

Sources of Data on Subsistence Harvests of Fish and Wildlife in Alaska

James A. Fall

Marylynne L. Kostick

Division of Subsistence, ADF&G

Human Health Criteria

Public Workshop

Anchorage, AK

October 30, 2015

Meal of salmon, salmonberries, and rice,
Sleetmute, Alaska

Division of Subsistence: Statutory Duties

- Alaska Statute 16.05.094 lists “duties”
 1. Research and data compilation
 2. Data reporting and education
 3. Application of study findings

Subsistence fishing and processing,
Chignik Lake

Types of research projects

- Goal: “holistic” understanding of mixed economy and way of life
 - Community “baseline” studies (focus on one year)
 - Special topic research
 - Local and Traditional Knowledge
 - Harvest monitoring (multi-year)
-
- Most projects are partnerships
 - Guided by ethical principles

Methods: Introducing a project in Togiak

Methods: Local assistant orientation in Noatak

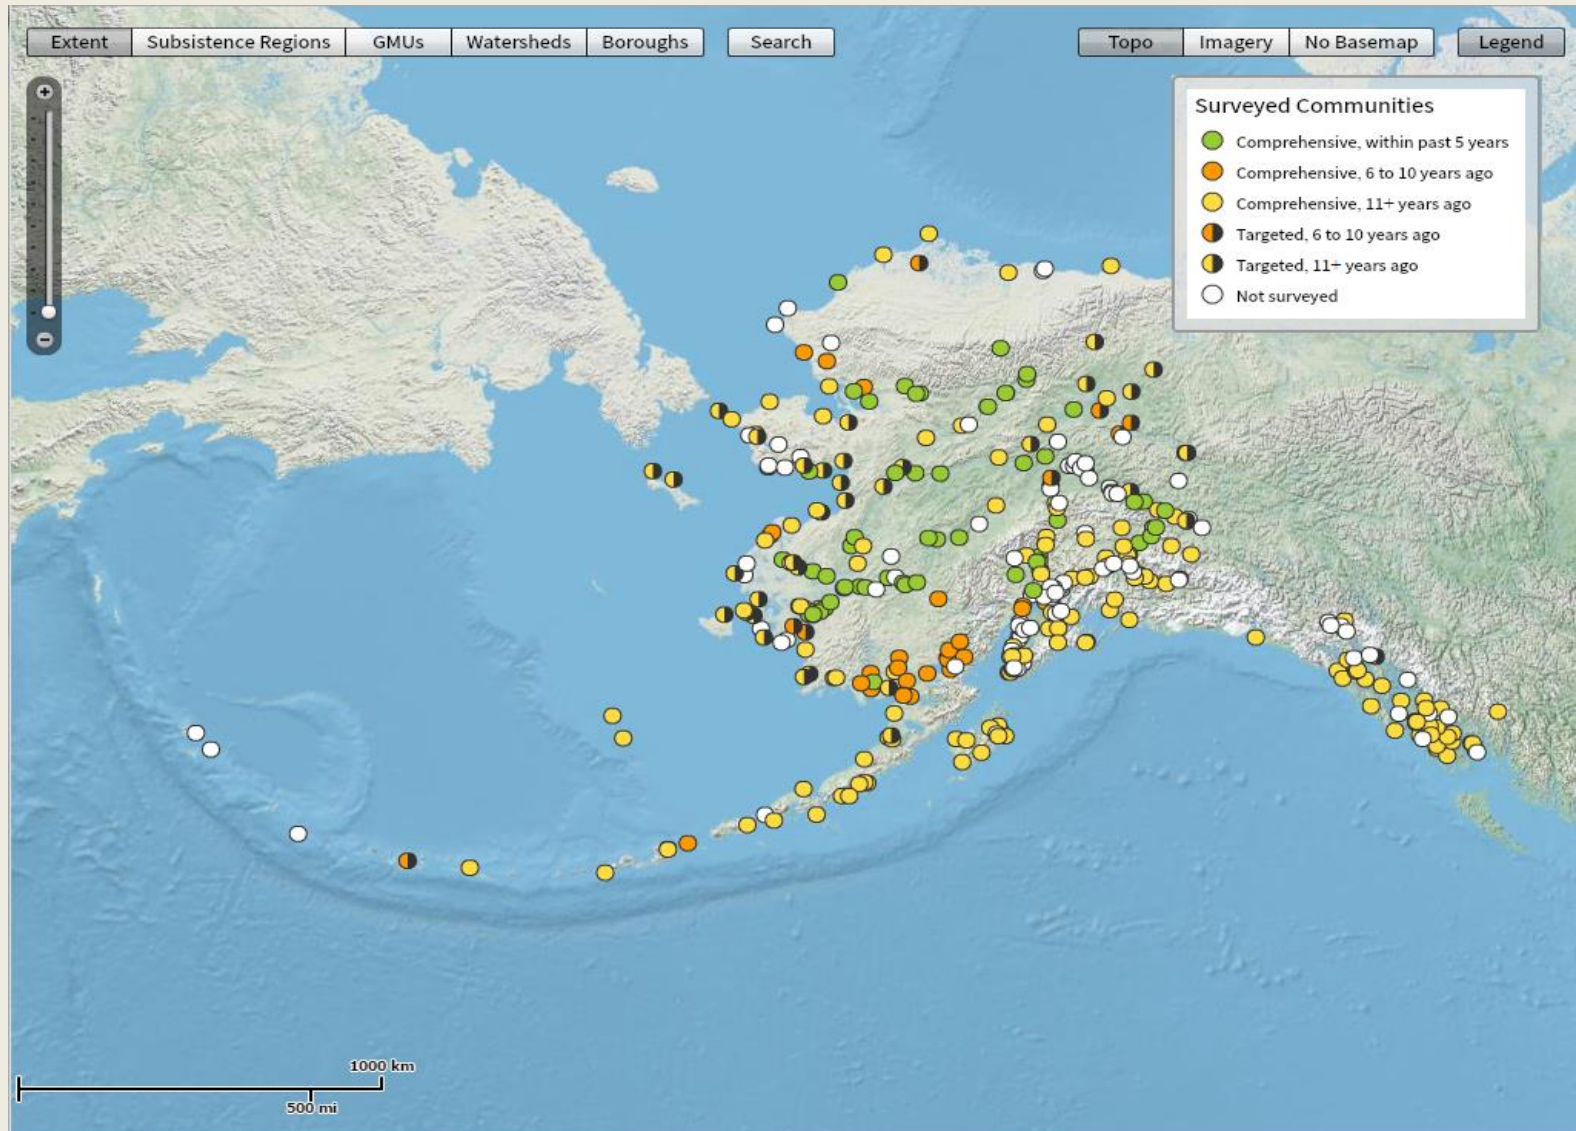

Methods: Administration of survey in Emmonak

Community Subsistence Information System or “CSIS”

- Online at <http://www.adfg.alaska.gov/sb/CSIS/>
