1100 – INTRODUCTION/AUTHORITY

This Arctic and Western Alaska Area Contingency Plan (AWA ACP) represents a coordinated and cooperative effort by government agencies. This document contains information applicable to pollution response within the Western Alaska Captain of the Port (COTP) Zone. The U.S. Coast Guard (USCG) and the Alaska Department of Environmental Conservation (ADEC) have written this Area Contingency Plan jointly. It meets the pollution response contingency planning requirements under the National Contingency Plan (NCP) and the Alaska Regional Contingency Plan (RCP) applicable to the State and Federal government.

Geographic Response Strategies (GRS) are found in [Section 9740](#) of this document and are organized by geographic zone, as defined later in this document. GRS provide response strategies for the protection of selected sensitive areas to aid first responders at an oil spill. The strategies serve as guidance to the federal and state on-scene coordinators during an oil spill in the area covered by the GRS. They can save time during the critical first few hours of an oil spill response by showing responders where sensitive areas are located and where to place oil spill protection resources. The GRS are a valued aid in preplanning for a spill response and can provide excellent guidance during a spill response, but are not mandates for specific action at the time of a spill.

Industry's facility and vessel response/contingency plans provide specific data regarding the Responsible Party's (RP) containment, control and cleanup actions. Local Emergency Response Plans (LERPs, also known as Emergency Operations Plans, or EOPs) provide information regarding resources and emergency actions at the local, community level. The Regional Contingency Plan, Area Contingency Plans, LERPs, and industry plans are all critical elements of the coordinated Federal/State/Local and RP response effort to an oil or hazardous substance discharge/release.

The Figure 1-1 illustrates the interrelationship and integration of local, state and federal planning efforts.

This Area Contingency Plan describes the strategy for a coordinated Federal, State, and local response to a discharge, or substantial threat of discharge of oil and/or a release of a hazardous substance from a vessel or on/offshore facility operating within Alaska's boundaries and surrounding waters (Reference [Section 1200](#) for specific descriptions of these boundaries). This plan addresses responses to an average most probable discharge, a maximum most probable discharge, and a worst-case discharge, including discharges from fire or explosion. Planning for these three scenarios covers the expected range of spills likely to occur in Western Alaska. Hazardous materials response scenarios are also included, where appropriate.

For purposes of this plan, the average most probable discharge is the size of an average spill in the area based on historical data. The maximum most probable discharge is also based on historical spill data, and is the size of the discharge most likely to occur, taking into account: the size of the largest recorded spill, traffic flow through the area, hazard assessment, risk assessment, seasonal considerations, spill histories, and operating records of facilities and vessels in the area. The worst-case discharge for a vessel is a discharge of its entire cargo in adverse weather conditions. The worst-case discharge for an offshore or onshore facility is the largest foreseeable discharge in adverse weather conditions. These scenarios are referenced in [Section 9430](#).

Figure 1-1: Integrated Contingency Planning

Area Committees are spill preparedness and planning bodies made of Federal, State, and Local agency representatives, as well as tribal representatives and stakeholders. Further guidance on Area Committees is located in the Alaska Regional Contingency Plan and [Section 1300](#) of this plan.

This plan shall be used as a framework for response mechanisms to evaluate shortfalls and weaknesses in the response structure before an incident. Consistency reviews should address, at a minimum, the quality and quantity of federal, State, local and industry response equipment within the state, available response personnel, protective strategies, and personnel needs compared to those required.

Further information on government contingency planning requirements and authority can be found within the Alaska Regional Contingency Plan.

1200 – GEOGRAPHIC BOUNDARIES

1210 – Geographic Planning Boundaries

Planning boundaries following the three Captain of the Port zones in Alaska have been delineated for the purposes of developing Area Contingency Plans. Within each of these Captain of the Port Zones there are geographic zones, which assist in geographic specific delineation.

This plan covers the Western Alaska Captain of the Port Zone and the following seven geographic zones along the coastal zone delineation as established by Memorandum of Understanding (MOU) between the Environmental Protection Agency (EPA) and the USCG Seventeenth District. A copy of this MOU can be found in the Regional Contingency Plan. Per the MOU and the National Contingency Plan, the "coastal zone" is defined as "all United States waters subject to the tide and all land surface or land substrata, and ground waters, 1000 yards inland."

Figure 1-2: Alaska Planning Areas

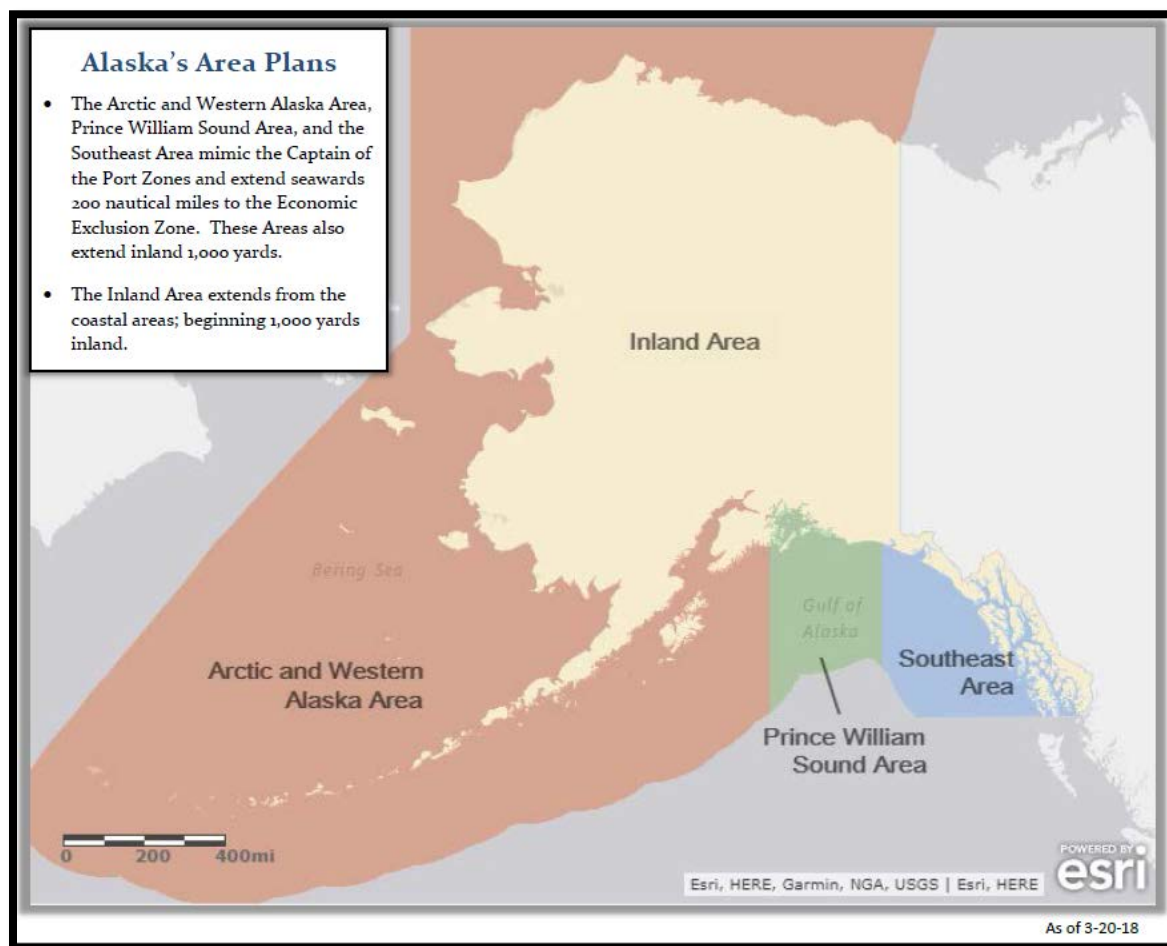

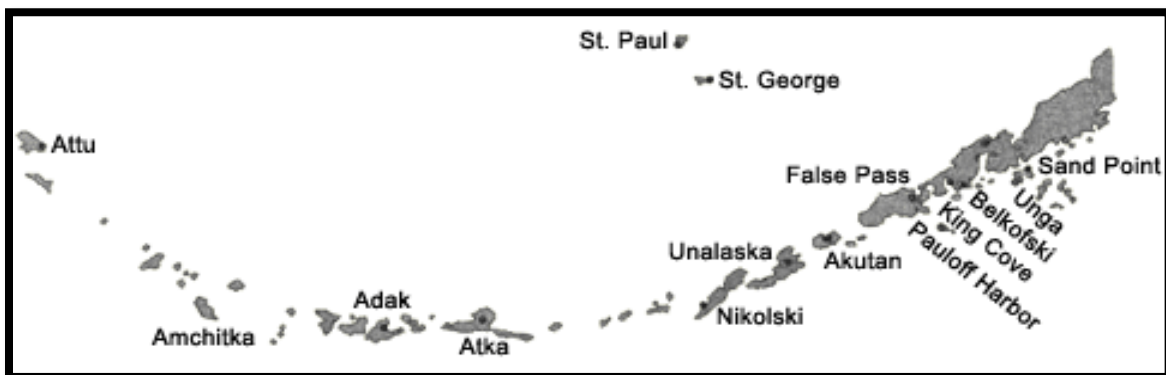

Figure 1-3: Geographic Zones

1210.1 – Aleutian Islands Geographic Zone

The Aleutian Islands Geographic Zone encompasses the boundaries of the Aleutians East Borough, the Aleutians West Coastal Resource Service Area, and the Pribilof Islands, including adjacent shorelines and waters up to 200 nautical miles offshore from the mean low tide coastline. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

Figure 1-4: Aleutian Geographic Zone

The Bristol Bay Geographic Zone encompasses the boundaries of the Bristol Bay Coastal Resource Service Area, the Bristol Bay Borough, and the Lake and Peninsula Borough, including adjacent shorelines and waters up to 200 nautical miles offshore from the mean low tide coastline. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

Bristol Bay, Alaska
Contingency Plan Subarea

1 inch = 50 miles

Approximate 3-Mile Limit

Roads

Print Date: September 06, 1900

Produced by: Alaska Department of Natural Resources

1210.3 – Cook Inlet Geographic Zone

The Cook Inlet Geographic zone encompasses the boundaries of the Kenai Peninsula Borough, the Municipality of Anchorage, and the Matanuska-Susitna Borough, including adjacent shorelines and waters up to 200 nautical miles offshore from the mean low tide coastline. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

