska* (USAF, 2021).

The PFAS wastewater treatment system has proven its efficacy in treating various wastewaters to single digit parts per trillion (ppt) PFOS, PFOA, GenX Chemicals, and PFBS in the effluent (USAF, 2021). In 2021, influent concentrations of PFOS plus PFOA sums averaged 425 parts per billion (ppb), and total PFAS influent concentrations averaged 637 ppb. The highest influent concentrations were seen in a 1,700-gallon batch of fire suppression solutions with 1.2 parts per million (ppm) PFOS plus PFOA and 1.5 ppm total PFAS. Effluent concentrations in that batch were 2.82 ppt PFOS plus PFOA and 24.77 ppt total PFAS.

Breakthrough has not been observed in the PFAS wastewater treatment system effluent. There was not enough PFAS mass treated during the treatability studies to observe breakthrough. The system's capacity was too great. During the treatability study extension performed during summers of 2020 and 2021, a total of 19,493 milligrams (mg) PFOS plus PFOA and 30,117 mg PFAS were removed without replacing media. The removal occurred throughout the pretreatment and treatment systems. The removed amounts were obtained while bypassing the two GAC vessels in the treatment system during approximately half the study, in an attempt to observe breakthrough (USAF, 2021) It is unknown what the full removal capacity is for the PFAS wastewater treatment system, but it is greater than the amounts shown in this paragraph.

A pilot study was published in 2017 that determined the mg of PFAS removed per gram of A3F ion exchange resin. The A3F ion exchange resin is used as the middle ion exchange resin stage in the treatment system. The pilot study is cited as Woodard, S., Berry, J., & Newman, B., 2017. Ion exchange resin for PFAS removal and pilot test comparison to GAC. *Remediation.* https://doi.org/10.1002/rem.21515. The study determined the A3F resin removed 1.66 mg PFAS/gram A3F resin at an empty bed contact time (EBCT) of 5 minutes using an average of 94 ppb PFAS wastewater before breakthrough above the 2016 USEPA Lifetime Health Advisory (LHA) of 70 ppt PFOS plus PFOA. Applying the 1.66 mg PFAS/gram A3F resin to the Eielson AFB PFAS wastewater treatment system, where the Eielson AFB PFAS wastewater treatment system contains 6 cubic foot A3F resin with a specific gravity of 1.1, and a 5-minute EBCT for both A3F vessels combined, the treatment system could theoretically remove 310,241 mg PFAS prior to breakthrough above the 2016 LHA. The pilot study did not report the A3F resin's capacity for solely PFOS plus PFOA.

Operating conditions were different between Ahtna's treatability study and the referenced pilot study. The ion exchange resin's PFAS removal capacity is affected by variables including temperature, EBCT, definition of breakthrough, suite of PFAS included in laboratory analyses, co-contaminants, water quality parameters, etc. Therefore, a conservative value needs to be chosen for the PFAS removal capacity of the Eielson PFAS wastewater treatment system before breakthrough above the 2016 LHA is expected.

Ahtna will treat wastewater containing 50,000 mg of PFAS using the Eielson PFAS wastewater treatment system in accordance with the Operations and Maintenance Manual (USAF, 2019b) while discharging effluent to land. Ahtna and the US Air Force will verify PFAS influent concentrations and track the treated volume. After the 50,000 mg of PFAS threshold is reached, Ahtna will then sample each effluent batch prior to discharge for PFOA, PFOS, GenX Chemicals, and PFBS. Effluent results will be compared to current, final PFAS LHAs: the 2016 LHA of 70 ppt for the sum of PFOS and PFOA, the 2022 LHA of 10 ppt for GenX Chemicals, and the 2022 LHA of 2,000 ppt for PFBS and recorded on the attached effluent monitoring log. If effluent sample results exceed any of the LHA criteria, Ahtna will retreat and resample until sample results are below the LHA criteria prior to discharge. This strategy will allow treatment immediately before fall freeze-up. Turnaround times for PFAS results average four to six weeks, and it is unreasonable to store treated effluent in uninsulated tanks during freezing conditions while waiting for sample results.

50,000 mg of PFAS is an appropriate, conservative mass for the following reasons. 1) The 2020 and 2021 treatability study extension removed 30,117 mg PFAS with no breakthrough of PFOS and PFOA, even while bypassing 6 cubic ft of GAC within the treatment system for approximately half of the study. 2) The 6 cubic ft of A3F in the treatment system could theoretically remove 310,241 mg PFAS prior to breakthrough of PFOS plus PFOA above the 2016 LHA. The pretreatment and treatment systems also contain 3 cubic ft each of cellulose and organoclay, 9 cubic ft of GAC, 10 cubic ft of PT1 resin, and 6 cubic ft of LC1 resin. The 9 cubic ft of GAC has a removal capacity of 15,505 mg PFAS, based on a 2015 isotherm analysis performed by Calgon Carbon Corporation with a max PFAS loading rate of 0.117/gram F-400 GAC. That analysis is cited as *Isotherm: Removal of TOC and PFCs from Drinking Water using F-400 GAC.* Technical Service Report No. 20150420, prepared for Hoosick Falls, NY by Calgon Carbon Corporation. PFAS capacity for the other treatment media in the pretreatment and treatment systems have not been determined. 3) Discharge will be to land only. Operators will continuously monitor the northeast culvert of the northeast swale, seen in the attached figure, to ensure effluent infiltrates the ground surface prior to that monitoring location. Discharge will immediately cease if effluent reaches the culvert entrance.

2.3 Dewatering Plan (Methods, Equipment, Timing, Etc.)

Dewatering may occur in Eielson AFB houses. Groundwater containing PFAS infiltrates basements during some high groundwater periods. Groundwater removed from home basements may be brought to the PFAS treatment system for treatment.

3 DISCHARGE INFORMATION

3.1 Location of Discharge

Water would discharge to	☐ Water	☑ Land
Do you have excavation dewatering activities located within 1,500 feet of any DEC identified contaminated sites either in "Active" or "Cleanup Complete-Institutional Controls"?	☑ Yes	☐ No
Do you have excavation dewatering activities located within 1,500 feet of a DEC identified "contaminated groundwater plume" with discharges to land or waters of the U.S. or waters of the state?	☑ Yes	☐ No

3.2 Pollutants of Concern

PFOS, PFOA, GenX Chemicals, PFBS, and potentially trace hydrocarbons.

3.3 Receiving Water Bodies

Not applicable. Discharge is to land.

3.4 Discharge Flow Rates

Maximum anticipated discharge flow rate:	2400	gallons per day
Average anticipated discharge flow rate:	2100	gallons per day
Total anticipated discharge:	90,000 (30,000 gal/yr for 3 yrs at 5 gpm)	gallons
Discharge velocity at the end of pipe:	0.51 (5 gpm through 2" hose)	feet per second

3.5 Land Disposal Site Conditions, if applicable

Soil Type(s) and Slopes (describe soil type(s) and current slopes; note any changes due to grading or fill activities): Surface soil at the site and in the drainage swale consist of alluvial gravel, sand, and silt with a covering of vegetation.

Landscape Topography: Flat topography within the main Eielson AFB area.

Drainage patterns (describe current drainage patterns and note any changes due to grading or fill activities): Stormwater at this location drains to the northeast towards Garrison Slough through a 12-inch culvert located at the northeast end of the northeast swale adjacent to the treatment facility. Effluent discharge will not occur if there is potential for effluent to flow into Garrison Slough. Discharge will be to land only.

Depth to groundwater: 7 to 12 feet below ground surface, based on seasonal variation and ground elevation variation.

Type of Existing Vegetation: Grasses

4 BEST MANAGEMENT PRACTICES AND DETAILED SITE MAP

4.1 Best Management Practices (BMP)

BMP1: Operating staff will continuously monitor effluent discharge to ensure infiltration into the ground surface prior to reaching waters of the US. Discharge will only occur when there is no pre-existing standing water in the adjacent swales that would cause flow into the farthest northeast culvert. Discharge will immediately cease if discharged water has the potential to reach waters of the US. Effluent will be discharged into the swale closest to the treatment system, the southwest swale. That swale is connected to another swale, the northeast swale, via an approximately 50-ft long culvert. Both swales are approximately 5-ft deep and 16-ft wide. One swale is 115-ft long and the other is 16-ft long. The total capacity of both swales is approximately 82,000 gallons.

BMP2: A discharge reinforcement lining will be placed beneath the effluent discharge outlet pipe to prevent scour erosion.

BMP3: A check dam constructed of sandbags will be placed across the drainage swale on either side of the effluent discharge outlet to reduce water velocity within the drainage swales.

BMP4: Caps will be placed over culverts, if necessary to prevent effluent from entering culverts. One cap will be placed over the culvert at the northeast end of the northeast swale, and one cap will be placed over culvert at the southwest end of the southwest swale. Caps will be sealed with bentonite, hydrated to the consistency of putty. Caps and seals will be removed following each discharge.

BMP5: Treatment system operators will complete a Wastewater Profile, attached to this BMP Plan, for each type of wastewater to ensure treatment is in accordance with regulations and to monitor the mass of influent PFAS. Operators will sum and record the cumulative mass of influent PFAS so they can begin sampling effluent for PFOS, PFOA, GenX Chemicals, and PFBS after 50,000 mg PFAS has been treated. Operators will then store the effluent onsite and discharge it after confirming criteria shown in the Effluent Monitoring Log have been met.

4.2 Treatment Methodology

How will the contaminate be mitigated should it become entrained during the Excavation dewatering process?

The Eielson AFB PFAS wastewater treatment system will be operated in accordance with the Operations and Maintenance Manual (USAF, 2019b).

5 MONITORING

5.1 EFFLUENT MONITORING

5.1.1 Upland Discharge

Table 5-1: Effluent Monitoring Requirements for Upland Discharges

Effluent Parameter	Monitoring Location	Monitoring Frequency	Sample Type
Erosion	Point of Discharge	Daily	Visual
Sheen*	Effluent	Daily	Visual
Flow Rate	Effluent	Daily	24-hour Estimate or Measured
Discharge Only to Land	Northeast Culvert of Northeast Swale (ensure effluent infiltrates ground surface prior to this monitoring location)	Continuous	Visual
*Discharge shall be free of any visible sheen.			
Following treatment of 50,000 mg PFAS, effluent will be sampled for PFOS, PFOA, GenX Chemicals, and PFBS using USEPA Method 1633 and compared to criteria shown on the Effluent Monitoring Log in Appendix A prior to discharge to land.			

5.1.2 Water Discharge

Not applicable. Discharge is to land.

5.1.3 Special Monitoring Requirements

Treatment system operators will complete a Wastewater Profile, attached to this BMP Plan, for each type of wastewater to ensure treatment is in accordance with regulations and to monitor the mass of influent PFAS. Operators will sum and record the cumulative mass of influent PFAS.