- Searchable by resource, area, or community
- Export data into Excel file
- U.S. Census: 355 named communities in Alaska
- 86 in nonsubsistence areas, 269 in “rural” areas
- Of 263 rural places with a population and not a military base or industrial area, data in CSIS for 197 places (75%); 225+ total Alaska places
- Number of data sets in CSIS = ~440 (community/year combinations)

CSIS: Interactive map

Wild food harvests in Alaska by area, 2012 (pounds usable weight per person per year)

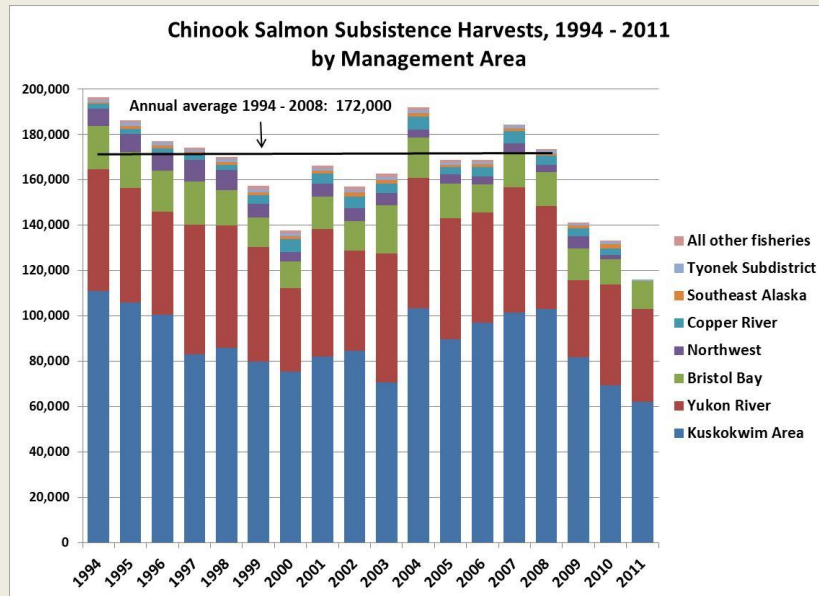

Composition of wild food harvest by rural Alaska residents, 2012

Per Capita Harvests of Wild Resources by Category and Area, 2012

Annual harvest monitoring programs

- Permit systems or post-season surveys
- Most subsistence and personal use salmon fisheries
- Few other subsistence fisheries
- Database (salmon)
- Annual report (salmon)

Consumption Rate Estimates

1. Mean Per Capita Harvest
2. Mean Per Capita Use
 - 95th Percentile Use (High-end User)

Figure 5-2.—Estimated per capita harvest in edible pounds, 15 northwest Alaska communities, 1982–2012.