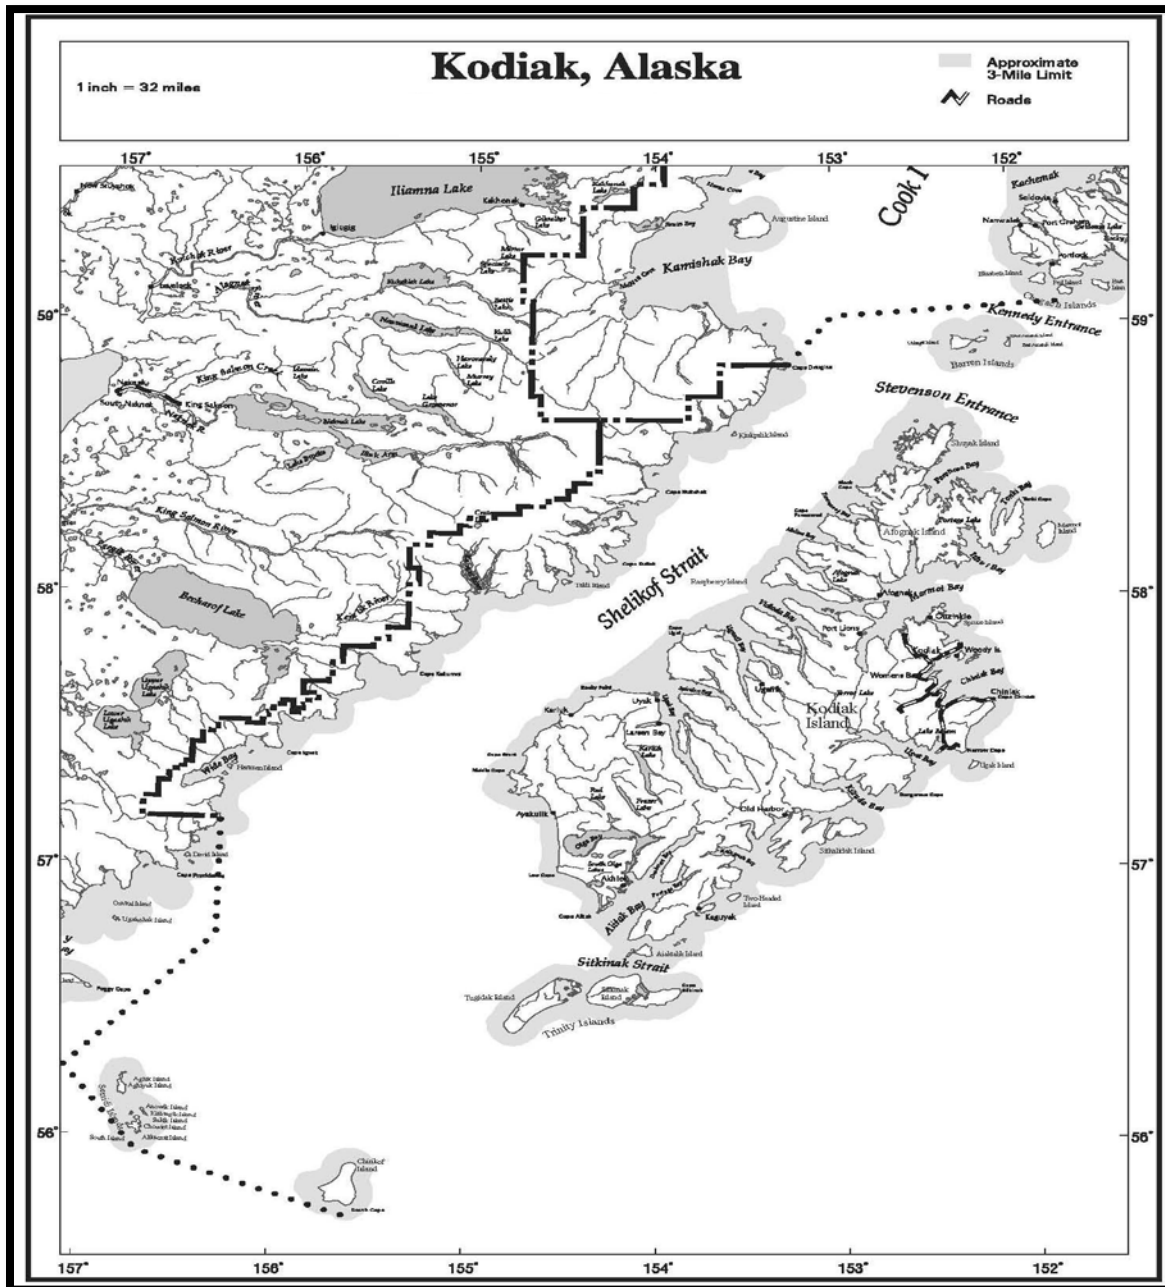

Figure 1-6: Cook Inlet Geographic Zone

1210.4 – Kodiak Island Geographic Zone

The Kodiak Geographic Zone corresponds with the Kodiak Island Borough boundaries and encompasses the Kodiak Island archipelago, extending from the Barren Islands at the north to Chirikof Island and the Semidi Island group at the south, and the coastal area watershed draining to the Shelikof Strait on the south side of the Alaska Peninsula from Cape Kilokak to Cape Douglas. The Kodiak archipelago and west side of Shelikof Strait within the Kodiak Island Borough is approximately 100 miles wide and 250 miles long. It includes more than 5,000 square miles of land, no point of which is more than 15 miles from the sea. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

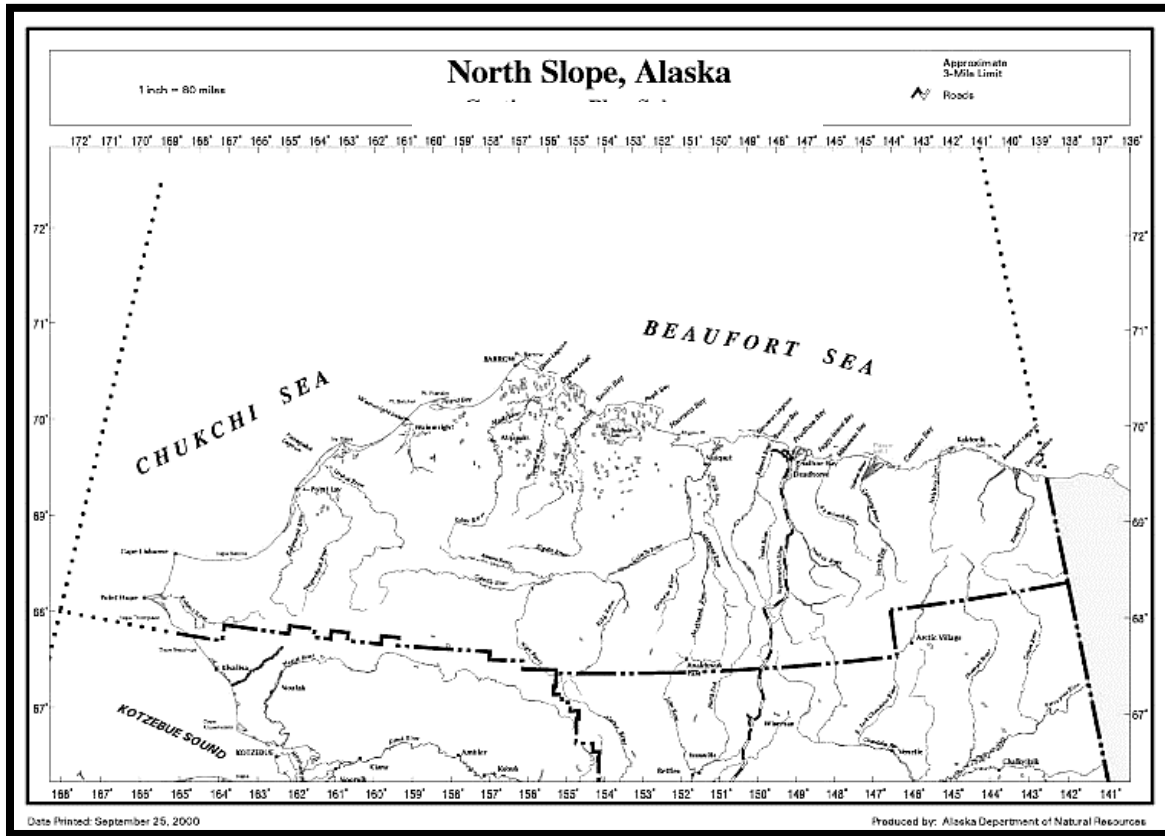

Figure 1-7: Kodiak Island Geographic Zone

1210.5 – North Slope Geographic Zone

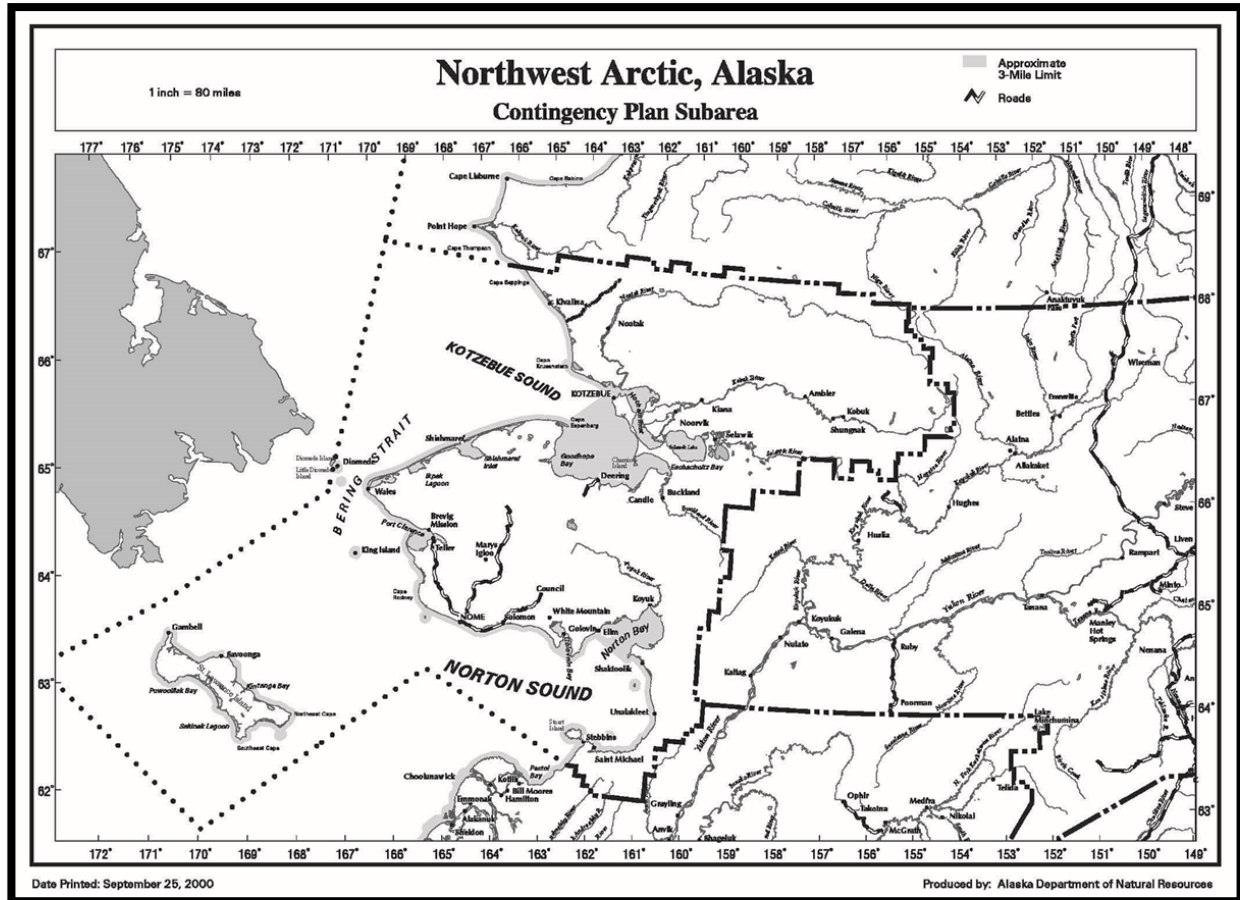

The North Slope Geographic zone encompasses the boundaries of the North Slope Borough, including adjacent shorelines and waters up to 200 nautical miles offshore from the mean low tide coastline. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