6 REPORTING AND RECORDKEEPING

6.1 Recordkeeping

Ahtna will maintain laboratory sample results, field measurements, calibration and maintenance records, field logbooks, sample chains of custody, waste profiles, photographs, monitoring logs, and a copy of the Hydrostatic and Aquifer Pump Test General Permit for at least three years following treatment activities.

Records of monitoring information will include field measurements and laboratory analyses. Records will include dates, locations, times, names of people performing analyses or measurements, methods used, and results.

6.2 Reporting

Discharges will be to land, therefore; USEPA Discharge Monitoring Report forms, revised as of March 1999, will not be completed.

Ahtna will prepare annual Eielson AFB PFAS wastewater treatment system reports for the US Air Force and will provide copies to the Alaska DEC. Each report will cover treatment system operations from approximately May to September of 2023, 2024, and 2025.

Annual reports will be provided to:

State of Alaska Department of Environmental Conservation
Division of Water
Wastewater Discharge Authorization Program
555 Cordova Street Anchorage, Alaska 99501
Telephone (907) 269-6285
Fax (907) 269-3487
Email: DEC.Water.WQPermit@alaska.gov
and
State of Alaska Department of Environmental Conservation
Division of Spill Prevention and Response
Contaminated Sites Program
610 University Avenue
Fairbanks, Alaska 99709
Telephone (907) 451-2143
Fax (907) 269-7687

Any changes to the operation of the Eielson AFB PFAS wastewater treatment system, as described in Section 2.0 Special Reporting Obligations of the Hydrostatic and Aquifer Pump Test General Permit, will be communicated to the Department, as specified in that permit section.

Any documents relating to compliance are to be sent to the following address:

State of Alaska Department of Environmental Conservation
Division of Water
Compliance and Enforcement Program
555 Cordova Street Anchorage, Alaska 99501
Telephone Nationwide (877) 569-4114
Anchorage Area / International (907) 269-4114
Fax (907) 269-4604
Email: dec-wqreporting@alaska.gov

If it is necessary to submit a noncompliance notification to the Department, use this form https://dec.alaska.gov/water/compliance/permittee/

Operators shall report any noncompliance event that may endanger health, or the environment as follows:
3.4.1 A report must be made:

3.4.1.1 Orally within 24 hours after the permittee becomes aware of the circumstances, and
3.4.1.2 In writing within five days after the permittee becomes aware of the circumstances. The e-mail address to report noncompliance is: dec-wqreporting@alaska.gov.

Appendix A: Effluent Monitoring Log (Blue shaded parameters will be monitored after Treatment of 50,000 mg PFAS using the same media.)

DATE: _____ CUMULATIVE PFAS REMOVED WITH SAME MEDIA (mg) _____

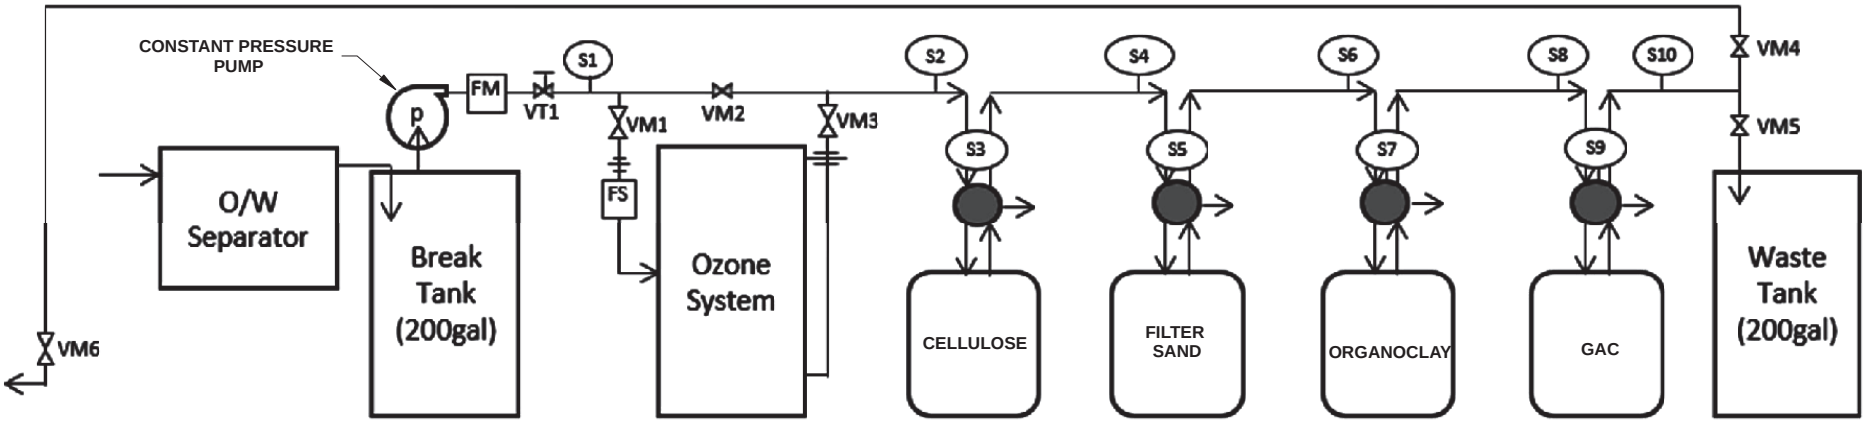
NAME or OBSERVER: _____

OBSERVATIONS: _____(cont'd on reverse)

Date:	Initials	PARAMETER	METHOD	Sample Type	Monitoring/Sample Location	LIMIT	Result (if applicable, ppt)	PASS/FAIL*	Frequency
		Erosion	Visual	NA	Point of Discharge	No Erosion	NA		Daily
		Sheen	Visual	NA	Effluent	No Sheen	NA		Daily
		Flow Rate	24-hour Estimate or Measured	NA	Effluent	NA		NA	Daily
		Discharge to Land Only	Visual	NA	Northeast Culvert of Northeast Swale	Ensure Effluent Infiltrates Ground Surface Prior to this Monitoring Location	NA		Continuous
		PFOS CAS # 1763-23-1	USEPA Method 1633	Grab	X4 (after 2nd LC1 resin vessel)	Sum of 70 ppt (Final 2016 LHA)			Prior to Discharge
		PFOA CAS # 335-67-1	USEPA Method 1633	Grab	X4 (after 2nd LC1 resin vessel)				
		GenX Chemicals CAS # 13252-143-6	USEPA Method 1633	Grab	X4 (after 2nd LC1 resin vessel)	10 ppt (Final 2022 LHA)			Prior to Discharge
		PFBS CAS # 375-73-5	USEPA Method 1633	Grab	X4 (after 2nd LC1 resin vessel)	2,000 ppt (Final 2022 LHA)			Prior to Discharge

* If effluent fails any parameter, discharge may not proceed, and corrective action and system revalidation must take place. The effluent will be retreated and resampled until all parameters are passed. The blue shaded parameters will be monitored after 50,000 mg PFAS have been treated with same media.

Observations (cont'd from reverse):



Key

- PG — Pressure gauge
- FM — Flow meter
- S — Sample port/air bleed/pressure gauge
- Flow throttling valve
- FS — Flow activated switch (built into ozone system)
- Manual valve (VM)
- Multi-port filter valve (MPV)

Data Quality Assessment

This letter summarizes the findings of a data quality assessment (DQA) conducted by Arctic Data Services, LLC (ADS) for the above-referenced project data on behalf of Arcadis U.S., Inc. Precision, accuracy, sensitivity, representativeness, comparability, and completeness of the data was evaluated by reviewing laboratory-supplied quality assurance/quality control (QA/QC) information as well as conducting independent QA/QC checks on the data. A Stage 2B data validation was performed on 100% of project sample data relating to analysis of per- and polyfluoroalkyl substances (PFAS) in general accordance with the Department of Defense (DoD) *General Data Validation Guidelines* (2019), the DoD *Data Validation Guidelines Module 6: Data Validation Procedures for Per- and Polyfluoroalkyl Substances Analysis by QSM Table B-24* (2022), and the *Uniform Federal Policy – Quality Assurance Project Plan, Data Gap Investigation & Groundwater Pilot Study Construction in Support of the Groundwater Response Action for PFAS Treatment at Site FT009P* (Ahtna Solutions-Arcadis 8(a) Joint Venture, LLC, 2024). Stage 2B validation includes reviewing sample handling, custody, sample-batch level QC information, and instrument-level QC data; applying data qualifiers to sample results affected by anomalies and QC failures; and summarizing the impacts to data quality. This validation meets the requirements of the Alaska Department of Environmental Conservation (ADEC) *Technical Memorandum 22-001, Guidelines for Data Reporting* (August 2022). Additionally, Stage 4 data validation was performed on 10% of the project sample data relating to analysis of PFAS as described in the Stage 4 Validation section below; Stage 4 data validation includes Stage 3 recalculation of field and QC sample results.

Laboratory QC-sample recoveries and relative percent differences (RPDs) were compared to measurement quality objectives (MQOs) specified in the UFP-QAPP, EPA Draft Method 1633, and/or laboratory control limits. Field-duplicate RPDs were compared to MQOs defined in Worksheet #12 of the UFP-QAPP for the applicable matrix. Limits of quantitation (LOQs) and limits of detection (LODs) were compared to project screening levels (PSLs) listed in Worksheet #15 of the 2024 UFP-QAPP to evaluate analytical sensitivity.

ADEC laboratory data review checklists (attached) were completed for each laboratory work order and summarize Stage 2A data validation findings. Separate checklists were prepared summarizing Stage 2B data validation findings and are also attached. Table 1 (attached) provides a list of qualified results. Table 2 lists the samples that were randomly selected for Stage 3/4 validation. Tables 3 through 5 summarize results recalculated in the course of Stage 3 data validation. The following sections provide a summary of data validation findings for each QA/QC element reviewed; failures or anomalies that had no impact to data quality are discussed in the checklists and are not further described herein.

Sample Analysis Summary

A total of 35 soil samples (including field duplicates) were collected and submitted in two sample delivery groups (SDGs) to Pace Columbia for analysis of the following:

- Per- and polyfluoroalkyl substances (PFAS) by EPA Draft Method 1633

Stage 2A Data Validation

The following sections summarize the findings of Stage 2A data validation, which includes review of preparatory-batch-level QC information. Only failures affecting project-sample data quality are discussed here; for more information, refer to the attached ADEC laboratory data review checklists.