Table 3-3.—Estimated harvest and use of salmon and nonsalmon fish, Shungnak, 2012.

	Percentage of households					Estimated pounds harvested		Total estimated amount ^a harvested by community		
	Using	Assuming harvest	Harvesting	Receiving	Giving away	Total for community	Mean per household	Mean per capita	95% conf. limit	
Fish										
Salmon										
Chum salmon	78.3%	39.1%	37.0%	65.2%	30.4%	14,747.4 lb	213.7 lb	53.7 lb	2,595.0 ind	± 34%
Coho salmon	8.7%	4.3%	2.2%	6.5%	4.3%	96.9 lb	1.4 lb	0.4 lb	15.0 ind	± 116%
Chinook salmon	6.5%	2.2%	0.0%	4.3%	4.3%	0.0 lb	0.0 lb	0.0 lb	0.0 ind	± 0%
Pink salmon	4.3%	4.3%	2.2%	0.0%	4.3%	32.7 lb	0.5 lb	0.1 lb	9.0 ind	± 116%
Sockeye salmon	10.9%	4.3%	2.2%	6.5%	8.7%	540.0 lb	7.8 lb	2.0 lb	90.0 ind	± 116%
Unknown salmon	2.2%	0.0%	0.0%	2.2%	2.2%	0.0 lb	0.0 lb	0.0 lb	0.0 ind	± 0%
Subtotal	87.8%	41.3%	39.1%	71.7%	39.1%	15,417.0 lb	223.4 lb	56.2 lb	2,709.0 ind	± 32%
Char										
Dolly Varden	19.6%	19.6%	17.4%	2.2%	6.5%	326.7 lb	4.7 lb	1.2 lb	99.0 ind	± 61%
Lake trout	2.2%	2.2%	2.2%	0.0%	0.0%	6.0 lb	0.1 lb	0.0 lb	1.5 ind	± 116%

Mean Per Capita Harvest

$$\frac{\text{Total Harvest in Community}}{\text{Community Population}} = \text{Mean Per Capita Harvest}$$

Assumes that wild foods are ...

- Equally distributed among and consumed by all residents of a community
- Not exported from or imported into a community
- Consumed equally across each day of the year, when expressed as grams per day

Limitations ...

- Lower/Higher than actual levels
- Not age-specific May not be sensitive to cultural use patterns
- “High-end” consumers underestimated, “low-end” consumers overestimated

Mean Per Capita Use

$$\frac{\text{Community's Mean Per Capita Harvest}}{\text{Percentage of Community's Households Using the Resource}} = \text{Mean Per Capita Use}$$

- More precise measure of mean consumption rates, constructed from both harvest and use information
- Mean per capita use > Mean per capita harvest
- Captures differences among household consumption rates related to cultural food patterns

Mean Per Capita Use

$$\frac{\text{Community's Mean Per Capita Harvest}}{\text{Percentage of Community's Households Using the Resource}} = \text{Mean Per Capita Use}$$

Assumes that wild foods are ...

- Equally distributed among and consumed by all residents of households *that report sharing and using the wild food category*
- Not exported from or imported into a community
- Consumed equally across each day of the year, when expressed as grams per day

Limitations ...

- Lower/Higer than actual levels
- Not age-specific
- “High-end” consumers underestimated, “low-end” consumers overestimated

95th Percentile Per Capita Use

An estimate for “high-end” consumers in a community.

- A way for quantifying the potential exposure levels of the segment of a community's population at greatest health risk.
- Higher than mean per capita use for most resource categories.
- Captures variation in the dietary patterns in the population related to dietary breadth, sharing patterns, and cultural use patterns.
- “Dietary Breadth” is the relative number of different types of wild foods within a resource category consumed by a household. Households using a comparatively larger number of different types of wild foods have a greater dietary breadth.*

95th Percentile Per Capita Use

Group 1

- Households that “harvested and did not give”
- $\text{Harvest by each household} / \text{Household size} = \text{Use level}$

Group 2

- Households that “harvested and gave” + households that “did not harvest and used”
- $\text{Harvest by the group of households} / \text{People in the group of households} = \text{Use level}$

Group 3

- Households that “did not use”
- $\text{Use level} = 0$

Uses of members are rank ordered from the lowest value to the highest value.

The community resident occupying the 95th percentile rank is identified.*

95th Percentile Per Capita Use

Assumptions ...

- Group 1 – Wild food harvested by the household was consumed only by members of that household
- Group 2 – The group of “user” households comprised a distribution network in which wild foods were shared equally among all members of the group
- Wild foods are not exported from or imported into a community
- Wild foods are consumed equally across each day of the year, when expressed as grams per day

Limitations ...

- Not age-specific
- Complexity of calculating the measure, requires access to project databases
 - Standard resource categories are accessible through CSIS
 - Specific groupings of wild foods require further analysis*

Consumption Rate Estimate Comparisons