Figure 1-8: North Slope Geographic Annex

The Northwest Arctic Geographic zone encompasses the Northwest Arctic Borough and the Bering Straits Regional Corporation, including adjacent shorelines and waters up to 200 nautical miles offshore from the mean low tide coastline. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

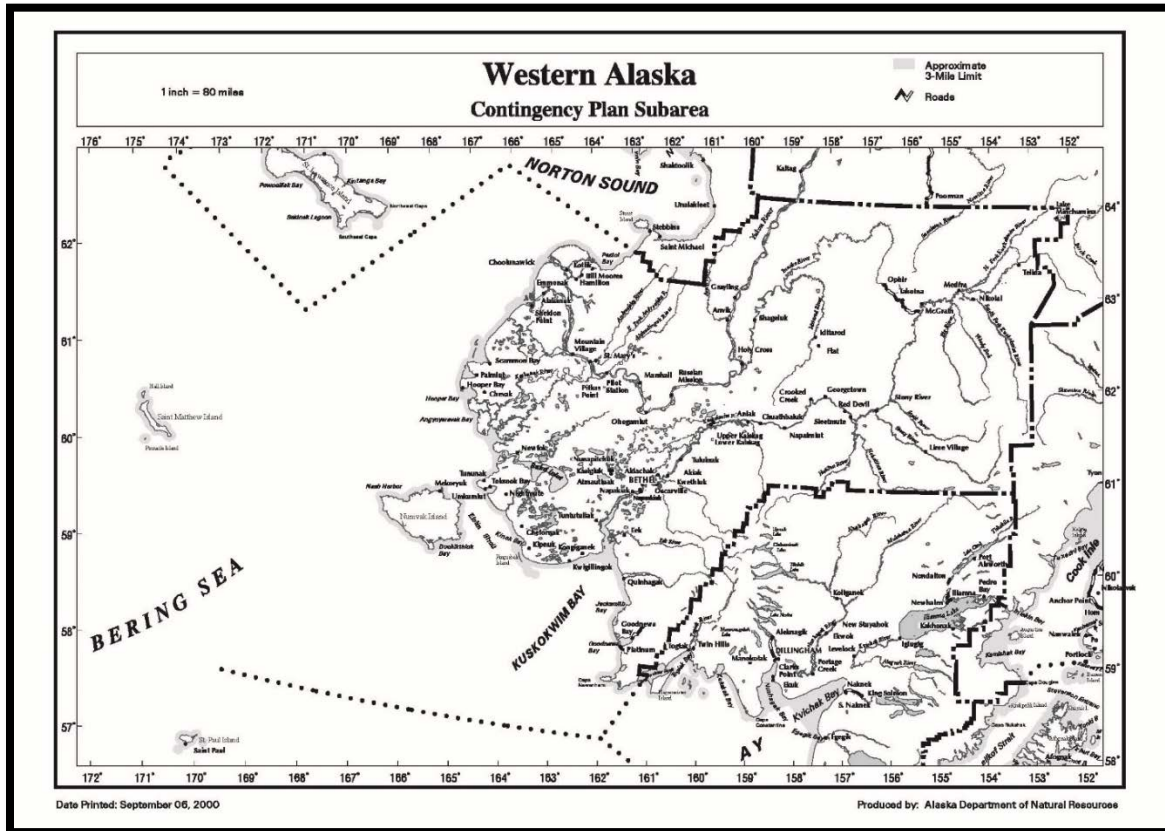

Figure 1-9: Northwest Arctic Geographic Zone

1210.7 – Western Alaska Geographic Zone

The Western Alaska Geographic zone lies north of the Bristol Bay Geographic zone and south of the Bering Straits Regional Corporation, Iditarod, and Kuspuk Regional Educational Attendance Areas, including adjacent shorelines and waters up to 200 nautical miles offshore from the mean low tide coastline. For more details on this Geographic Zone, reference [Section 9730](#) of this document.

Figure 1-10: Western Alaska Geographic Zone

1220 – Geographic Response Boundaries

Response boundaries delineate areas of responsibility for Federal and State On-Scene Coordinators (FOSCs and SOSCs). FOSC jurisdictions are determined by the location of the incident (offshore or coastal). Likewise, SOSC jurisdictions are determined by the incident location: Northern, Central, and Southeast response areas.

1220.1 – Federal On-Scene Coordinator Boundaries

An existing MOU between the USCG Seventeenth District and EPA formally establishes the emergency response boundaries for USCG and EPA FOSCs. A copy of this MOU can be found in the Regional Contingency Plan. Per the MOU and the National Contingency Plan, the "coastal zone" is defined as "all United States waters subject to the tide and all land surface or land substrata, and ground waters, 1000 yards inland."

Coastal Zone FOSC Boundaries:

Captain of the Port (COTP) Southeast Alaska (Commander, Sector Juneau, Alaska) is the pre-designated FOSC for the coastal waters of Southeastern Alaska. This area is southeast of a straight boundary line, which starts at 60° 1.3" North latitude, 142° West longitude, and thence proceeds northeasterly to its end at the international boundary between the United States and Canada at 60° 18.7" North latitude, 141° West longitude.

COTP Prince William Sound (Commander, Marine Safety Unit (MSU), Valdez, Alaska) is the pre-designated FOSC for the coastal waters of Southcentral Alaska. This area falls within the following boundary line: a line which starts at Cape Puget; thence northerly to a latitude 61° 30" North, longitude 148° 26" West; thence easterly to the international boundary between the United States and Canada; thence southerly along the international boundary to latitude 60° 18.7" North, thence southwesterly to the sea at latitude 60° 1.3" North, longitude 142° West, including those islands of the State of Alaska south of the described area located between longitudes 142° West and 148° 26" West.

A MOU exists between the DOI Alaska Pipeline Office and the Department of Homeland Security (Seventeenth USCG District). The MOU provides the specific delineation between Inland and Coastal Waters along the northern and southern portions of the Trans Alaska Pipeline System. A copy of this MOU can be found in the Regional Contingency Plan.

COTP Western Alaska (Commander, Sector Anchorage, Alaska) is the pre-designated FOSC for the coastal waters of Alaska, except those sections of Alaska covered by COTP Southeast Alaska and COTP Prince William Sound.

Offshore Facility FOSC:

The pre-designated FOSC for all spills from offshore facilities is the Captain of the Port for the area in which the facilities are located. Although the FOSC is provided by the USCG, the DOI, Bureau of Safety and Environmental Enforcement (BSEE), retains the following authorities:

The Department of the Interior, Bureau of Safety and Environmental Enforcement (BSEE), Oil Spill Preparedness Division's (OSPD) legal authorities and required operational capabilities for oil spill response for facilities located seaward of the coast line originate from 30 CFR §254. BSEE is one of the legacy agencies, birthed from the reorganization of the Minerals Management Service, founded to focus on offshore oil and gas activities. In addition to 30 CFR §254, there is required connectivity from BSEE to the National Response System (NRS), specifically 40 CFR §300.175(a):

"During preparedness planning or in an actual response, various federal agencies may be called upon to provide assistance in their respective areas of expertise...consistent with agency legal authorities and capabilities."

The NRS identifies the BSEE's legal authorities and capabilities within 40 CFR §300.175(b)(9)(v):

"Minerals Management Service [BSEE]: Oversight of offshore oil and gas exploration and production facilities under the Outer Continental Shelf Lands Act and the CWA; oil spill response technology research; and establishing oil discharge contingency planning requirements for offshore facilities."

The BSEE has primary review and approval authority for oil spill contingency plans submitted for Outer Continental Shelf activities and has review and approval authority for oil spill contingency plans for offshore activities on State of Alaska submerged lands. During an incident response and in alignment with 40 CFR §300.175(a), BSEE may be expected to staff various positions within the Incident Management Team Command and General Staff, particularly for incidents with a nexus to oil well control. The Minerals Management Service (Now BSEE) and ADEC previously signed a Letter of Agreement for the purpose of coordinating and implementing oil spill prevention and response preparedness on State of Alaska submerged lands.

Effective in February 1994, an MOU was entered between the DOI, Department of Transportation (DOT), and the EPA regarding the delegation of responsibilities for spill prevention and control, contingency planning, and equipment inspections of oil and gas facilities. (A copy of this MOU is included in the Regional Contingency Plan). The coastline, as defined in the MOU, is "the line of ordinary low water along that portion of the coast which is in direct contact with the open sea and the line marking the seaward limit of inland waters." This MOU gives EPA responsibility for non-transportation-related offshore facilities located landward of the coastline. DOT has responsibility for transportation-related facilities, including pipelines, located landward of the coastline. In addition, the USCG has the responsibility for deep-water ports and associated seaward pipelines. This MOU gives DOI (Minerals Management Service) responsibility for facilities, including associated pipelines, located seaward of the coastline.

More details on the BSEE Oil Spill Preparedness Division can be found at the following link: <https://www.bsee.gov/sites/bsee.gov/files/bsee-sop-approved-2017-edition.pdf>

FOSC for DOD and DOE Facilities:

Per the National Contingency Plan, the Department of Defense (DOD) and the Department of Energy (DOE) shall provide FOSCs who will be responsible for taking all response actions to releases of hazardous substances, pollutants, or contaminants when the release is on, or the sole source of the release is from, any facility or vessel (including bareboat-chartered and operated vessels) under their jurisdiction, custody or control.

1220.2 – State On-Scene Coordinator Boundaries

General: State On-Scene Coordinator (SOSC) response boundaries for the State of Alaska are depicted on the map shown in Figure 1-11. Three area response teams are available for responding to oil and hazardous materials discharges/releases in their geographic area of responsibility. These teams and their areas of responsibility are as follows:

- **Southeast Area Region:** Southeast Alaska Geographic Zone.
- **Central Area Region:** Prince William Sound, Cook Inlet, Kodiak, Bristol Bay, Aleutian Islands, and Western Alaska Geographic Zones.
- **Northern Area Region:** Northwest Arctic, North Slope, Interior, and portions of the Prince William Sound Geographic Zones.

Pre-designated SOSCs: State On-Scene Coordinators have been pre-designated for responses to oil and/or hazardous substance releases within their area of responsibility. SOSC boundaries are shown below.

The Commissioner, Department of Environmental Conservation, may designate the Director of the Spill Prevention and Response Division or another individual to serve as the State On-Scene Coordinator for major incidents (Reference State Response Team, Type 1 Response Capability below).

Types of Incidents and Response Capability: In addition to the pre-designated SOSCs, ADEC maintains trained area response teams to manage minor (Type 4), medium (Type 2-3), and major (Type 1) incidents. These teams and their response capabilities are described below.

Area Response Team - Type 2-4 Response Capability: Area Response Teams are generally ADEC's first responders who respond to releases, or potential releases as part of the initial response to protect people, property, and the environment. Area response teams are trained to identify hazards, take defensive actions to contain the release from a safe distance, keep it from spreading, prevent exposures, and secure the area. The most important functions of area response teams are to make proper notifications and initiate the emergency response sequence, when needed, to deal with Type 2-4 incidents.

Type 4 Incidents are characterized as small incidents that: can be managed with local resources, normally one response individual; involve no casualties or injuries; are limited in volume, generally < 55 gallon oil spills; and have minimal impact.