Sample Preservation, Handling, Custody, and Holding Times

Sample receipt forms were reviewed to check that samples were received in good condition, properly preserved, and within the required temperature range. Chain of custody forms were reviewed to confirm that custody was not breached during sample handling. Dates of sample collection, preparation, and analysis were compared to check that method holding times were not exceeded.

There were no handling, custody, or holding time failures determined to affect project-sample data quality; see checklists for details.

Method Blanks

The laboratories analyzed and reported a method blank (MB) sample for each preparatory batch, to check for laboratory-based sample contamination. If and where analytes were detected in an MB, corresponding project-sample results were compared to the MB concentration and were considered potentially affected if detected within 5 times the MB concentration. Affected results above the LOD are qualified with 'J+' flags indicating the results are estimated with a high bias and results below the LOD were qualified with 'UB' flags as false-positives and are considered non-detect up to the LOD. This flagging criteria is in accordance with the *Data Validation*

Guidelines Modules 1, 3, 3, and 4 Revised Table for Sample Qualification in the Presence of Blank Contamination (DoD, 2022).

The following method blank detections were determined to affect project-sample data quality:

- **ZF20024.** There were three method blank detections below the LOQ and LOD but above the DL. One PFOS result for CACMW-003-160-158.5-061724-P was affected; refer to the checklist and Table 1 for details.

Laboratory Control Samples and Duplicates

The laboratory analyzed and reported a laboratory control sample (LCS) for each preparatory batch, to assess laboratory extraction efficiency and analytical accuracy. In some cases, LCS duplicates (LCSDs) were used to assess analytical precision. LCS/LCSD recovery information and LCSD RPD information (where available) were reviewed.

There were no LCS/LCSD recovery or LCSD RPD failures that affected project-sample data quality; see checklists for details.

Matrix Spike Samples

Matrix spikes (MS) and MS duplicates (MSD) were analyzed for select organic batches, to evaluate potential matrix interference affecting accuracy and/or precision. Each SDG included at least one sample with additional volume submitted for project-specific MS/MSD analysis. MS/MSD recovery and RPDs were evaluated only if the parent sample (the sample spiked for the MS/MSD) was in the project-sample set. Additionally, MS/MSD recovery was only evaluated if the spiking concentration was greater than one-fourth the native analyte concentration, as a low spiking ratio (compared to native analyte concentration in the parent sample) does not yield useful recovery information.

There were no MS/MSD recovery or MS/MSD RPD failures determined to affect project-sample data quality.

Extracted Internal Standard Recoveries

Samples submitted for PFAS analysis were spiked with radio-labelled extracted internal standards (EIS; also referred to as isotope dilution analytes) to evaluate accuracy, check for matrix interference on a sample-specific basis, and to quantify the associated target analyte. Due to the nature of isotope dilution, a direction of bias is not inferred for EIS recovery failures; the results are quantitated using the EIS as an analyte-specific internal standard, thereby correcting for low or high bias.

There were no EIS recovery failures affecting project-sample data quality; refer to the checklists for details.

Field Duplicates

Field duplicate samples were collected and submitted blind to the laboratory at the required frequency (one per 10 primary samples). RPDs between field-duplicate results were calculated; where analytes were not detected, the LOD was used in the calculation. RPDs were compared to a MQO of 50% for soil.

There were no field duplicate RPD failures considered to affect project-sample data quality.

Equipment and Field Blanks

Samples CACMW-EB01-062624, CACMW-FB01-062124, and CACMW-FB02-062524 were collected as an equipment blank (EB) and field blanks (FBs) and were submitted with soil samples in SDG ZF28037; the EB and FBs were conservatively assumed to correspond to all soil samples in both SDGs. The EBs were used to check for potential cross-contamination of samples from the reusable sampling equipment (drill tooling). The FBs were used to check for potential cross-contamination of samples from sample handling processes. Where analytes were detected in the blanks, professional judgement was used to determine if data quality was affected for individual results, depending upon relative collection times and concentrations of associated samples. Affected results above the LOD are qualified with 'J+' flags indicating the results are estimated with a high bias and results below the LOD were qualified with 'UB' flags as false-positives and are considered non-detect up to the LOD.

The following EB and FB detections were considered to affect project-sample data quality:

- **ZF20024**. PFOS and PFBA were detected in CACMW-EB01-062624 and CACMW-FB02-062524. All PFOS results were considered affected; see checklist and Table 1 for details.
- **ZF28037**. PFOS and PFBA were detected in CACMW-EB01-062624 and CACMW-FB02-062524. All PFOS results were considered affected; see checklist and Table 1 for details.

Stage 2B Data Validation

The following sections summarize findings of a Stage 2B data validation, which includes review of instrument-level QC information. Only failures affecting project-sample data quality are discussed here; for more information, refer to the attached Stage 2B data validation checklists.

Additional Stage 2A 1633 PFAS Checks

Additional Stage 2A checks for the PFAS analysis are included in the Stage 2B data validation checklists and summarized here, as they are method-specific and are not covered by the standard ADEC Laboratory Data Review Checklist. For EPA Draft Method 1633, in accordance with the DoD Data Validation Guidelines Module 6, additional Stage 2A checks include ion ratios, non-extracted internal standards (NIS), low-level laboratory control samples (LLCS), bile salt interference, and qualitative identification standards compared to method or QSM criteria.

The following additional Stage 2A check failures were determined to affect project-sample data quality:

- **ZF28037**. PFHxS in samples CACMW-004-160-142.75-062424-P and CACMW-005-160-121.75-061824-P and PFOS in sample CACMW-006-160-137.5-061924-P had ion ratios outside laboratory limits. Affected results were qualified 'J' as estimated; see checklist and Table 1 for details.

Tuning & Instrument Performance

For LC-MS/MS methods, MS tune checks were evaluated against method-specific criteria. Instrument performance checks, such as mass calibration and mass peak, were reviewed where reported and compared to method or QSM criteria. There were no tuning or instrument performance anomalies affecting project-sample data quality.

Initial Calibration and Verification

The initial calibration for each analysis was reviewed, to check for compliance with method and/or QSM requirements. This included checking that an appropriate number of standards (calibration points) were used, the frequency of calibrations met method and/or project-specific QC requirements, and that the calibration curve met method requirements (e.g. an $r^2 \geq 0.99$). Initial calibrations were acceptable for each analysis.

ICV samples were verified to be from a second source and were reviewed to verify the accuracy of the initial calibration. ICV recoveries were within control limits for each calibration.

Continuing Calibration Verification and Instrument Sensitivity Check

Laboratory batch summaries and/or run logs were reviewed to check that all project samples were bracketed by CCVs, and that CCV percent recoveries were within control limits for target analytes. CCV analysis frequency and percent recoveries were acceptable.

The laboratory analyzed and reported instrument sensitivity checks (ISCs) to check instrument detection capabilities at the required reporting limits. Laboratory batch summaries and/or run logs were reviewed to check that an ISC was performed at least once daily prior to sample and analysis, and that ISC percent recoveries were within control limits. ISC performance and percent recoveries were acceptable.

Instrument Blanks

Laboratory batch summaries and/or run logs were reviewed to check that instrument blanks (IBs) were performed immediately following the highest standard analyzed, daily prior to analyzing standards, after each CCV, and immediately following samples with PFAS concentrations exceeding the quantitation range. Each IB analysis was

reviewed to check that IB target analyte concentrations were below one half of the LOQ. IB performance and target analyte concentrations were acceptable.

Stage 3 and 4 Data Validation

The following sections summarize findings of the 10% Stage 3 and Stage 4 data validation, which includes recalculation of select results (Stage 3) and qualitative review of analyte identification and quantitation (Stage 4). A random selection of 10% of project field samples per SDG were selected for recalculation. All instrument QC samples related to field sample analysis were recalculated. Associated preparatory-batch QC samples (MB, LCS/LCSD, MS/MSD) were recalculated. Only target analytes that were detected in one or more field samples were recalculated. For all selected samples, EIS recoveries were recalculated and compared to reported recoveries. Standards traceability was also reviewed.

For Stage 4 validation, target compound identification and manual integrations were reviewed as described below; there were no tentatively identified compounds reported for this project.

Instrument Calibration, Performance, and Instrument QC Samples

Initial calibrations were recalculated using raw instrument responses from the quantitation reports for calibration standards. The laboratory used an average response factor (RF) calibration for most methods and analytes, though linear regressions were used in some cases. Concentrations were calculated based on associated internal standards.

Initial calibration verification (ICV) and bracketing CCV percent recoveries were recalculated and verified against reported recoveries. As noted in the relevant Stage 2B section above, CCV recovery failures did not affect project-sample data quality. ICB and CCBs were recalculated and verified below 1/2 LOQ.

Field Samples and Field/Lab QC Samples

A random selection of 10% of field samples for each SDG were selected for Stage 3 recalculation; see Table 2 for a list of selected samples. For the selected field samples, all detected target analyte results were recalculated and compared to the reported results. Additionally, all EIS recoveries were recalculated and verified against reported percent recoveries.

At least one MB, LCS/LCSD, and MS/MSD per method and SDG were recalculated. When detections were reported in an associated blank (MB, FB, or EB), the sample was selected for recalculation. Overall, recalculated results matched reported results, with occasional slight differences likely due to rounding. For recalculations, no rounding was performed until the very end; the laboratory may have rounded intermediate values, accounting for the slight differences.

No anomalies were identified during recalculation of project field sample and field and lab QC sample results that could not be attributed to rounding differences.

Standards Traceability

Laboratory reports were reviewed to verify the certificates of analysis were included for all stock standard solutions, and that the standards used in the ICV were from a secondary source. Standards preparation logs were reviewed to check that stock standards were diluted properly into working standards for the ICAL and spiking solutions. Standards preparation logs appeared complete and there were no anomalies identified.

Target Compound Identification

Target compound identification was evaluated by qualitatively reviewing signal to noise ratios and relative retention times for target analyte peaks, and presence of valid spectra with passing mass/ion ratios (for MS methods). This evaluation was performed for roughly 10% of positive detections within the randomly selected samples; no anomalies were identified.

Manual Integrations

Manual integrations were noted in the case narratives and with "M" flags on associated results. There was an unusually high frequency of manual integrations in both work orders, for laboratory instrument QC samples, batch QC samples, and field samples, including nearly all detections in field samples. In each case, the justification listed was "incorrect auto integration." A representative selection of manual integrations was reviewed, comparing the chromatograms before and after manual integration. In general, manual integrations were consistently performed across all field and QC samples and appeared appropriate. However, justification for manual integrations could have been more descriptive (e.g. base-line correction, split peak, etc.).

Summary of Data Quality Indicators

The following sections summarize the findings of the above review with respect to the six data quality indicators: sensitivity, precision, accuracy, representativeness, comparability, and completeness.

