

City of Fairbanks
“Fairbanks Stormwater Management Development”

FY02 Grant Award: \$ 125,000 Project Match: \$ 83,333

Description and Purpose: The City of Fairbanks in conjunction with the University of Alaska - Fairbanks will continue developing an accurate map, inventory, and model of the City's storm water drainage system. This comprehensive tool is required fundamentally for a detailed understanding of the system and is a necessary foundation for continued development of a storm water management program. It will facilitate communication within the City and other public and private organizations, particularly in emergency situations such as an oil spill. It will aid eventual

compliance with Phase II NPDES requirements. It will also assist in coordinating concerns regarding the Chena River, a Category I watershed, with the Lower Chena River Watershed Management Strategy Committee, and the Noyes Slough Action Committee.

The work represents the third year of a planned multi-year effort. The multi-year project schedule is necessary because of the limited mapping field season, the limited staff, concurrent model development, and the extent of the mapping effort.

Evaluation of Environmental Benefits:

The City will maintain an evaluation process throughout each project task to insure the project objective is being accomplished as intended. Progress will be monitored for extent of work completed and amount of budget expended. Reporting requirements will provide a check on progress and finances. Submittals will be reviewed for timeliness and content. If quality of work product, scope, budget, or target dates are not being achieved, in-house adjustments or amendments to the work plan will be initiated.

Deliverables for this project include:

Data files, maps, and final report.