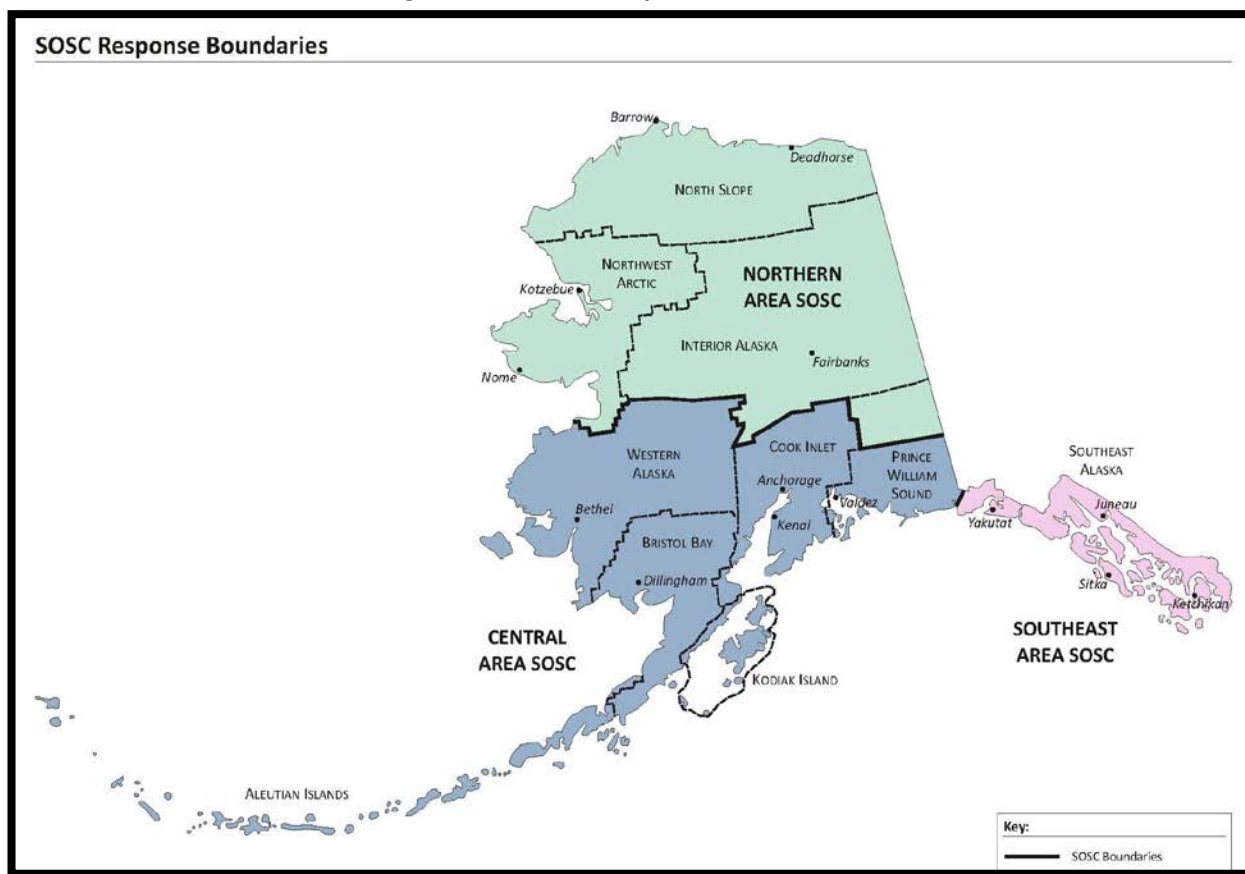

Type 3 Incidents are characterized as regional incidents that: may require activation of other area team resources; require a response staff of 2-10 personnel; involve larger release volumes, generally > 55 gallon oil spills; and have moderate impact potential.

Type 2 Incidents are characterized as statewide incidents requiring activation of other area team resources and more than 10 response staff. They involve significant release volumes, generally >100,000 gallon oil spills, and have moderate impact potential. Type 2 incidents typically result in expenditures greater than \$100,000 and may cover large geographic areas.

Statewide Response Team - Type 1 Response Capability: The Statewide Response Team is activated for large incidents requiring mobilization of statewide resources, participation of other State agencies and involvement of other jurisdictional interests. The Statewide Response Team will be staffed by ADEC's most experienced and senior personnel from the three regional teams.

Type 1 Incidents are characterized as statewide incidents that may involve oil spill volumes in excess of 1,000,000 gallons, require a very large response staff (> 20 personnel), and may result in severe impacts to the environment. Type 1 incidents may result in expenditures greater than \$1,000,000 and cover large geographic areas.

Figure 1-11: SOSC Response Boundaries

1300 – AREA COMMITTEE

The primary role of the Area Committee is to act as a preparedness and planning body for the Captain of the Port/Federal On-Scene Coordinator. The pre-designated FOSC for the USCG and the pre-designated SOSC from ADEC make up Area Committee leadership. They will select work group members and provide general direction and guidance for the work groups and the Subarea Committee. Each member is empowered by their own agency to make decisions on behalf of their organization and to commit the organization to carrying out roles and responsibilities as referenced in this plan.

The Area Committee improves coordination among the national, regional, local planning levels and enhances the availability of trained personnel, necessary equipment, and scientific support needed to address all oil discharges or hazardous substance releases. Area Committees also develop and manage updates to this plan that address planning and response related issues and concerns, including removal of worst-case oil discharges, responsibilities of owners and operators and government agencies in removing oil discharges and/or chemical releases, and procedures for obtaining an expedited decision regarding the use of dispersants. The plan provides detailed information on the geographic area covered by the plan and the response resources available within the FOSC's area of responsibility.

Area Committees are planning bodies, not response entities, although members of the Area Committees may have specific roles during response operations. The area committee should

complement other required planning activities by providing a level of localized site-specific detail unavailable in the National or regional contingency plans. This Area Contingency Plan will be prepared under the direction of the Federal OSC for Sector Anchorage and the State On-Scene Coordinator for Western Alaska and the North Slope/Arctic, who should draw on the expertise of the agencies and entities referenced in the NCP, in addition to state and local resources.

The Arctic and Western Alaska Area Committee is encouraged to solicit advice, guidance or expertise from all appropriate sources, establish subcommittees, and work groups as necessary to accomplish the prepared need and planning task. The FOSC/SOSCs should solicit the advice of the Alaska Regional Response Team to determine appropriate work group representatives from federal, state, and local agencies. This includes tasking the RRTs with providing guidance to Area Committees to ensure inter-area consistency within each region.

1310 – Area Committee Stakeholders, Names, Organization & Contact Information - TBD

1320 – Purpose - TBD

1330 – Organization

Area Committee Members: Please Reference USCG policy on who are able to participate as members and members at large of Area Committees in general. For a list of agencies and participants in the Arctic and Western Alaska Area Committee, Reference documents created by that area committee.

Subcommittees and Workgroups: Area Committee subcommittees seek to solicit advice, guidance or expertise from all appropriate sources and establish permanently standing subcommittees as necessary to accomplish the preparedness and planning tasks. The Area Committee selects members and provides general direction and guidance for any standing subcommittee. In addition to federal, state and local agency representatives, subcommittee participants may include facility owners/operators, shipping company representatives, cleanup contractors, emergency response officials, marine pilot associations, academia, environmental groups, consultants, response organizations and representatives from any applicable regional citizens' advisory councils.

1340 – Charter Members - TBD

1400 – NATIONAL RESPONSE SYSTEM (NRS)

1410 – National Response Structure

Reference the Regional Contingency Plan. Additionally, guidance can be found within the National Contingency Plan, 40 CFR 300.

1410.1 – Spill of National Significance (SONS)

For a Spill of National Significance (SONS) in the coastal zone, the USCG Commandant may name a senior agency official to assist the FOSC in communicating with affected parties and the public and coordinating federal, State, local, and international resources at the national level. This strategic coordination will involve, as appropriate, the National Response Team, Alaska Regional Response Team, the Governor of Alaska, and the mayors or other chief executives of local governments.

Additionally, guidance can be found within the National Contingency Plan, [40 CFR 300.323](#).

1420 – Regional Response Team (RRT) Structure

Reference the Regional Contingency Plan. Additionally, guidance can be found within the National Contingency Plan, [40 CFR 300.115](#).

The Alaska Regional Response Team (ARRT) is a standing body established by the National Contingency Plan (NCP). The ARRT is responsible for recommending changes to the regional response organization as needed, revising the Regional Contingency Plan, as needed, evaluating the preparedness of participating agencies and the effectiveness of Area Contingency Plans for a federal response to discharges and releases, and providing technical assistance for preparedness to the general response community. The ARRT is composed of State and Federal agencies. The Alaska Department of Environmental Conservation provides the State's representative. The alternate State representative is provided by the Alaska Department of Military and Veterans Affairs/ Division of Homeland Security and Emergency Management. The ARRT provides a regional mechanism for the development and coordination of preparedness activities prior to a pollution response.

The ARRT can coordinate assistance and advice to the FOSC, when requested, by providing additional federal and State resources and expediting approvals for federal and State permits. The ARRT is chaired by the agency providing the FOSC (USCG or EPA).

While assigned to ICS sections within the Unified ICS, ARRT members or their representatives are immediately available to work with other agencies that have similar concerns and responsibilities. This enhances the timeliness and thoroughness of decisions. A formal "convening" of the ARRT during a spill event will only be necessary for dispute resolution or major policy issues affecting multiple agencies. During any response requiring State input to the ARRT, the SOSC has been delegated the authority to serve as the State's representative to the ARRT. The SOSC, as the State representative, will consult with other State agencies that have management authorities/responsibilities for resources that might be affected by ARRT decisions. Appropriate ARRT members will convene as necessary to make decisions on *in situ* burning, use of chemical countermeasures, and nationwide permits (404 permits).

1430 – Arctic and Western Alaska (AWA) Area Response Structure

1430.1 – Federal Role in Incident Response

The USCG is the lead agency for coastal oil and hazardous materials spill responses and shall serve as the Federal On-Scene Coordinator in the Unified Command. The role of the USCG in the Unified Command will vary according to spill type and size. The USCG has adopted [The USCG Incident Management Handbook](#) for use in guiding their major spill response efforts. The guide provides detailed guidance for each Incident Command System position identified for emergency response operations.

1430.2 – State Role in Incident Response

The Alaska Department of Environmental Conservation (ADEC) is the lead agency for the State of Alaska in oil and hazardous materials spill response. ADEC serves as the State On-Scene Coordinator (SOSC) in the Unified Command. The Statewide Oil and Hazardous Substance Incident Management System Workgroup (consisting of ADEC, industry, spill cooperatives, and federal agencies) has published [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response](#). The AIMS Guide provides ADEC personnel and other response personnel with detailed guidance for properly responding to a major spill incident.

1430.3 – Local Role in Incident Response

In the event of an oil spill or hazardous substance release, a senior member of the local community with jurisdiction, unless otherwise specified by local plans, will serve as the LOSC in the Unified Command. For all spills in which the ICS is implemented, the LOSC will sit in the Unified Command with the FOSC, SOSC, and RPOSC, sharing decision-making and oversight responsibilities with the other On-Scene Coordinators. For spills that affect or threaten to affect multiple jurisdictions, appropriate officials from the affected communities will integrate into the command structure either through a LOSC liaison representing the affected communities or through a Regional Stakeholder Committee.

As long as there is an immediate threat to public safety, the LOSC will serve as the ultimate command authority if the FOSC or SOSC does not assume the lead role for the response, or the LOSC requests a higher authority to assume that responsibility.