Sensitivity

Sensitivity describes the ability of the sampling and analytical methodology to meet detection and/or quantitation limit objectives. Analytical sensitivity was evaluated by checking that LODs for non-detect results were below relevant PSLs. A non-detect result is considered to be adequately sensitive if the LOD is below the PSL.

All non-detect results had LODs below relevant PSLs. Overall analytical sensitivity is deemed acceptable for the purposes of this project.

Precision

Precision is a measure of the reproducibility of repetitive measurements. Precision was evaluated based on laboratory QC-sample RPDs and field-duplicate RPDs. No sample results were affected by MSD or field duplicate RPD failures. Overall precision is deemed acceptable for the purposes of this project.

Accuracy

Accuracy is a measure of the correctness, or the closeness, between the true value and the quantity detected. Accuracy was evaluated based on target-analyte recoveries for laboratory batch-level and instrument-level QC samples, and surrogate recoveries for project samples. Accuracy also may be affected by sample contamination identified in blank samples, or by sample handling, preservation, or holding time anomalies.

No results were affected by LCS/LCSD, MS/MSD, or EIS recovery failures. A total of 36 results were affected by sample contamination identified in blank samples (MB, EB, and/or FB). Three results were affected by ion ratio failures. Impact to data usability was generally minor. Target analyte and/or EIS recoveries for laboratory QC samples and select field samples were verified through Stage 3 recalculations, with no significant discrepancies identified that would impact project-sample data quality. Overall accuracy is deemed acceptable for the purposes of this project.

Representativeness

Representativeness describes the degree to which data accurately and precisely represent site characteristics. Representativeness is affected by factors such as sample frequency and matrix or contaminant heterogeneity, as well as analytical performance (including sensitivity, accuracy, and precision), sample preservation, handling, and holding times, and sample cross-contamination.

Samples were collected in accordance with an approved work plan, and MQOs defined in the UFP-QAPP were generally met. Sensitivity, precision, and accuracy were acceptable for the purposes of this project. Results qualified due to QC anomalies affecting precision and accuracy are usable as qualified but are not wholly representative of site conditions. Overall, results were considered adequately representative of environmental conditions for the purposes of this project.

Comparability

Comparability describes whether two data sets can be considered equivalent with respect to project goals. Comparability is affected by factors such as sampling methodology and analytical performance (including sensitivity, accuracy, and precision). Comparability was evaluated by checking that standard analytical methods were employed, and analytical performance was acceptable.

Data review findings generally support that the dataset is comparable. Overall comparability should be evaluated by the project team considering sample collection methodology and historic results alongside data quality and analytical methodology.

Completeness

Completeness describes the amount of valid data obtained from the sampling event(s). It is calculated as the percentage of usable measurements compared to the total number of measurements. No results were recommended for rejection in this review. The dataset is 100% complete.

Conclusions

Sensitivity, precision, accuracy, representativeness, comparability, and completeness were deemed acceptable, and the data are usable for the purposes of this project. Stage 3/4 validation confirmed target analytes were appropriately identified and quantitated and that results were appropriately calculated. There was an unusual frequency of manual integrations, however in general they appeared to have been appropriately and consistently performed. A total of 38 results were qualified due to QC anomalies and no results were recommended for rejection. Qualified results are listed in Table 1.

Limitations

This review was based solely on information provided by the analytical laboratory in the laboratory reports and staged electronic data deliverables for the SDGs reviewed. A data quality assessment reduces the risk of reliance on data of compromised quality; however, it does not eliminate that risk.

Definitions:

ng/g	nanograms per gram
SDG	sample delivery group
CAS	Chemical Abstract Service registry number
DL	detection limit
LOD	limit of detection
LOQ	limit of quantitiation
QC	quality control

Notes:

FB	Field or equipment blank detection
Ion_ratio	Ion ratio failure
MB	Method blank detection

Flags:

J+	The result is estimated with a high bias.
UB	The result is considered not detected (less than the listed reporting limit) due to sample contamination identified in an associated blank sample.
J	The result is estimated with an unknown bias.
M	The manual integration laboratory qualifier has been preserved with the data as informational data for the end user; there was no impact on the data usability.

Lab Flags:

B	Detected in the method blank
J	Estimated result < LOQ and > DL
M	Manual integration

Key

	from reported calibration
	from lab report/SEDD
	calculated value/comparison

Avg	average
RF	response factor
Conc.	concentration
Calc.	calculated
RSD	relative standard deviation
RSE	relative standard error
IS	internal standard

Linear Regressions

Key

	from quantitation report
	from reported calibration
	from lab report/EDD
	calculated value/comparison

%R	percent recovery
Avg	average
Calc.	calculated
CAS	Chemical Abstract Service registry number
CF	concentration factor
Conc.	concentration
EIS	extracted internal standard
IS	internal standard
ND	not detected
ng/L	nanograms per liter
RF	response factor

Key

	from quantitation report
	from reported calibration
	from lab report/SEDD
	calculated value/comparison

%R	percent recovery
Avg	average
Calc.	calculated
CAS	Chemical Abstract Service registry number
CF	concentration factor
Conc.	concentration
EIS	extracted internal standard
g	grams
IS	internal standard
mL	milliliters
ND	not detected
ng/g	nanograms per gram
ng/L	nanograms per liter
On Col.	on column
RF	response factor
RPD	relative percent difference

ADEC Contaminated Sites Program Laboratory Data Review Checklist

Completed By:	Leslie Brooks	**CS Site Name:**	Eielson AFB Basewide PFAS	**Lab Name:**	Pace Analytical Services
Title:	Environmental Scientist	**ADEC File No.:**	107.38.150	**Lab Report No.:**	ZF20024
Consulting Firm:	Arctic Data Services	**Hazard ID No.:**	26773	**Lab Report Date:**	August 6, 2024

Note: *Any N/A or No box checked must have an explanation in the comments box.*

1. **Laboratory**

   a. Did an ADEC Contaminated Sites Laboratory Approval Program (CS-LAP) approved laboratory receive and perform all of the submitted sample analyses?
   Yes ☒ No ☐ N/A ☐
   Comments: All samples were received and analyzed by Pace Analytical Services – West Columbia, South Carolina. The laboratory is ADEC CS approved for the analyses performed, where required

   b. If the samples were transferred to another "network" laboratory or sub-contracted to an alternate laboratory, was the laboratory performing the analyses CS-LAP approved?
   Yes ☐ No ☐ N/A ☒
   Comments: No samples were transferred to or analyzed by another laboratory.

2. **Chain of Custody (CoC)**

   a. Is the CoC information completed, signed, and dated (including released/received by)?
   Yes ☒ No ☐ N/A ☐
   Comments: Click or tap here to enter text.

   b. Were the correct analyses requested?
   Yes ☒ No ☐ N/A ☐
   Analyses requested: : PFAS (1633)
   Comments: Click or tap here to enter text.

3. **Laboratory Sample Receipt Documentation**

   a. Is the sample/cooler temperature documented and within range at receipt (0° to 6° C)?
   Yes ☒ No ☐ N/A ☐

Cooler temperature(s): 2.5
Comments: Samples were received within acceptable temperature range.

b. Is the sample preservation acceptable – acidified waters, methanol preserved soil (GRO, BTEX, VOCs, etc.)?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

c. Is the sample condition documented – broken, leaking, zero headspace (VOA vials); canister vacuum/pressure checked and no open valves, etc.?
Yes ☒ No ☐ N/A ☐
Comments: Samples were received in good condition.

d. If there were any discrepancies, were they documented? For example, incorrect sample containers/preservation, sample temperature outside of acceptable range, insufficient or missing samples, canister not holding a vacuum, etc.?
Yes ☐ No ☐ N/A ☒
Comments: There were no sample receiving discrepancies.

e. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability are not affected.

4. Case Narrative

a. Is the case narrative present and understandable?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

b. Are there discrepancies, errors, or QC failures identified by the lab?
Yes ☐ No ☒ N/A ☐
Comments: The laboratory report case narrative documented QC anomalies which are addressed in the following relevant sections of this checklist.

c. Were all the corrective actions documented?
Yes ☐ No ☐ N/A ☒
Comments: No corrective actions were performed.

d. What is the effect on data quality/usability according to the case narrative?
Comments: The case narrative made no comments on data quality or usability.

5. Sample Results

a. Are the correct analyses performed/reported as requested on CoC?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

b. Are all applicable holding times met?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

c. Are all soils reported on a dry weight basis?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

d. Are the reported limits of quantitation (LoQ) or limits of detections (LOD), or reporting limits (RL) less than the Cleanup Level or the action level for the project?
Yes ☒ No ☐ N/A ☐
Comments: LOQs and LODs for non-detect results were compared to the Project Screening Levels (PSLs) as defined in Worksheet #15 of the UFP-QAPP.

e. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

6. QC Samples

a. Method Blank

i. Was one method blank reported per matrix, analysis, and 20 samples?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

ii. Are all method blank results less than LOQ (or RL)?
Yes ☒ No ☐
Comments: The following were detected in method blanks below the LOQ and LOD but above the DL:
Batch 15153 PFHxS 0.023 ng/g
Batch 15153 PFOS 0.024 ng/g
Batch 15275 PFOS 0.026 ng/g

iii. If above LoQ or RL, what samples are affected?
Comments: Project-sample results are considered affected if the analyte in question is detected within five times (5X) the associated method blank concentration. The PFOS result for sample CACMW-003-160-158.5-061724-P is considered affected.

iv. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?
Yes ☒ No ☐ N/A ☐
Comments: Affected results below the LOD were qualified with a "UB" as false-positives and are considered non-detect up to the LOD.

v. Data quality or usability affected?
Yes ☒ No ☐ N/A ☐
Comments: Data quality is affected as described above. Refer to the data quality assessment for discussion of potential impacts to data usability.

b. Laboratory Control Sample/Duplicate (LCS/LCSD)

i. Organics – Are one LCS/LCSD reported per matrix, analysis and 20 samples? (LCS/LCSD required per AK methods, LCS required per SW846)
Yes ☐ No ☒ N/A ☐
Comments: Batches 15153 and 15154 had no sample duplicate.

ii. Metals/Inorganics – Are one LCS and one sample duplicate reported per matrix, analysis and 20 samples?
Yes ☐ No ☐ N/A ☒
Comments: No inorganic methods were performed in this work order.

iii. Accuracy – Are all percent recoveries (%R) reported and within method or laboratory limits and project specified objectives, if applicable? (AK Petroleum methods: AK101 60%-120%, AK102 75%-125%, AK103 60%-120%; all other analyses see the laboratory QC pages)
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iv. Precision – Are all relative percent differences (RPD) reported and less than method or laboratory limits and project specified objectives, if applicable? Was the RPD reported from LCS/LCSD, and or sample/sample duplicate? (AK Petroleum methods 20%; all other analyses see the laboratory QC pages)
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

v. If %R or RPD is outside of acceptable limits, what samples are affected?
Comments: N/A; there were no %R or RPD failures.

vi. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒
Comments: No samples were affected.

vii. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

c. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

i. Organics – Are one MS/MSD reported per matrix, analysis and 20 samples?
Yes ☒ No ☐ N/A ☐
Comments: Sample CACMW-003-160-158.5-061724-P was submitted with additional volume for MS/MSD analysis.

ii. Metals/Inorganics – Are one MS/MSD reported per matrix, analysis and 20 samples?
Yes ☐ No ☐ N/A ☒
Comments: No inorganic methods were performed in this work order.

iii. Accuracy – Are all percent recoveries (%R) reported and within method or laboratory limits and project specified objectives, if applicable?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iv. Precision – Are all relative percent differences (RPD) reported and less than method or laboratory limits and project specified objectives, if applicable? RPD reported from MS/MSD, and or sample/sample duplicate.
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

v. If %R or RPD is outside of acceptable limits, what samples are affected?
Comments: There were no %R or RPD failures.

vi. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒
Comments: No samples were affected.

vii. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

d. Surrogates – Organics Only or Isotope Dilution Analytes (IDA) – Isotope Dilution Methods Only

i. Are surrogate/IDA recoveries reported for organic analyses – field, QC, and laboratory samples?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

ii. Accuracy – Are all percent recoveries (%R) reported and within method or laboratory limits and project specified objectives, if applicable? (AK Petroleum methods 50-150 %R for field samples and 60-120 %R for QC samples; all other analyses see the laboratory report pages)
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iii. Do the sample results with failed surrogate/IDA recoveries have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒
Comments: There were no IDA recovery failures.

iv. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

e. Trip Blanks

i. Is one trip blank reported per matrix, analysis, and for each cooler containing volatile samples? Yes ☐ No ☐ N/A ☒
Comments: No volatile analyses were performed in this work order.

ii. Are all results less than LoQ or RL?
Yes ☐ No ☐ N/A ☒
Comments: N/A; see above.

iii. If above LoQ or RL, what samples are affected?
Comments: N/A; see above.

iv. Is the data quality or usability affected?
Yes ☐ No ☐ N/A ☒
Comments: N/A; see above.

f. Field Duplicate

i. Are one field duplicate submitted per matrix, analysis, and 10 project samples?
Yes ☐ No ☒ N/A ☐
Comments: The following field duplicate pair was submitted in this work order: CACMW-003-160-108.5-061724-P / CACMW-SO-FD01-061724

ii. Was the duplicate submitted blind to lab?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iii. Precision – All relative percent differences (RPD) less than specified project objectives? (Recommended: 30% water or air, 50% soil)

$$RPD\ (\%) = \left| \frac{R_1 - R_2}{\left(\frac{R_1 + R_2}{2}\right)} \right| X\ 100$$

Where R_1 = Sample Concentration

R_2 = Field Duplicate Concentration

Is the data quality or usability affected? (Explain)

Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iv. Is the data quality or usability affected? (Explain)
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

g. Decontamination or Equipment Blanks

i. Were decontamination or equipment blanks collected?
Yes ☒ No ☐ N/A ☐
Comments: The following field blanks and equipment blanks were reported in SDG ZF28037: CACMW-EB01-062624, CACMW-FB01-062124 CACMW-FB02-062524

ii. Are all results less than LoQ or RL?
Yes ☐ No ☒ N/A ☐
Comments: See checklist ZF28037 for details.

iii. If above LoQ or RL, specify what samples are affected.
Comments: Project-sample results are considered affected if the analyte in question is detected within five times (5X) the associated blank concentration. PFOS results in all samples in this work order are considered affected

iv. Are data quality or usability affected?
Yes ☒ No ☐ N/A ☐
Comments: Affected results below the LOD were qualified with a "UB" as false-positives and are considered non-detect up to the LOD and results above the LOD were qualified with a “J+” as estimated with high bias. Refer to the data quality assessment for discussion of potential impacts to data usability.

7. Other Data Flags/Qualifiers (ACOE, AFCEE, Lab Specific, etc.)

a. Are they defined and appropriate?

Yes ☒ No ☐ N/A ☐

Comments: Click or tap here to enter text.

ADEC Contaminated Sites Program Laboratory Data Review Checklist

Completed By:	Leslie Brooks	**CS Site Name:**	Eielson AFB Basewide PFAS	**Lab Name:**	Pace Analytical Services
Title:	Environmental Scientist	**ADEC File No.:**	107.38.150	**Lab Report No.:**	ZF28037
Consulting Firm:	Arctic Data Services	**Hazard ID No.:**	26773	**Lab Report Date:**	August 6, 2024

Note: *Any N/A or No box checked must have an explanation in the comments box.*

1. **Laboratory**

   a. Did an ADEC Contaminated Sites Laboratory Approval Program (CS-LAP) approved laboratory receive and perform all of the submitted sample analyses?
   Yes ☒ No ☐ N/A ☐
   Comments: All samples were received and analyzed by Pace Analytical Services – West Columbia, South Carolina. The laboratory is ADEC CS approved for the analyses performed, where required

   b. If the samples were transferred to another "network" laboratory or sub-contracted to an alternate laboratory, was the laboratory performing the analyses CS-LAP approved?
   Yes ☐ No ☐ N/A ☒
   Comments: No samples were transferred to or analyzed by another laboratory.

2. **Chain of Custody (CoC)**

   a. Is the CoC information completed, signed, and dated (including released/received by)?
   Yes ☒ No ☐ N/A ☐
   Comments: Click or tap here to enter text.

   b. Were the correct analyses requested?
   Yes ☒ No ☐ N/A ☐
   Analyses requested: : PFAS (1633)
   Comments: Click or tap here to enter text.

3. **Laboratory Sample Receipt Documentation**

   a. Is the sample/cooler temperature documented and within range at receipt (0° to 6° C)?
   Yes ☒ No ☐ N/A ☐

Cooler temperature(s): 4.3
Comments: Samples were received within acceptable temperature range.

b. Is the sample preservation acceptable – acidified waters, methanol preserved soil (GRO, BTEX, VOCs, etc.)?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

c. Is the sample condition documented – broken, leaking, zero headspace (VOA vials); canister vacuum/pressure checked and no open valves, etc.?
Yes ☒ No ☐ N/A ☐
Comments: Samples were received in good condition.

d. If there were any discrepancies, were they documented? For example, incorrect sample containers/preservation, sample temperature outside of acceptable range, insufficient or missing samples, canister not holding a vacuum, etc.?
Yes ☐ No ☐ N/A ☒
Comments: There were no sample receiving discrepancies.

e. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability are not affected.

4. Case Narrative

a. Is the case narrative present and understandable?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

b. Are there discrepancies, errors, or QC failures identified by the lab?
Yes ☐ No ☒ N/A ☐
Comments: The laboratory report case narrative documented QC anomalies which are addressed in the following relevant sections of this checklist.

c. Were all the corrective actions documented?
Yes ☒ No ☐ N/A ☐
Comments: The following corrective actions were noted in the case narrative.
For samples ZF28037-024, ZF28037-026 sample matrix prevented full volume from being extracted, precluding method mandated bottle rinse. Elution solvent was aliquoted directly into the reservoir, rinsing the inside. Surrogate recovery may be adversely affected.
The following sample was diluted due to the nature of the sample matrix: ZF28037-024. The LOQ has been elevated to reflect the dilution. Sample was diluted due to being foamy.
Sample ZF28037-024 had surrogates recovered outside of the acceptance limits.

The sample was reextracted outside the holding time. Both analysis results are reported.

d. What is the effect on data quality/usability according to the case narrative?
Comments: The case narrative made no comments on data quality or usability.

5. Sample Results

a. Are the correct analyses performed/reported as requested on CoC?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

b. Are all applicable holding times met?
Yes ☐ No ☒ N/A ☐
Comments: Reanalysis for sample CACMW-EB01-062624 was extracted 5 days past the recommended 28-day extraction holding time. Field QC samples are not flagged.

c. Are all soils reported on a dry weight basis?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

d. Are the reported limits of quantitation (LoQ) or limits of detections (LOD), or reporting limits (RL) less than the Cleanup Level or the action level for the project?
Yes ☒ No ☐ N/A ☐
Comments: LOQs and LODs for non-detect results were compared to the Project Screening Levels (PSLs) as defined in Worksheet #15 of the UFP-QAPP.

e. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

6. QC Samples

a. Method Blank

i. Was one method blank reported per matrix, analysis, and 20 samples?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

ii. Are all method blank results less than LOQ (or RL)?
Yes ☒ No ☐
Comments: Click or tap here to enter text.

iii. If above LoQ or RL, what samples are affected?

Comments: NA; there were no method blank detections.

iv. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒
Comments: N/A; see above.

v. Data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

b. Laboratory Control Sample/Duplicate (LCS/LCSD)

i. Organics – Are one LCS/LCSD reported per matrix, analysis and 20 samples? (LCS/LCSD required per AK methods, LCS required per SW846)
Yes ☐ No ☒ N/A ☐
Comments: Batches 14645, 14850, 15135, and 15761 had no sample duplicates.

ii. Metals/Inorganics – Are one LCS and one sample duplicate reported per matrix, analysis and 20 samples?
Yes ☐ No ☐ N/A ☒
Comments: No inorganic methods were performed in this work order.

iii. Accuracy – Are all percent recoveries (%R) reported and within method or laboratory limits and project specified objectives, if applicable? (AK Petroleum methods: AK101 60%-120%, AK102 75%-125%, AK103 60%-120%; all other analyses see the laboratory QC pages)
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iv. Precision – Are all relative percent differences (RPD) reported and less than method or laboratory limits and project specified objectives, if applicable? Was the RPD reported from LCS/LCSD, and or sample/sample duplicate? (AK Petroleum methods 20%; all other analyses see the laboratory QC pages)
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

v. If %R or RPD is outside of acceptable limits, what samples are affected?
Comments: N/A; there were no %R or RPD failures.

vi. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒

Comments: No samples were affected.

vii. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

c. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

i. Organics – Are one MS/MSD reported per matrix, analysis and 20 samples?
Yes ☒ No ☐ N/A ☐
Comments: Sample CACMW-004-160-92.75-062424-P was submitted with additional volume for MS/MSD analysis.

ii. Metals/Inorganics – Are one MS/MSD reported per matrix, analysis and 20 samples?
Yes ☐ No ☐ N/A ☒
Comments: No inorganic methods were performed in this work order.