1430.4 – Responsible Party (RP) Policy

Under federal and state law, the RP is responsible to contain, control, and clean up any oil or hazardous substance spilled. The RP must notify the federal, state, and local authorities of the spill incident and initiate an effective response. The RP is expected to respond to an incident using their own resources and securing additional contractual expertise and equipment when necessary. The FOSC and SOSC have the authority to oversee the RP's activities, and both are authorized to take over or supplement the RP's response activities if they determine those activities to be inadequate. During an RP-driven response, if the vessel or facility has a contingency plan under state law (C-plan) or a Vessel Response Plan (VRP) or Facility Response Plan (FRP) under the national planning criteria, it will serve as the primary guidance document for the spill response, and the RP will designate the Incident Commander. (In remote areas where typical response resources are not available, or the available commercial resources do not meet the national planning criteria, the owner or operator of a vessel required to have a VRP may request the USCG accept an Alternative Planning Criteria, established under Title 33 CFR Part 155.) If there is no RP, or if the RP does not have a government-approved contingency plan, the Regional Contingency Plan and this Area Contingency Plan will become the guiding document during the spill response.

1440 – Incident Command System (ICS)

The oil and hazardous substance discharge response Incident Command System (ICS) as referenced in the Regional Contingency Plan will be used during a spill response in the Arctic and Western Alaska Area. In the event of an actual or potential oil or hazardous materials release, an Incident Command System response will be activated. The ICS is based on the National Incident Management System (NIMS), which was developed to coordinate agency action and provide a command structure for use during emergency response events. In the State of Alaska, the Unified Command application of the Incident Command System is used for response to oil and hazardous material spills.

The Incident Command System allows federal, state, and local governments to participate in the spill response both in an oversight capacity and as participants in the containment, control, and cleanup of the spill. The ICS is organized around five major functions: Command, Planning, Operations, Logistics and Finance/Administration. The basic ICS structure remains the same in all incidents, but the magnitude and complexity of the spill emergency will dictate which functional areas will be activated and to what level. The ICS can be expanded or contracted to suit the size and scale of the spill.

The Incident Command System is led by a Unified Command, which directs all aspects of incident response (including oversight, monitoring, cleanup, etc.), and includes an Incident Commander (IC), who is in command of the control, containment, removal, and disposal of the spill. The Unified Command is typically comprised of the Federal On-Scene Coordinator (FOSC), the State On-Scene Coordinator (SOSC), the Local

On-Scene Coordinator (LOSC), and the Responsible Party representative (RP). The Unified Command is implemented in situations where more than one agency has jurisdiction. When the RP is identified, the senior representative of the RP joins the Unified Command and is designated the Incident Commander (IC). When there is no RP, or the RP is unable to satisfactorily respond to a spill, the spill response will be directed by an Incident Commander designated by the agency with jurisdictional authority (federal, state, or local.)

Below the command level, positions within the ICS can be filled by employees of the RP (recommended) or its independent contractors. The exact size and composition of an ICS will vary according to the needs of the response and the experience level of the personnel involved. Government agency personnel may supplement ICS staffing as necessary.

By integrating response management early in the response, consensus and mobilization can be more quickly achieved and limited resources combined to reduce duplication of effort and enhance response effectiveness.

1450 – Area Exercise Mechanism

Reference the Alaska Regional Contingency Plan.

1460 – National Response Framework

Reference the following FEMA website for information on the National Response Framework:
<https://www.fema.gov/media-library/assets/documents/32230>

1470 – Federal Radiological Response Plan

Reference the following link to access the Nuclear/Radiological Incident Annex (NRIA) to the National Response Framework document:

https://www.fema.gov/pdf/emergency/nrf/nrf_nuclearradiologicalincidentannex.pdf

1500 – STATE/LOCAL RESPONSE SYSTEM - TBD

1600 – NATIONAL POLICY AND DOCTRINE - TBD

1610 – Public vs. Private Resource Utilization - TBD

1620 – Best Response Concept - TBD

1630 – Cleanup Assessment Protocol

Whether the response is conducted by a RP or the federal government, the FOSC is responsible for determining removal completeness and authorizing termination of operations. When uncertain, the FOSC may seek the advice of the ARRT. Generally, removal of an oil discharge is complete when:

1. There is no longer any detectable oil present on the water, adjoining shorelines, or places where it is likely to reach the water.
2. Further removal operations would cause more environmental harm than the oil to be removed.
3. Cleanup measures would pose a hazard to responders, or would be excessively costly in view of their insignificant contribution to minimizing a threat to the public health or welfare, or the environment; and
4. Activities required to repair unavoidable damage resulting from removal actions have been performed.

1640 – Alternative Response Technologies

1640.1 – Dispersant Pre-Approval/Monitoring/Decision Protocol

Reference Appendix III of the Alaska Regional Contingency Plan for the Oil Dispersant Guidelines for Alaska. Additional technical assistance for dispersant application can be found in the [ADEC STAR Manual](#).

1640.2 – In Situ Burn (ISB) Approval/Monitoring/Decision Protocol

Reference Appendix IV of the Alaska Regional Contingency Plan. Additional technical assistance for dispersant application can be found in the [ADEC STAR Manual](#).

1640.3 – Bioremediation Approval/Monitoring/Decision Protocol – TBD

1640.4 – Alternative Response Technology Evaluation System (ARTES)

Information on the Alternative Response Technology Evaluation System can be found at the NOAA website at the following link:

<https://response.restoration.noaa.gov/oil-and-chemical-spills/oil-spills/resources/alternative-response-tool-evaluation-system-artes.html>. Reference Appendix V of the Alaska Regional Contingency Plan.

1640.5 – Special Monitoring of Applied Response Technology (SMART)

Reference Appendix III of the Alaska Regional Contingency Plan for the Oil Dispersant Guidelines for Alaska to include SMART guidance. Additional technical assistance for dispersant application can be found in the [ADEC STAR Manual](#).

1650 – Fish and Wildlife Acts Compliance

1650.1 - Migratory Bird Treaty Act (MBTA)

For information on the ESA, reference the following U.S. Fish and Wildlife Service website:

<https://www.fws.gov/birds/policies-and-regulations/laws-legislations/migratory-bird-treaty-act.php>

1650.2 - Marine Mammal Protection Act (MMPA)

For information on the ESA, reference the following U.S. Fish and Wildlife Service website:

1650.3 – Endangered Species Act (ESA)

For information on the ESA, reference the following U.S. Fish and Wildlife Service website:

<https://www.fws.gov/endangered/laws-policies/>

1660 – Protection of Historic Properties (National Historic Preservation Act (NHPA))

For information on NHPA, reference the following FEMA website: <https://www.fema.gov/national-historic-preservation-act-1966-amended-2000>

1700 – RESERVED

1800 – RESERVED

1900 – RESERVED FOR AREA/DISTRICT

2100 – UNIFIED COMMAND (UC)

In the State of Alaska, the Unified Command for oil and hazardous substance discharge response consists solely of the On-scene Coordinators (OSC) for the Federal, State and Local governments, plus the Responsible Party's (RP) Incident Commander (IC). Other government agencies are represented by the Federal, State and Local OSCs.

Whenever an incident involves more than one agency with jurisdiction, a Unified Command will be established. A Unified Command will also be established if there is only one agency with jurisdiction and the RP is responding adequately. The RP and all agencies with jurisdictional responsibilities will contribute to the process of:

- Determining Overall Incident Objectives and Priorities;
- Selecting Strategies;
- Ensuring Joint Planning for Tactical Activities;
- Ensuring Integrated Tactical Operations are Conducted;
- Maximizing Use of All Assigned Resources;
- Resolving Conflicts.

The Unified Commanders will:

- Designate the IC (who will normally be one of the Unified Commanders assigned to the Unified Command);
- Designate officers and section chiefs for each section within the ICS;
- Review and approve a consolidated incident action plan; and
- Ensure the incident action plan is carried out by the IC.

The Unified Command directs all aspects of incident response (including oversight, monitoring, resource allocation cleanup, etc.) and uses an IC to carry out containment, control, and cleanup operations.

The IC is in charge of control, containment, removal, and disposal of the spill. There can be only one IC at any given time. However, the IC can change as incidents progress. The IC will be chosen by the Unified Command (FOSC, SOSC, LOSEC, and RPOSC). When the RP is responding and has adequate resources to dedicate to containment, control, and cleanup efforts, the RPOSC will normally be the IC. The FOSC and SOSC make the determination based on the adequacy of the RP's containment, control, and cleanup efforts.

FOSCs and SOSCs will only designate their own IC if the RP is unknown or is not adequately responding to the incident. Typically, one of the OSCs or a response action contractor will become the IC.

Although the USCG, EPA and ADEC are the lead federal and State agencies with broad responsibilities during an oil spill or hazardous substance release, other federal and State agencies have major roles in spill response, which are defined by federal and State statutes. The federal OSC will incorporate all federal agencies with regulatory roles in oil and hazardous substance discharge into a single federal response with a single FOSC in charge. The FOSC is responsible for representing all federal response action concerns.

The State will incorporate all State agencies with regulatory or mandated roles in oil or hazardous substance discharge into a single State response with a single SOSC in charge. Even though the SOSC is from the ADEC, he/she is responsible for representing **all** State concerns.

Every effort will be made to incorporate personnel from participating agencies in specific ICS functional roles within the Planning, Finance/Administration, Operations, Logistics and/or the Command Staff. All participants assigned to the response will work under the direction of the FOSC or SOSC while representing their respective agencies. Any disputes between agency personnel, which cannot be resolved at the response staff level, should be referred to their Agency Representative for resolution at the Command level.

The FOSC is the final arbitrator within the federal response organization. All disputes should be resolved within the response structure, so the federal government can speak with a single consistent voice - the FOSC's. Per the National Contingency Plan, disputes that cannot be resolved within the response structure could be elevated to the Alaska Regional Response Team for resolution, if within their jurisdiction. Disputes that cannot be resolved by the ARRT shall be elevated to the National Response Team.

The SOSC is the final arbitrator within the State's spill response organization. All disputes should be resolved within the response structure so the State can speak with a single, timely, consistent voice - the SOSC's. Disputes that cannot be resolved within the spill response structure should be elevated by the Agency Representative or SOSC to the Disaster Policy Cabinet for resolution at the Commissioner level.

Federal, State and local governments, as well as the RP, may require concurrent activities, which must be performed, yet are not part of containment, control and cleanup operations. Activities such as oversight, monitoring, damage assessment studies and evidence collection for potential litigation must be accomplished concurrently under an independent command structure.

The federal government and State of Alaska have responsibilities that cannot be combined with the RP's cleanup and containment efforts. These responsibilities include:

- 1) Determining the RP;
- 2) Investigating the cause of the discharge;
- 3) Collecting samples;
- 4) Monitoring and determining the adequacy of the RP's response;
- 5) Performing shoreline cleanup and assessment techniques;
- 6) Determining the extent of contamination;
- 7) Monitoring restoration;
- 8) Determining and recovering the state's costs; and
- 9) Assessing penalties.

The OSCs will direct oversight and monitoring functions within the ICS. This will allow OSCs to coordinate monitoring efforts with containment, control, and cleanup and with local government activities. The OSCs may designate Deputy OSCs to assist with this function.

When there is no identified RP, or the RP fails to respond adequately, the federal and/or State government may become responsible for the containment, control and cleanup operation. In these instances, the containment, control and cleanup effort will be carried out by the Operations Section and contract personnel. A possible way to organize the Operations Section would be to divide the Operations Section into two major branches, Response and Oversight.