iii. Accuracy – Are all percent recoveries (%R) reported and within method or laboratory limits and project specified objectives, if applicable?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iv. Precision – Are all relative percent differences (RPD) reported and less than method or laboratory limits and project specified objectives, if applicable? RPD reported from MS/MSD, and or sample/sample duplicate.
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

v. If %R or RPD is outside of acceptable limits, what samples are affected?
Comments: There were no %R or RPD failures.

vi. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒
Comments: No samples were affected.

vii. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

d. Surrogates – Organics Only or Isotope Dilution Analytes (IDA) – Isotope Dilution Methods Only

i. Are surrogate/IDA recoveries reported for organic analyses – field, QC, and laboratory samples?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

ii. Accuracy – Are all percent recoveries (%R) reported and within method or laboratory limits and project specified objectives, if applicable? (AK Petroleum methods 50-150 %R for field samples and 60-120 %R for QC samples; all other analyses see the laboratory report pages)
Yes ☐ No ☒ N/A ☐
Comments: Recoveries for IDA 13C2-Perfluorotetradecanoic acid, d-MeFOSA, and d-EtFOSA were below laboratory limits in sample CACMW-EB01-062624.

iii. Do the sample results with failed surrogate/IDA recoveries have data flags? If so, are the data flags clearly defined?
Yes ☐ No ☐ N/A ☒
Comments: Field QC samples are not flagged.

iv. Is the data quality or usability affected?
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

e. Trip Blanks

i. Is one trip blank reported per matrix, analysis, and for each cooler containing volatile samples? Yes ☐ No ☐ N/A ☒
Comments: No volatile analyses were performed in this work order.

ii. Are all results less than LoQ or RL?
Yes ☐ No ☐ N/A ☒
Comments: N/A; see above.

iii. If above LoQ or RL, what samples are affected?
Comments: N/A; see above.

iv. Is the data quality or usability affected?
Yes ☐ No ☐ N/A ☒
Comments: N/A; see above.

f. Field Duplicate

i. Are one field duplicate submitted per matrix, analysis, and 10 project samples?
Yes ☐ No ☒ N/A ☐
Comments: The following field duplicate pairs were submitted in this work order:
CACMW-007-160-33-062024-P / CACMW-SO-FD02-062024
(CACMW-008-160-127-062124-P) / CACMW-SO-FD03-062124
CACMW-004-160-142.75-062424-P / CACMW-SO-FD04-062424

ii. Was the duplicate submitted blind to lab?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iii. Precision – All relative percent differences (RPD) less than specified project objectives? (Recommended: 30% water or air, 50% soil)

$$RPD\ (\%) = \left| \frac{R_1 - R_2}{\left(\frac{R_1 + R_2}{2}\right)} \right| X\ 100$$

Where R_1 = Sample Concentration

R_2 = Field Duplicate Concentration

Is the data quality or usability affected? (Explain)

Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

iv. Is the data quality or usability affected? (Explain)
Yes ☐ No ☒ N/A ☐
Comments: Data quality and usability were not affected.

g. Decontamination or Equipment Blanks

i. Were decontamination or equipment blanks collected?
Yes ☒ No ☐ N/A ☐
Comments: The following field blanks and equipment blanks were reported in SDG ZF28037: CACMW-EB01-062624, CACMW-FB01-062124 CACMW-FB02-062524

ii. Are all results less than LoQ or RL?
Yes ☐ No ☒ N/A ☐
Comments: The following detections were above the LOQ:
CACMW-EB01-062624 PFOS 5.6 ng/l (initial)
The following were detected below the LOQ and LOD but above the DL:

CACMW-EB01-062624	PFBA 3.3 ng/l (initial)
CACMW-EB01-062624	PFOS 4.6 ng/l (reanalysis)
CACMW-FB02-062524	PFBA 1.1 ng/l
CACMW-FB02-062524	PFOS 1.5 ng/l

iii. If above LoQ or RL, specify what samples are affected.
Comments: Project-sample results are considered affected if the analyte in question is detected within five times (5X) the associated blank concentration. PFOS results in all samples in this work order are considered affected

iv. Are data quality or usability affected?
Yes ☒ No ☐ N/A ☐
Comments: Affected results below the LOD were qualified with a "UB" as false-positives and are considered non-detect up to the LOD and results above the LOD were qualified with a “J+” as estimated with high bias. Refer to the data quality assessment for discussion of potential impacts to data usability.

7. Other Data Flags/Qualifiers (ACOE, AFCEE, Lab Specific, etc.)

a. Are they defined and appropriate?
Yes ☒ No ☐ N/A ☐
Comments: Click or tap here to enter text.

SDG:	ZF20024
Lab Name:	Pace
Completed By:	Leslie Brooks
Date:	10/2/2024
Methods (types) reviewed	1633 (LC-MS/MS)

	Yes	No	N/A
Additional Stage 2A 1633 PFAS Checks			
Ion ratios within 50-150% of ion ratio of applicable calibration standard?	X		
Extracted Internal Standard (EIS) recovery within 20-150% or laboratory limits?	X		
EIS retention time within 0.40 minutes of retention time of applicable standard?	X		
Non-Extracted Internal Standards (NIS) peak area greater than 30% of the average area of the calibration standards or within laboratory limits?	X		
NIS retention time within 0.40 minutes of retention time of applicable standard?	X		
Laboratory Control (LCS) and Low-Level Laboratory Control Sample (LLLCS) are prepared in every preparation batch of 20 environmental samples and recovery within control limits?	X		
Bile Salt Interference Check reported and PFOS and TDCA separated by at least 1 minute	X		
Qualitative Identification Standard containing a mix of branched and linear isomers analyzed once daily prior to sample analysis?	X		
Comments: PFNA in sample CACMW-002-160-82.25-061524-P and PFHxS in sample CACMW-001-160-16.5-061124-P had ion rations outside 50-150% of the ion ratio of the midpoint calibration standard. However, these detections were below the LOQ and within 50-150% of the ion ratio of the initial daily CCV and qualification was not required.			
General			
Preparation and analysis run logs reported and complete?	X		
Bench logs and data sheets reported and complete? *(where relevant)*	X		
Comments:			
Tuning and Instrument Performance			
Mass Calibration and Mass Calibration Verification performed prior to initial calibration	X		
Verify the peak apex for each mass did not shift more than 0.2 Da (or amu) from the expected masses for each target analyte.	X		
Comments:			
Initial Calibration			
Initial calibration performed at the required frequency? *(generally prior to sample analysis or after ICV/CCV failure)*	X		

	Yes	No	N/A
Does the calibration include the minimum number of levels? *(6 for Avg. RF or linear with 5 within quantification range and 1 additional if second order)*	X		
Does the calibration meet method criteria? *(RSD or RSE < 20%)*	X		
Comments:			
Initial (Secondary Source), Continuing Calibration Verification, and Instrument Sensitivity Check			
Initial calibration verification (ICV) performed after initial calibration with second source standard?	X		
ICV within method criteria? *(%D <30%)*	X		
Instrument Sensitivity Check (ISC) performed at least once daily prior to sample analysis?	X		
ISC within method criteria? *(%D <30%)*	X		
Continuing calibration verification (CCV) performed at the required frequency? *(bracketing all field samples and after every 10 field samples)*	X		
CCVs within method criteria? *(%D <30%)*	X		
Comments:			
Instrument Blanks			
Instrument Blanks performed at the required frequency? (*immediately following the highest standard analyzed, daily prior to analyzing standards, after each CV, and immediately following samples with PFAS concentrations exceeding the quantification range*)	X		
IB target analyte concentrations below ½ LOQ?	X		
Comments:			
Other QC			
No other instrument-level QC failures or anomalies?		X	
Comments:

Data Quality Assessment

This letter summarizes the findings of a data quality assessment (DQA) conducted by Arctic Data Services, LLC (ADS) for the above-referenced project data on behalf of Arcadis U.S., Inc. Precision, accuracy, sensitivity, representativeness, comparability, and completeness of the data was evaluated by reviewing laboratory-supplied quality assurance/quality control (QA/QC) information as well as conducting independent QA/QC checks on the data. A Stage 2A data validation was performed on 100% of project sample data, and a Stage 2B data validation was performed on 100% of project sample per- and polyfluoroalkyl substances (PFAS) data, in general accordance with the DoD *General Data Validation Guidelines* (2019) and method-specific modules, where they exist, and the *Uniform Federal Policy – Quality Assurance Project Plan, Data Gap Investigation & Groundwater Pilot Study Construction in Support of the Groundwater Response Action for PFAS Treatment at Site FT009P* (Ahtna Solutions-Arcadis 8(a) Joint Venture, LLC, 2024). Stage 2B validation includes reviewing sample handling, custody, sample-batch level QC information, and instrument-level QC data; applying data qualifiers to sample results affected by anomalies and QC failures; and summarizing the impacts to data quality. This validation meets the requirements of the Alaska Department of Environmental Conservation (ADEC) *Technical Memorandum 22-001, Guidelines for Data Reporting* (August 2022). Additionally, Stage 4 data validation was performed on 10% of the project sample data relating to analysis of PFAS as described in the Stage 4 Validation section below; Stage 4 data validation includes Stage 3 recalculation of field and QC sample results.

Laboratory QC-sample recoveries and relative percent differences (RPDs) were compared to measurement quality objectives (MQOs) specified in the UFP-QAPP, EPA Draft Method 1633, and/or laboratory control limits. Field-duplicate RPDs were compared to MQOs defined in Worksheet #12 of the UFP-QAPP for the applicable matrix. Limits of quantitation (LOQs) and limits of detection (LODs) were compared to project screening levels (PSLs) listed in Worksheet #15 of the 2024 UFP-QAPP to evaluate analytical sensitivity.

ADEC laboratory data review checklists (attached) were completed for each laboratory work order and summarize Stage 2A data validation findings. Separate checklists were prepared summarizing Stage 2B data validation findings and are also attached. Table 1 (attached) provides a list of qualified results. Table 2 lists the samples that were randomly selected for Stage 3/4 validation. Tables 3 through 5 summarize results recalculated in the course of Stage 3 data validation. The following sections provide a summary of data validation findings for each QA/QC element reviewed; failures or anomalies that had no impact to data quality are discussed in the checklists and are not further described herein.

Sample Analysis Summary

A total of 27 groundwater samples (including field duplicates) were collected and submitted in three sample delivery groups (SDGs) to Pace Analytical for analysis of the following:

- Alkalinity by EPA Method 2320B;
- Total organic carbon (TOC) by EPA Method 5310C;
- Total dissolved solids (TDS) by EPA Method 2540C;
- Total suspended solids (TSS) by EPA Method 2540D;
- Anions by EPA Method 300.0;
- Nitrate/Nitrite by EPA Method 353.2;
- Resource Conservation and Recovery Act (RCRA) metals by EPA Methods 6020A and 7470A;
- Total and dissolved iron, manganese, calcium, and magnesium by EPA Method 6010C and;
- Hardness by EPA Method 130.1.