In this capacity, the FOSC/SOSC may elect to hire a response action contractor to perform containment and cleanup actions. The FOSC/SOSC would assume an oversight role and monitor the contractor's

actions. However, the FOSC/SOSC would also be responsible for certain response actions, such as monitoring/sampling, and investigations.

2110 – Command Representatives

2110.1 – General

Each Federal and State agency that has a role in an oil or hazardous substance response will designate an Agency Representative. An Agency Representative has been delegated full authority to make immediate and pertinent decisions on all matters affecting that agency's involvement with the incident. There will be **only one** Agency Representative assigned to the incident from each responding agency. The Agency Representative will work directly with the FOSC, SOSC, or his/her designee to resolve disputes. For the USCG or EPA, the Agency Representative is the FOSC or the FOSC's designated representative. For ADEC, the Agency Representative will be the SOSC. When no Agency Representative is present or assigned, the FOSC or SOSC will contact the appropriate agency.

Under the National Contingency Plan (NCP) and State statutes, State and Federal Governments are responsible for ensuring responses to oil and hazardous substance incidents are timely and adequate. This responsibility has three aspects:

- Conduct the Government's oversight functions concerning monitoring, investigating, permitting, conducting damage assessments, restoration, and collecting documentation for possible litigation or cost recovery.
- Augment the RP's cleanup efforts, when necessary, to contain the release, recover the product, and minimize the impact to the environment.
- Take over containment, control and cleanup operations when necessary.

Federal and State governments conduct and coordinate these three functions using the Unified ICS. The Federal and State Governments' oversight function only involves government or contracted resources, although it is coordinated with other parties involved in the cleanup effort.

The following are helpful resources for establishing a case specific organization:

- [The USCG Incident Management Handbook](#)
- [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response.](#)

2110.2 – Federal Representative

For federal agencies, the ARRT representative for the incident will serve as the Agency Representative unless otherwise designated.

The Federal On-Scene Coordinator (FOSC) is designated under the National Contingency Plan to direct and coordinate the federal response to incidents under the authority of federal laws and regulations. Federal responsibilities are divided into a Coastal zone and an Inland zone, as defined by an interagency agreement between EPA and the USCG. In the Coastal zone, the Commanding Officers of the USCG Sectors (or Captain of the Ports) are designated as FOSCs for oil discharges and hazardous substance releases. For oil discharges and hazardous substance releases in the Inland zone, the Environmental Protection Agency designates the FOSC. For hazardous substances releases from any facility or vessel under the DOD's or DOE's jurisdiction, the department with jurisdiction designates the FOSC.

2110.3 – State Representative

The commissioners of each supporting State agency shall appoint the Agency Representative for their department.

The State On-Scene Coordinator (SOSC) is responsible for directing and coordinating the State's response to oil and hazardous substance discharges. SOSCs are designated by the Commissioner of the ADEC. SOSCs have been pre-designated for the following response areas: Northern Alaska; Central Alaska; and Southeast Alaska. In the event of a major spill, the Commissioner may designate the Director, Spill Prevention and Response Division or another individual to serve as the SOSC. The SOSC may appoint an on-scene field representative (SOSC Rep) to act for the SOSC during a response. The SOSC Rep can be selectively delegated authority by the SOSC.

2110.4 – Local Representative

Local On-Scene Coordinators (LOSCs) are designated by local governments with jurisdiction to direct and coordinate local responses to incidents. LOSCs are normally part of the Unified Command as long as there is an immediate threat to public safety and/or the incident occurs within their jurisdiction.

Once immediate threats to public safety are abated, either the SOSC or FOSC becomes the ultimate command authority for the cleanup operation, depending on jurisdiction and agency response. Local representation to the Unified Command may then be through the CEC on the Regional Stakeholder Committee.

Community Emergency Coordinators (CECs) are designated in Local Emergency Response Plans and may serve as the LOSC or on the Regional Stakeholder Committee (RSC).

Local Emergency Response Plans (developed by Local Emergency Planning Committees, if established for the jurisdiction) designate Community Emergency Coordinators for responding to oil and hazardous substance releases.

2110.5 – Responsible Party Representative

The Responsible Party's On-Scene Coordinator (RPOSC) will direct and coordinate their resources in response to incidents for which they are responsible. Facility or vessel response or contingency plans designate the RPOSC. If the facility or vessel does not have a response or contingency plan, the RP will designate their OSC.

The Responsible Party (RP) is the person(s) responsible for a discharge of a hazardous substance to the water or land of the State. Under State regulations (18 AAC 75.315), it is the responsibility of the RP to contain, control and clean up their discharge. Similar federal laws require RPs to respond to their spills and oblige the RP to direct its own containment, control and cleanup efforts. Even though the RP is required to respond to a spill, the State On-Scene Coordinator (SOSC) oversees the RP's containment, control and cleanup efforts and has the authority to take over or supplement the response activities if the SOSC determines that the response is inadequate (18 AAC 75.320). The Federal On-Scene Coordinator (FOSC) has similar authority under federal law. Additionally, the Oil Pollution Act of 1990 (OPA 90) authorizes the United States USCG (USCG) to direct the RP's activities without "federalizing" (taking federal control) the spill cleanup efforts.

The RPs may use contracted resources, which may include Oil Spill Response Organizations (OSROs), Incident Management Teams (IMTs), and Non-Tank Vessel Cleanup Contractors (NTVCCs), to assist the RP

or to act on their behalf during the incident responses. These entities may fill ICS positions, or work in the field to facilitate cleanup efforts.

2110.6 – Area Command

An Area Command Authority (ACA) will be established during a disaster, such as an earthquake, when the State is faced with multiple oil and hazardous material spills. The ACA will assume overall command and coordination of the various spill incidents only. The SOSC for the affected region will be the ACA. The individual incidents will be under the command of SOSC representatives. The ACA [SOSC] will prioritize the State's responses to the separate incidents. The ACA will coordinate all spill response efforts with the State Coordinating Officer (SCO). The use of an Area Command Authority is also one possible way of managing a single very large spill.

2110.7 – Single Command

When an incident occurs with single jurisdiction and one agency has primary responsibility, the single command structure will be established. For significant oil spills and hazardous substance releases, there will normally be OSCs from the RP, federal and state governments. There may also be a local OSC for incidents posing an immediate threat to public safety and those within their local jurisdiction. When there is not an RP; the RP is unable to respond satisfactorily; or the Federal, State or local government takes over response activities, the OSC will be determined by the agency with jurisdictional authority.

The Unified Command operates with the FOSC having ultimate authority for incidents under federal jurisdiction and the SOSC having ultimate authority for incidents not involving federal jurisdiction. As long as there is an immediate threat to public safety, a Local On-Scene Coordinator (LOSC) will serve as the ultimate command authority if the FOSC or SOSC do not assume the lead role for response, or until the LOSC requests a higher authority to assume that responsibility. The RP retains authority as long as they are adequately responding to the incident (and there is no immediate threat to public health and safety). The Unified Command will respect all governmental agencies' and private jurisdictional authorities. Most of the time, the Unified Command will be able to agree upon a single incident action plan. In cases where there are disputes or differences, the OSC having ultimate authority described above will settle these disputes.

- a) When the federal government is participating, an FOSC will be provided by the USCG, EPA, or Department of Defense (DOD). The USCG will manage spills in the coastal zone; EPA will manage inland spills, and the DOD will provide the FOSC if a hazardous substance release involves military resources and occurs on military facilities.
- b) If there is no federal jurisdiction or the FOSC designates the State to act as the FOSC's representative, the State SOSC is in charge, so federal trustee agencies should contact and coordinate with the SOSC.

2120 – Unified Command Staff

Key positions may be established to assume responsibility for activities that are not part of the line organization. Unified Commanders determine who fills these positions.

- Public Information Officer (PIO) -- point of contact for the media and individuals who desire information about the incident.

- Safety Officer (SOFR) -- assesses hazardous/unsafe situations and develops a safety plan to ensure personnel safety.
- Liaison Officers (LOFR) -- point of contact for affected communities, interest groups that do not have jurisdictional authority, landowners, leaseholders, RCACs, government agencies, and other groups of interested parties. Several Liaison Officers may be designated, depending on the level of coordination required. The LOFR coordinates with the Regional Stakeholder Committee, if one is activated.

2130 – Guidance for setting response objectives

2130.1 – General

Regardless of the nature or location of a spill, the following objectives shall guide all response actions:

1. Ensure safety of responders and the public.
2. Stop the source of the spill.
3. Deploy equipment to contain and recover the spilled product.
4. Protect sensitive areas (environmental, historic properties, and human use).
5. Track the extent of the spill and identify affected areas.
6. Cleanup contaminated areas and properly dispose of wastes.
7. Notify and update the public. Provide avenues for community involvement where appropriate.

2130.2 – HAZMAT

As with the risk assessment, the statewide response capability assessment focuses on large-scale releases of toxic gases. While the need for and type of response will depend on the particular substance released, the amount released, the release duration and a number of other factors, a simplified standard was developed to evaluate response capability. The standard consists of two objectives, and response capability is defined as the degree to which each of the two objectives can be met:

Defensive Response Objective. Detect the release and initiate immediate defensive measures including agency and public notification, plume movement prediction, and evacuation and shelter-in-place of the public.

Offensive Response Objective. Provide offensive measures including testing and monitoring chemical concentrations, setting hazard zones, entering hazardous atmospheres, and controlling the release.

A number of other objectives, of course, may have to be met during an actual response, such as providing medical care, firefighting capability, and decontamination. While all response elements are potentially important, examining the planning and resources needed to meet the above key objectives helps to focus the analysis.

While the first objective would apply for all toxic gas releases in populated areas, the second objective will not always be required or feasible. Offensive response may not be feasible, for example, for short duration releases. It is assumed, however, that there should be some offensive response capability wherever there are substantial risks.

2140 – General response priorities

Reference the National Contingency Plan, 40 CFR 300.317, for the National Response Priorities.

2140.1 - Federal Response Action Priorities/Strategies

The strategy for responding to a specific spill or hazmat incident depends upon numerous factors. The strategy can change as the situation changes. As a general rule, the strategies listed below should be used as a guide in developing an effective response. Consider all factors that may affect the particular situation and revise/modify/expand these priorities as the situation dictates.

The following priorities are general guidelines for response to a pollution incident. They are based in the premise that the safety of life is of paramount importance in any pollution incident, with the protection of property and the environment, although important, being secondary. Nothing in this part is meant to indicate that higher priority items must be completed before performing a lower priority task. They may be carried out simultaneously or in the most logical sequence for each individual incident.

Priority One: Safety of Life – For all incident which may occur, the safety of personnel, including response personnel, must be given absolute priority. No personnel are to be sent into an affected area without first determining the hazards involved and that adequate precautions have been taken to protect personnel.

Priority Two: Safety of Vessel/Facility and Cargo – The facility and/or vessel and its cargo shall become the second priority.

Priority Three: Protection of the Environment by elimination of the pollution source – Containment and recovery of oil in the open water must be effected expeditiously to preclude involvement of the beaches and shorelines. Due to remote location and restricted accessibility, it is extremely difficult to protect the majority of coastline by diversion and exclusion methods. Therefore, securing the source and open water containment and recovery are especially critical and should normally be the first line of defense to protect the environment. Likewise, spills, which occur on land or in upland watercourses, will be dammed, boomed, diked, etc., as feasible to prevent the spread of the pollutant downstream. Note: In situ burning of a vessel and its pollutants may be an alternative considered by the OSCs; this strategy places environmental protection priorities above saving the vessel and its cargo.