An additional three SDGs of the same 27 groundwater samples were submitted to Pace Columbia for analysis of:

- Per- and polyfluoroalkyl substances (PFAS) by EPA Draft Method 1633

Stage 2A Data Validation

The following sections summarize findings of a Stage 2A data validation, which includes review of preparatory-batch-level QC information. Only failures affecting project-sample data quality are discussed here; for more information, refer to the attached ADEC laboratory data review checklists.

Sample Preservation, Handling, Custody, and Holding Times

Sample receipt forms were reviewed to check that samples were received in good condition, properly preserved, and within the required temperature range. Chain of custody forms were reviewed to confirm that custody was not breached during sample handling. Dates of sample collection, preparation, and analysis were compared to check that method holding times were not exceeded.

The following holding time exceedances affected project-sample data quality.

- **ZG13006**. Reanalysis of sample CACMW-003-160-071124 was extracted for PFAS analysis 5 days past the recommended 28-day extraction holding time. A total of 40 results were affected and are qualified as estimated ('J' for detects and 'UJ' for non-detects); see checklist and Table 1 for details.
- **ZG18020**. Reanalysis for samples CACMW-004-110-071224, CACMW-004-160-071224, CACMW-005-160-071224, and CACMW-GW-FD01-071224 were extracted for PFAS 5 days past the recommended 28-day extraction holding time. A total of results 160 were affected and are qualified as estimated ('J' for detects and 'UJ' for non-detects); see checklist and Table 1 for details.

Method Blanks

The laboratories analyzed and reported a method blank (MB) sample for each preparatory batch, to check for laboratory-based sample contamination. If and where analytes were detected in a MB, corresponding project-sample results were compared to the MB concentration and were considered potentially affected if detected within 5 times the MB concentration. Affected results above the LOD are qualified with 'J+' flags indicating the results are estimated with a high bias and results below the LOD were qualified with 'UB' flags as false-positives and are considered non-detect up to the LOD. This flagging criteria is in accordance with the *Data Validation Guidelines Modules 1, 3, 3, and 4 Revised Table for Sample Qualification in the Presence of Blank Contamination* (DoD, 2022).

There were no method blank detections determined to affect project-sample data quality; see checklists for details.

Laboratory Control Samples and Duplicates

The laboratory analyzed and reported a laboratory control sample (LCS) for each preparatory batch, to assess laboratory extraction efficiency and analytical accuracy. In some cases, LCS duplicates (LCSDs) were used to assess analytical precision. LCS/LCSD recovery information and LCSD RPD information (where available) were reviewed.

The following LCS/LCSD recovery and LCSD RPD failures were determined to affect project-sample data quality:

- **L1756419**. LCS recovery of total suspended solids (TSS) was below control limits in batches WG2322808 and WG2322815. TSS results for five project samples are considered affected and were qualified 'J-' as estimated with low bias. See checklist and Table 1 for details.

Matrix Spike Samples

Matrix spikes (MS) and MS duplicates (MSD) were analyzed for select organic batches, to evaluate potential matrix interference affecting accuracy and/or precision. MS/MSD recovery and RPDs were evaluated only if the parent sample (the sample spiked for the MS/MSD) was in the project-sample set. Additionally, MS/MSD recovery was only evaluated if the spiking concentration was greater than one-fourth the native analyte concentration, as a low spiking ratio (compared to native analyte concentration in the parent sample) does not yield useful recovery information.

Samples CACMW-003-160-071124 and CACMW-006-060-071524 were submitted with additional volume for project-specific MS/MSD analysis. Additionally, the laboratory performed MS/MSD analysis on several samples for batch QC purposes.

The following MS/MSD recovery failures and MSD RPD failures were determined to affect project-sample data quality:

- **L1758081.** MS recovery for chloride was below control limits in the MS of parent sample CAMW-004-110-071224. The affected result was qualified 'J-' as estimated with low bias; see checklist and Table 1 for details.
- **L1758446.** There were five MS/MSD recovery failures. Three project-sample results were affected by the recovery failures and qualified as estimated, biased low ('J-' for detections, 'UJ' for non-detects). Refer to the checklist and Table 1 for details.
- **ZG13006.** There were four MS/MSD recovery failures and four MSD RPD failures in the initial MS/MSD PFAS analysis of parent sample CACMW-003-160-071124. Four results were affected by the recovery failures. Perfluorotridecanoic acid (PFTriA) and perfluorodecanesulfonic acid (PFDS) were qualified 'UJ' as estimated with low bias. 11-chloroeicosafluoro-3-oxaundecane-1-sulfonic acid (11Cl-PF3OUdS) and perfluorododecanesulfonic acid (PFDOS) were qualified 'X' as recommended for rejection due to extremely low recovery. See checklist and Table 1 for details.

Extracted Internal Standard Recoveries

Samples submitted for PFAS analysis were spiked with radio-labelled extracted internal standards (EIS; also referred to as isotope dilution analytes) to evaluate accuracy, check for matrix interference on a sample-specific basis, and to quantify the associated target analyte(s). Due to the nature of isotope dilution, a direction of bias is not inferred for EIS recovery failures; the results are quantitated using the EIS as an analyte-specific internal standard, thereby correcting for low or high bias.

The following EIS recovery failures were determined to affect project-sample data quality:

- **ZG13006.** There were three EIS recovery failures for sample CACMW-003-160-071124. Four results were considered affected by the recovery failures. PFTriA and Perfluorotetradecanoic acid (PFTeA) were qualified 'UJ' as estimated with low bias. 2-N-ethylperfluoro-1-octanesulfonamido-ethanol (EtFOSE) and 2-N-methylperfluoro-1-octanesulfonamido-ethanol (MeFOSE) were qualified 'X' as recommended for rejection due to extremely low recovery. See checklist and Table 1 for details.
- **ZG18020.** There were 15 EIS recovery failures in the initial analysis and reanalysis of samples CACMW-004-110-071224, CACMW-004-160-071224, CACMW-005-160-071224, and CACMW-GW-FD01-071224. A total of 16 results were affected by the recovery failures. Three results were qualified 'UJ' as estimated with low bias. A total of 13 results were qualified 'X' as recommended for rejection due to extremely low recovery. See checklist and Table 1 for details.

Field Duplicates

Field duplicate samples were collected and submitted blind to the laboratory at the required frequency (one per 10 primary samples). RPDs between field-duplicate results were calculated; where analytes were not detected, the LOD was used in the calculation. RPDs were compared to a MQO of 30% for water.

There were no field duplicate RPD failures considered to affect project-sample data quality.

Equipment and Field Blanks

Samples CACMW-EB02-071524, CACMW-EB03-071624, CACMW-FB02-071524, and CACMW-FB03-071624 were collected as equipment blanks (EB) and field blanks (FB) and submitted with groundwater samples; these EB and FB were conservatively assumed to correspond to all groundwater samples in all SDGs for purposes of data validation. The EBs were used to check for potential cross-contamination of samples from the reusable sampling equipment. The FBs were used to check for potential cross-contamination of samples from sample handling processes. Where analytes were detected in the blanks, corresponding project-sample results were compared to the blank concentration and were considered potentially affected if detected within 5 times the blank concentration in groundwater samples. Professional judgement was used to determine if data quality was affected for individual results, depending upon relative collection times and concentrations of associated samples. Affected results above the LOD are qualified with 'J+' flags indicating the results are estimated with a high bias and results below the LOD were qualified with 'UB' flags as false-positives and are considered non-detect up to the LOD.

The following EB and FB detections were considered to affect project-sample data quality:

- **L1758446**. Calcium, chloride, and fluoride were detected in one or more EB or FB. All fluoride results in SDGs L1756419, L1758081, and L1758446 were considered affected; see checklist and Table 1 for details.

- **ZG19005**. Five PFAS analytes were detected in CACMW-EB03-071624 and three PFAS analytes were detected in CACME-FB04-071624. Perfluorooctane sulfonamide (FOSA) results in samples CACMW-007-160-071524, CACMW-008-160-071624, and CACMW-GW-FD01-071224 were considered affected; see checklist and Table 1 for details.

Other QC Anomalies

The laboratory reported the following QC failures that were considered to affect project-sample data quality:

- **ZG18020**. The laboratory qualified PFOS results in both the initial and reanalysis of sample CACMW-004-110-071224 as having exceeded the calibration range. Affected results are qualified 'J' as estimated for exceeding the calibration range.

Stage 2B Data Validation

The following sections summarize findings of a Stage 2B data validation of the PFAS dataset, which includes review of instrument-level QC information. Only failures affecting project-sample data quality are discussed here; for more information, refer to the attached Stage 2B data validation checklists.

Additional Stage 2A 1633 PFAS Checks

Additional Stage 2A checks are included in the Stage 2B data validation as they are method-specific and are not covered by the standard ADEC Laboratory Data Review Checklist. For LC-MS/MS Methods, additional Stage 2A checks include ion rations, non-extracted internal standards (NIS), LCS and low-level laboratory control samples (LLCS), bile salt interference, and qualitative identification standards compared to method or QSM criteria.

The following anomalies were determined to affect project-sample data quality:

- **ZG13006**. Perfluoroundecanoic acid (PFUnA) in sample CACMW-004-060-071124 and FOSA in the initial analysis of sample CACMW-003-160-071124 had ion ratios outside laboratory limits. Affected results were qualified 'J' as estimated; see checklist and Table 1 for details.
- **ZG18020**. PFUnA in the reanalysis of sample CACMW-004-110-071224 and perfluorononanoic acid (PFNA) and FOSA in the reanalysis of sample CACMW-GW-FD01-071224 had ion ratios outside laboratory limits. Affected results were qualified 'J' as estimated; see checklist and Table 1 for details.
- **ZG19005**. Perfluorodecanoic acid (PFDA) in samples CACMW-008-060-071624 and CACMW-GW-FD02-071624, N-methyl perfluorooctanesulfonamidoacetic acid (NMeFOSAA) in samples CACMW-006-160-071524 and CACMW-008-160-071624, and FOSA in sample CACMW-007-160-071524 had ion ratios outside laboratory limits. Affected results were qualified 'J' as estimated; see checklist and Table 1 for details.

Tuning & Instrument Performance

For LC-MS/MS methods, MS tune checks were evaluated against method-specific criteria. Instrument performance checks, such as mass calibration and mass peak, were reviewed where reported and compared to method or QSM criteria. There were no tuning or instrument performance anomalies affecting project-sample data quality.