Priority Four: Protection of the Environment by diversion/exclusion, dispersion, or in situ burning – In the event of that the location of a spill or the weather conditions do not permit open water recovery, protection of the shoreline becomes paramount, especially areas of greatest sensitivity. It is not possible to protect some areas entirely or even in part. It may be necessary to sacrifice some area in order to achieve the best overall protection of the environment. The OSC may consider in situ burning as a response option. The use of dispersant must be considered early in the response phase while the oil is in the open water and conditions are agreeable. The *NCP, Subpart J* addresses in detail the responsibilities of the FOSC in the use of chemicals.

Priority Five: Protection of the Environment by beach cleanup and the use of sacrificial areas – It may not be possible to protect the entire shoreline from oil; in fact, spilled product may be allowed purposely to come ashore in some areas as an alternative to damaging other, more sensitive areas. Selection of the proper shoreline cleanup technique depends on many different factors, including the following:

- Depth of oil in the sediment
- Type of oil (tar balls, pooled oil, viscous coating, etc.)
- Trafficability of equipment on the shoreline
- Environmental or cultural sensitivity of the oil shoreline
- Prevailing oceanographic and meteorological conditions

The best way to minimize debate over the most appropriate response is to involve all interceded government and private agencies and other stakeholders. The shoreline assessment groups shall attempt to agree on the amount and character of the oil that is on the shorelines, anticipate interactions between the stranded oil and the environment, and assess the geological and ecological environment of the involved shorelines. Once a consensus is met on these parameters, an approach must be developed to determine the proper treatment required.

Shoreline cleanup options may include the use of physical and/or chemical processes. Physical shoreline cleaning methods include techniques such as natural recovery, manual sorbent application, manual removal of oiled materials, local pressure flushing, manual scraping, mechanical tilling, and mechanical removal using heavy equipment. Chemical shoreline cleanup products may increase the efficiency of water-washing during the cleanup of contaminated shorelines. However, the product must be listed on the NCP Product Schedule, and authorization must be obtained from the ARRT and the OSC of the spill. Bioremediation is also considered as a shoreline cleaning method. Bioremediation is the application of nutrients to the shoreline to accelerate the natural biodegradation of oil. The OSCs shall request site-specific guidelines for source protection measures required during shoreline cleanup operation.

The general pattern of response is as follows:

- 1) Control the source of the discharge
- 2) Limit the spread of the pollution
- 3) Mitigate the effects of the pollution. Mitigation may include recovering oil from the water and affected lands using physical or mechanical means such as sorbents and skimmers. The use of dispersants, chemicals, or in situ burning may mitigate pollution damage more effectively than physical or mechanical means.

The OSC must recognize that each habitat possesses unique qualities; different cleanup techniques may be required to accomplish the goals of removing as much pollutant as possible while minimizing any environmental damage from the cleanup technique. If shoreline contamination is expected, the OSC should ask the following questions to determine whether cleanup is an appropriate response:

- 1) Will cleanup activities cause more damage than leaving the oil to natural recovery or dissipation?
- 2) Will cleanup activities severely disrupt colonies of birds, marine mammals, or other wildlife?
- 3) Does the oil have a relatively low toxicity?
- 4) Is it expected that storms or seasonal erosion cycles will remove the oil from the shoreline?
- 5) Does the oil degrade rapidly or slowly?
- 6) Does the shoreline have a high energy level?
- 7) Is the oil present on the surface of the substrate and likely to remain there rather than being incorporated into sediments or buried by seasonal cycles?
- 8) Is it likely the oil will migrate to adjacent shoreline or near-shore areas?

2140.2 – State of Alaska Response Priorities

Safety: Ensure the safety of persons involved, responding, or exposed to the immediate effects of the incident.

Public Health: Ensure protection of public health and welfare from the direct or indirect effects of contamination of drinking water, air, and food.

Environment: Ensure protection of the environment, natural and cultural resources, and biota from the direct or indirect effects of contamination.

Cleanup: Ensure adequate containment, control, cleanup and disposal by the responsible party or supplement or take over when cleanup is inadequate.

Restoration: Ensure assessment of contamination and damage and restoration of property, natural resources and the environment.

Cost Recovery: Ensure recovery of costs and penalties to the Response Fund for response, containment, removal, remedial actions, or damage.

2200 – SAFETY

Personnel involved in oil spill response activities must comply with all applicable worker health and safety laws and regulations. The primary federal AND state regulations are the Occupational Safety and Health Administration (OSHA) standards for hazardous waste operations and emergency response found in 29 CFR 1910.120 and 08 AAC 61, respectively. These rules regulate the safety and health of employees involved in cleanup operations at uncontrolled hazardous waste sites being cleaned up under government mandate and in certain hazardous waste treatment, storage, and disposal operations conducted under the Resource Conservation and Recovery Act of 1976 (RCRA). The regulations also apply to both emergency response and post-emergency cleanup of hazardous substance spills. The definition of hazardous substance used in these regulations is much broader than the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), encompassing all CERCLA hazardous substances, RCRA hazardous waste, and all Department of Transportation (DOT) hazardous materials listed in 49 CFR part 172. Thus, most oils and oil spill responses are covered by these regulations. The rules cover employee protection during initial site characterization and analysis, monitoring activities, material handling activities, training, and emergency response.

OSHA classifies an area impacted by oil as an uncontrolled hazardous waste site. However, the regulations do not automatically apply to an oil spill cleanup. There must be an operation that involves employee exposure or the reasonable possibility for employee exposure to safety or health hazards. A typical beach cleanup worker collecting tar balls of weathered oil or deploying sorbents to collect sheen may not be exposed to a safety or health risk. The role of the site safety and health supervisor is to assess the site, determine the safety and health hazards present, and determine if OSHA regulations apply. If an OSHA field compliance officer is on scene, he or she should be consulted to determine the applicability of OSHA regulation. Disputes should be referred to the Department of Labor representative on the Alaska Regional Response Team (RRT). The individual making the site characterization should communicate the hazards associated with the spill and provide recommendations for the protection of workers' safety and health through a site safety plan. The responsibility for the health and safety of personnel supporting a pollution response mission rests with the On-Scene Coordinator (OSC).

In an oil spill response where OSHA regulations apply, the OSC must ensure that paragraphs (b) through (o) and paragraph (q) of 29 CFR 1910.120 are complied with. Of most concern are the training requirements for response personnel. Personnel who are routinely involved in pollution response should complete a 40-hour course meeting the OSHA training in paragraph (e) of 29 CFR 1910.120. Training records should reflect that OSHA requirements have been satisfied. Contractors are responsible for certifying the training of their employees. OSHA has recognized the need to remove oil from the environment and has empowered the OSHA representative to the RRT to reduce the training requirement

to a minimum of 4 hours for responders engaged in post-emergency response operations. An example of a post-emergency response effort is shoreline cleanup operations. The reduced training applies to all USCG and other government personnel and to the private sector. This information may be found in OSHA Instruction CPL 2-2.51. The level of training required depends on the potential for exposure. Workers required to use respirators must have 40 hours of off-site training. The OSHA field compliance officer should be contacted to ascertain the worker training requirements and develop an implementation plan to minimize the hazards of exposure to workers involved in cleanup operations. State requirements that are more restrictive will preempt federal requirements.

The following link is an excellent OSHA publication, [Training Marine Oil Spill Response Workers under OSHA's Hazardous Waste Operations and Emergency Response Standard](#). This document provides specific training requirements for spill responders during both the emergency response phase as well as the post-emergency response cleanup phase.

Within the State of Alaska, hospital decontamination stations have been established at a few hospitals. Field decontamination is critical prior to transporting injured workers to a medical facility.

2210 – Site characterization

Reference the Alaska Department of Environmental Conservation [Spill Tactics For Alaska Responders \(STAR\) Manual](#) for site characterization information.

2220 – Site Safety Plan Development

The following is a site safety plan skeleton, which can be used to develop an incident specific site safety plan. Examples are available and may be used as well given the requirements of a response or exercise; Reference [Section 2220.1](#) of this document for completed examples.

STANDARD SITE SAFETY PLAN FOR EMERGENCY/POST-EMERGENCY PHASE COASTAL OIL SPILLS (4/93)

A. SITE DESCRIPTION

Site generally referred to as: _____

Location: _____

Surrounding population: ___ industrial, ___ residential, ___ rural, ___ unpopulated,

___ other: _____

Topography: ___ rocky, ___ sandy/gravel beach, ___ cliffs, ___ marshes, ___ docks,

___ Other: _____

Primary Hazards: ___ Chemical Exposure, ___ Fire/Explosion, ___ Oxygen Deficiency,

___ Confined/Enclosed Space Entry, ___ Ionizing Radiation, ___ Biological Hazards

___ Safety Hazards, ___ Heat Stress, ___ Cold Exposure, ___ Noise, ___ Other: _____

Pathways for hazardous substance dispersion: _____

Pathways have been noted on the site safety map provided as Attachment _____.

Reference procedures for handling drums, containers, and spill containment, provided as Attachments _____.

B. WORK PLAN AND ENTRY OBJECTIVES

1. Work Plan: All work shall be conducted in accordance with procedures established during pre-entry briefings and attached work plans. ___ *A work plan is provided as Attachment* _____.

2. Entry Objectives: Daily objectives may include site surveys, mechanical cleaning, oil recovery, booming, dispersant application, wildlife rehabilitation/hazing, and related activities. Detailed objectives shall be developed daily, and shall be described during the pre-entry safety briefing.

C. SITE ORGANIZATION

1. Definitions:

OSC: The On-Scene Coordinator (OSC) is the pre-designated Federal, State, Local, or Responsible Party official responsible for incident management in accordance with the Regional Contingency Plan. The OSC's designated rep serves as the on-site supervisor for response personnel.

SSHO: The Site Safety and Health Officer (SSHO), often referred to simply as the Site Safety Officer, is the single individual responsible for developing and implementing the OSC's site-specific site safety and health plan.

SSHP: Site Safety and Health Supervisor(s) (SSHP) is a mandatory position under 29 CFR 1910.120. The SSHP, often referred to simply as the Site Safety Supervisor, is the individual(s) in the field responsible for enforcing the SSHO's site-specific site safety and health plan. An SSHP must be on-site at all times while the SSHO may be with the OSC or at other locations.

2. Positions:

Function	Name and Phone (if appropriate)
FOSC	
SOSC	
LOSC	
RPOSC	
Incident Commander	
OSC's On-Site rep/supervisor	
FOSC Rep	
SOSC Rep	
LOSC Rep	
RPOSC Rep	
Site Safety and Health Officer	
Site Safety & Health Supervisor(s)	Reference the posted organization on-site/work plan/briefing log.
Public Affairs Officer	
Scientific Support Coordinator	
National Pollution Fund Center Case Officer	
BOA Contract Supervisor	
Other Federal/State/Local reps:	
RP's representative	
RP's On-Site rep	
RP's On-Site Contract Supervisor	
RP's Safety & Health Officer	
RP's Safety & Health Supervisor	
Other R.P. reps	

D. SITE CONTROL

1. Anyone entering or departing a Work Area shall report to the site supervisor or designated representative.
2. No person shall enter a site without subscribing to this or another appropriate Site Safety and Health plan.

3. The buddy system is mandatory for everyone on site.
4. Training: In general, all personnel on-site shall be trained adequately to perform their assigned tasks safely. The general training level requirement is technician level and/or routine site worker (40-hrs. and 3 days on-the-job training minimum) except as noted below.