Initial Calibration and Verification

The initial calibration for each analysis was reviewed, to check for compliance with method and/or QSM requirements. This included checking that an appropriate number of standards (calibration points) were used, the frequency of calibrations met method and/or project-specific QC requirements, and that the calibration curve met method requirements (e.g. an $r^2 \geq 0.99$). Initial calibrations were acceptable for each analysis.

ICV samples were verified to be from a second source and were reviewed to verify the accuracy of the initial calibration. ICV recoveries were within control limits for each calibration.

Continuing Calibration Verification and Instrument Sensitivity Check

Laboratory batch summaries and/or run logs were reviewed to check that all project samples were bracketed by CCVs, and that CCV percent recoveries were within control limits for target analytes. CCV analysis frequency and percent recoveries were acceptable.

The laboratory analyzed and reported instrument sensitivity checks (ISCs) to check instrument detection capabilities at the required reporting limits. Laboratory batch summaries and/or run logs were reviewed to check that an ISC was performed at least once daily prior to sample and analysis, and that ISC percent recoveries were within control limits. ISC performance and percent recoveries were acceptable.

Instrument Blanks

Laboratory batch summaries and/or run logs were reviewed to check that instrument blanks (IBs) were performed immediately following the highest standard analyzed, daily prior to analyzing standards, after each CCV, and immediately following samples with PFAS concentrations exceeding the quantitation range. Each IB analysis was reviewed to check that IB target analyte concentrations were below one half of the LOQ. IB performance and target analyte concentrations were acceptable.

Stage 3 and 4 Data Validation

The following sections summarize findings of the 10% Stage 3 and Stage 4 data validation, which includes recalculation of select results (Stage 3) and qualitative review of analyte identification and quantitation (Stage 4).

A random selection of 10% of project field samples per SDG were selected for recalculation. All instrument QC samples related to field sample analysis were recalculated. Associated preparatory-batch QC samples (MB, LCS/LCSD, MS/MSD) were recalculated. Only target analytes that were detected in one or more field samples were recalculated. For all selected samples, EIS recoveries were recalculated and compared to reported recoveries. Standards traceability was also reviewed.

For Stage 4 validation, target compound identification and manual integrations were reviewed as described below; there were no tentatively identified compounds reported for this project.

Instrument Calibration, Performance, and Instrument QC Samples

Initial calibrations were recalculated using raw instrument responses from the quantitation reports for calibration standards. The laboratory used an average response factor (RF) calibration for all methods and analytes. Concentrations were calculated based on associated internal standards.

Initial calibration verification (ICV) and bracketing CCV percent recoveries were recalculated and verified against reported recoveries. As noted in the relevant Stage 2B section above, CCV recovery failures did not affect project-sample data quality. ICB and CCBs were recalculated and verified below one-half the LOQ.

Field Samples and Field/Lab QC Samples

A random selection of 10% of field samples for each SDG were selected for Stage 3 recalculation; see Table 2 for a list of selected samples. For the selected field samples, all detected target analyte results were recalculated and compared to the reported results. Additionally, all EIS recoveries were recalculated and verified against reported percent recoveries.

At least one MB, LCS/LCSD, and MS/MSD per method and SDG were recalculated. When detections were reported in an associated blank (MB, FB, or EB), the sample was selected for recalculation. Overall, recalculated results matched reported results, with occasional slight differences likely due to rounding. For recalculations, no rounding was performed until the very end; the laboratory may have rounded intermediate values, accounting for the slight differences.

No anomalies were identified during recalculation of project field sample and field and lab QC sample results that could not be attributed to rounding differences.

Standards Traceability

Laboratory reports were reviewed to verify the certificates of analysis were included for all stock standard solutions, and that the standards used in the ICV were from a secondary source. Standards preparation logs were

reviewed to check that stock standards were diluted properly into working standards for the ICAL and spiking solutions. Standards preparation logs appeared complete and there were no anomalies identified.

Target Compound Identification

Target compound identification was evaluated by qualitatively reviewing signal to noise ratios and relative retention times for target analyte peaks, and presence of valid spectra with passing mass/ion ratios (for MS methods). This evaluation was performed for roughly 10% of positive detections within the randomly selected samples; no anomalies were identified.

Manual Integrations

Manual integrations were noted in the case narratives and with "M" flags on associated results. There was an unusually high frequency of manual integrations in both work orders, for laboratory instrument QC samples, batch QC samples, and field samples, including nearly all detections in field samples. In each case, the justification listed was "incorrect auto integration." A representative selection of manual integrations was reviewed, comparing the chromatograms before and after manual integration. In general, manual integrations were consistently performed across all field and QC samples and appeared appropriate. However, justification for manual integrations could have been more descriptive (e.g. base-line correction, split peak, etc.).

Summary of Data Quality Indicators

The following sections summarize the findings of the above review with respect to the six data quality indicators: sensitivity, precision, accuracy, representativeness, comparability, and completeness.

Sensitivity

Sensitivity describes the ability of the sampling and analytical methodology to meet detection and/or quantitation limit objectives. Analytical sensitivity was evaluated by checking that LODs for non-detect results were below relevant PSLs. A non-detect result is considered to be adequately sensitive if the LOD is below the PSL.

LODs for cadmium, mercury, and HFPO-DA were above the PSL for all samples. However, LOD goals from the UFP-QAPP were met. Overall analytical sensitivity is deemed acceptable for the purposes of this project.

Precision

Precision is a measure of the reproducibility of repetitive measurements. Precision was evaluated based on laboratory QC-sample RPDs and field-duplicate RPDs. No sample results were affected by MSD or field duplicate RPD failures. Overall precision is deemed acceptable for the purposes of this project.

Accuracy

Accuracy is a measure of the correctness, or the closeness, between the true value and the quantity detected. Accuracy was evaluated based on target-analyte recoveries for laboratory batch-level and instrument-level QC samples, and surrogate recoveries for project samples. Accuracy also may be affected by sample contamination identified in blank samples, or by sample handling, preservation, or holding time anomalies.

Five results were affected by LCS/LCSD recovery failures. A total of 20 results were affected by EIS recovery failures. Eight results were affected by MS/MSD recovery failures. A total of 30 results were affected by sample contamination identified in blank samples (MB, FB, and/or EB). A total of 200 PFAS results were affected by a holding time exceedance. Two results were affected by calibration exceedances. Ten results were affected by ion ratio failures. Impact to data usability was generally minor, with the exception of 17 results that were recommended for rejection ('X'-flagged) due to extremely low MS/MSD or EIS recovery. Target analyte and/or EIS recoveries for laboratory QC samples and select field samples were verified through Stage 3 recalculations, with no significant discrepancies identified that would impact project-sample data quality. Overall accuracy is deemed acceptable for the purposes of this project, with exceptions noted above.

Representativeness

Representativeness describes the degree to which data accurately and precisely represent site characteristics. Representativeness is affected by factors such as sample frequency and matrix or contaminant heterogeneity, as well as analytical performance (including sensitivity, accuracy, and precision), sample preservation, handling, and holding times, and sample cross-contamination.

Samples were collected in accordance with an approved work plan, and MQOs defined in the UFP-QAPP were generally met. Sensitivity, precision, and accuracy were acceptable for the purposes of this project. Results qualified due to QC anomalies affecting precision and accuracy are usable as qualified but are not wholly representative of site conditions. Overall, results were considered adequately representative of environmental conditions for the purposes of this project.

Comparability

Comparability describes whether two data sets can be considered equivalent with respect to project goals. Comparability is affected by factors such as sampling methodology and analytical performance (including sensitivity, accuracy, and precision). Comparability was evaluated by checking that standard analytical methods were employed, and analytical performance was acceptable.

Data review findings generally support that the dataset is comparable. Overall comparability should be evaluated by the project team considering sample collection methodology and historic results alongside data quality and analytical methodology.

Completeness

Completeness describes the amount of valid data obtained from the sampling event(s). It is calculated as the percentage of usable measurements compared to the total number of measurements. A total of 17 results were recommended for rejection in this review. The dataset is 99.1% complete. Overall completeness should be reviewed by the project team during data usability assessment. Data usability assessment should include determining whether the 17 results recommended for rejection during data validation are indeed unusable for the purposes of this project. If so, the 'X' flags and results should be replaced with 'R' flags for final reporting.

Conclusions

Sensitivity, precision, accuracy, representativeness, comparability, and completeness were deemed acceptable, and the data are usable for the purposes of this project. Stage 3/4 validation confirmed target analytes were appropriately identified and quantitated and that results were appropriately calculated. A total of 260 results were qualified due to QC anomalies, and 17 results were recommended for rejection. Qualified results are listed in Table 1.

Limitations

This review was based solely on information provided by the analytical laboratory in the laboratory reports and staged electronic data deliverables for the SDGs reviewed. A data quality assessment reduces the risk of reliance on data of compromised quality; however, it does not eliminate that risk.

Definitions:

ng/l	nanograms per liter
SDG	sample delivery group
CAS	Chemical Abstract Service registry number
DL	detection limit
LOD	limit of detection
LOQ	limit of quantitiation
QC	quality control

Notes:

FB	Field or equipment blank detection
Ion_ratio	Ion ratio failure
LCS %R	Laboratory control sample percent recovery failure
Cal Exceed	Instrument calibration range was exceeded
HT	Analyzed outside of holding time
Low EIS %R	Extracted internal standard percent recovery below lower control limit
MS %R	Matrix spike sample percent recovery failure
R<10%	Percent recovery less than 10 percent

Flags:

J-	The result is estimated with a low bias.
J+	The result is estimated with a high bias.
J	The result is estimated with an unknown bias.
UJ	Not detected and reported less than limit of detection, estimated.
M	The manual integration laboratory qualifier has been preserved with the data as informational data for the end user; there was no impact on the data usability.

Lab Flags:

B	Detected in the method blank
H	Out of holding time
J	Estimated result < LOQ and > DL
M	Manual integration
Q	Surrogate failure
S	MS/MSD failure
U	Not detected at or above the LOD

Key

	from quantitation report
	from reported calibration
	from lab report/EDD
	calculated value/comparison

%R	percent recovery
Avg	average
Calc.	calculated
CAS	Chemical Abstract Service registry number
CF	concentration factor
Conc.	concentration
EIS	extracted internal standard
IS	internal standard
ND	not detected
ng/L	nanograms per liter
RF	response factor

Table 4b – Recalculation Summary: ZG18020 Instrument QC Samples

Key

from quantitation report
from reported calibration
from lab report/SEDD
calculated value/comparison

%R	percent recovery
Avg	average
Calc.	calculated
CAS	Chemical Abstract Service registry number
Conc.	concentration
EIS	extracted internal standard
IS	internal standard
mL	milliliters
ND	not detected
ng/L	nanograms per liter
On Col.	on column
RF	response factor
RPD	relative percent difference