JOB DESCRIPTION:	TRAINING LEVEL:
_____	_____
_____	_____
_____	_____

_____ Guidelines for assessment of training/qualification requirements has been provided as Attachment_____.

All personnel entering the site shall be fully informed about applicable hazards and procedures on site. Reference section L. below for on-site informational briefings program.

5. **Site Boundaries:** Control boundaries have been established in the site safety map below according to the following guidelines:
 - a. The HOT ZONE, or EXCLUSION ZONE, is the area where contamination or product hazards are expected.
 - b. The WARM ZONE, or CONTAMINATION REDUCTION ZONE, is a transition area between the HOT ZONE and the COLD ZONE. It is the area where DECONTAMINATION is conducted for personnel and equipment leaving the HOT ZONE.
 - c. The COLD ZONE, or SUPPORT ZONE, is an area adjacent to the WARM ZONE that is intended to remain safe and as free of contamination as possible.

6. Site Safety Map: The site safety map includes the location of items such as: zone boundaries, decontamination station, washing, toilet/hygiene facilities, first aid equipment, fire extinguishers, command posts, equipment staging/storage, eating/rest areas, animal rehab/hazing stations, and locations of identified hazards.

_____ A Site Safety Map is provided as Attachment_____.

7. Decontamination: Field decontamination of injured workers is essential prior to transport to a medical facility. Hospital decontamination stations have not been established within the State of Alaska to support patients contaminated during oil or hazardous substance response operations.

E. HAZARD EVALUATION:

1. **Chemical Hazards:** Check appropriate category of oil, attach generic information sheet, and attach specific MSDS when available. Check all applicable below:

_____ Oil containing benzene and/or other high vapor pressure chemicals.

_____ Hazard information is provided as Attachment_____.

_____ Oil that does not contain benzene and/or other high vapor pressure chemicals.

_____ Hazard information is provided as Attachment_____.

___ Hydrogen sulfide (from sour crude oil or anaerobic decay of organic materials).

___ Hazard information is provided as Attachment___.

___ Dispersant applications.

___ Hazard information is provided as Attachment___.

___ Bioremediation application.

___ Hazard information is provided as Attachment___.

2. Exposure/Risk Assessment Monitoring For Chemical and Physical Hazards: The following monitoring shall be conducted with monitoring equipment calibrated and maintained in accordance with the manufacturer's instructions (electronic equipment shall be calibrated before each day's use).

MONITOR	FREQUENCY
___ Combustible gas	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ Oxygen	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ H2S dosimeter	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ H2S meter	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ HNU	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ OVA	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ WBGT	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ Noise	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ Organic Vapor	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____
___ <i>Other:</i> _____	___ continuous, ___ hourly, ___ daily, ___ <i>Other:</i> _____

3. Additional Hazards: Additional hazards may be encountered on site, and these along with any other applicable hazards found during the site survey must be marked on the attached maps.

F. GENERAL SAFE WORK PRACTICES. The following safe work practices shall be adhered to while on site. Please check those that are appropriate and add any additional ones:

- BUDDY SYSTEM. The buddy system shall be observed inside the Work Area (EXCLUSION and CONTAMINATION REDUCTION ZONES). Personnel must work within sight of their assigned partner at all times. A partner shall be assigned by the site safety supervisor as personnel check in. Personnel shall use whistles to indicate that they need assistance in areas where they may be obscured from supervisors (e.g. high grass, boulders, or warehouse areas) as noted on the Project Map.
- OCCUPATIONAL MEDICAL MONITORING. Personnel shall be enrolled in an occupational medical monitoring program in accordance with 29 CFR 1910.120.
- FIRES. Each restriction zone and associated contamination reduction zone shall have at least one each of the following:
 - a fully charged Class A fire extinguisher for ordinary fires,
 - a fully charged Class B fire extinguisher for liquid fires, and

- A hand held foghorn to alert personnel.

The above items shall be maintained in a readily accessible location, clearly labeled in red, and with the location noted on the project map. An ABC or AB fire extinguisher can be substituted for an A or B fire extinguisher.

- LIGHTING. Fixed or portable lighting shall be maintained for dark areas or work after sunset to ensure that sufficient illumination is provided. (Reference TABLE H-120.1 of 29 CFR 1910.120(m) for Minimum Illumination Intensities.)
- SLIPPERY ROCKS AND SURFACES. All personnel in the work area shall wear chemical resistant safety boots with steel toe/shank and textured bottoms (neoprene is a common material that is fairly resistant to many oils). Boat operators may substitute clean deck shoes with textured soles kept free of oil on cloth/leather uppers.
- SLIP-TRIP-FALL HAZARDS. In addition to proper footwear, personnel will be briefed to be wary of tripping hazards. Safety belts and lifelines will also be worn when working at heights. Proper safety precautions will be taken when working with ladders.
- WORK NEAR WATER. All personnel working in boats, on docks, or generally within 10 feet of water deeper than 3 feet, shall wear USCG approved personal flotation devices (PFDs) or work vests.
- HEAT STRESS. The site safety and health supervisor shall generally be guided by the ACGIH guidelines in determining work/rest periods. Fluids shall be available at all times and encouraged during rest periods. Further guidelines are provided as Attachment:_____.
- COLD STRESS. The site safety and health supervisor shall generally be guided by the ACGIH guidelines in determining work/rest periods. Workers shall be provided with adequate warm clothing, rest opportunities, exposure protection, warm and/or sweet fluids shall also be available during rest periods. For prolonged water temperatures below 59 degrees F, or a combined water and air temperature less than 120 degrees F, exposure suits shall be worn by personnel working/traveling in small boats, and immersion suits shall be available for vessel operations other than small boats. Further guidelines are provided as Attachment:_____.
- HIGH NOISE LEVELS. Hearing protection shall be used in high noise areas (exceeding 84 dBA--generally where noise levels require personnel to raise their voices to be heard) designated by the site safety supervisor.
- ELECTRICAL HAZARDS. Electrical hazards are designated on the site map, and shall be marked with suitable placards, barricades, or warning tape as necessary.
- TRAP HAZARDS. Open manholes, pits, trenches, or similar hazards are noted on the site map. The site safety supervisor shall ensure that these locations are periodically checked during the day.
- MUD. Dangerous mud flats posing a trap hazard shall be designated on the site safety map as areas off limits to personnel. Mark these locations with banner tape, barricades, or other marking equipment.

- CARBON MONOXIDE. Equipment operators shall ensure that personnel do not linger or work near exhaust pipes.
 - UV LIGHT EXPOSURE. Sunscreens of protection factor 15 (or greater), and UV tinted safety glasses shall be made available for response personnel as needed.
 - HELICOPTER OPERATIONS. Pilots shall provide safety briefing for all passengers. Helicopter procedures are provided as attachment:_____.
 - MOTOR VEHICLES. Drivers shall maintain a safe speed at all times, and shall not be allowed to operate vehicles in a reckless manner. A vehicle safety briefing is provided as attachment_____.
 - ALL TERRAIN VEHICLES (ATVs). Drivers shall maintain a safe speed at all times, and shall not be allowed to operate vehicles in a reckless manner. ATV drivers shall not operate ATVs outside of areas and lanes specified by the site safety supervisor.
 - DRUM HANDLING AND SPILL CONTAINMENT.
 - Drums and containers must be handled in accordance with 29 CFR 1910.120. Containers must be labeled and constructed in accordance with EPA (40 CFR 264-265, and 300), and DOT (49 CFR 171-178) regulations.
 - Temporary holding/staging areas for drums and containers containing waste materials shall be constructed to contain spillage, run-off, or accidental releases of materials.
 - Manual lifting and handling of drums and containers shall be kept to a minimum. To the extent possible, mechanical devices, drum slings or other mechanical assisting devices designed for that purpose shall be used.

Safe-lifting procedures are provided as Attachment_____.

Drum-handling procedures are provided as Attachment_____.
 - CONFINED SPACES. Confined spaces will not normally be entered by response personnel during oil spill response operations. If a confined space must be entered or hot work conducted on a confined space, a specific confined space entry work plan and confined space work authorization checklist will be developed for that operation.
- A confined space work plan is provided as Attachment_____.
- A confined space work authorization checklist is provided as Attachment_____.
- POISONOUS/INFECTIOUS INSECTS, BITES, STINGS, PLANTS.
 - Bee Stings (also hornet or wasp bites)
 - Animal Bites (infection hazard, and/or rabies from some common sources such as: foxes, bats, dogs, cats, and cows).
 - Marine Stings and Punctures (jellyfish, man-o-war, anemones, corals, hydras, urchins, cone shells, stingrays, and spiny fish)
 - Poisonous Plants (poison ivy, oak, or sumac)

— General Prevention:

- During morning safety briefings, provide information on the location of hazards and how to deal with problems.
- Personnel should be provided with
 - long sleeved clothing
 - insect repellent
- Personnel should inspect each other for signs of infected bites during breaks when working in designated areas.
- Personnel with allergies to bee stings or insect bites may suffer a medical emergency if bitten. Supervisors on site should be prepared to deal with these medical emergencies.
- Personnel with severe allergies must work in areas away from known/suspected hazards.
- Personnel with allergies to bee stings or other insect bites should notify their supervisors AND the site safety supervisor when reporting on this site.
- Personnel shall be briefed on procedures in accordance with the guidelines provided as Attachment:_____.

— BEAR SAFETY/USE OF FIREARMS. Confrontation with bears exhibiting aggressive behavior can be life threatening for employees engaged in fieldwork at remote sites. State regulations allow taking of bears in defense of life after other measures fail. Personal safety is the foremost consideration in bear encounters, but all reasonable alternative methods of deterring an aggressive bear shall be employed. These include retreat, noise making, chemical repellents, and detonation of flares, if feasible.

- Proper training of personnel should cover the following at a minimum:
- Avoiding bear encounters.
- Interpreting bear behaviors.
- Handling, maintaining and using non-lethal repellents.
- Handling, maintaining and using firearms.
- Requirements of the State Defense of Life and Property Regulations.

Bear safety/firearms handling procedures are provided as Attachment_____. The Alaska Department of Environmental Conservation has also developed a document entitled "Bear Safety/Firearms Program Guidance" for ADEC personnel.

G. PERSONAL PROTECTIVE EQUIPMENT (PPE).

1. Levels of Protection:

- **Level A:** Should be worn when the highest level of respiratory, skin, and eye protection is needed.
- **Level B:** Should be worn when the highest level of respiratory protection is needed, but a lesser level of skin protection.
- **Level C:** Should be worn when the criteria for using air-purifying respirators are met.
- **Level D:** Should be worn only as a work uniform and not on any site with respiratory or skin hazards. It provides no protection against chemical hazards.

— Reference the PPE ensemble descriptions provided as Attachment_____.

2. The following PPE ensembles shall be used while on site:

LOCATION:	TASK:	LEVEL (CIRCLE):
GENERAL	Monitors/Supervisors	A B C D
	Shoreline Cleanup Crew	A B C D
	Vacuum Truck Crews	A B C D
	High Pressure Wash Crew	A B C D
	Abrasive Cleaning Crew	A B C D
	Hot Water Wash Crew	A B C D
	Boat Drivers	A B C D
	Boat Crews	A B C D
	Skimmer Crews	A B C D
	Boom Crews	A B C D
	Sampling Teams	A B C D
	Survey Teams	A B C D
	Product Pumping	A B C D
	Dispersants Crews	A B C D
	Bioremediation Crews	A B C D
	Bird/Mammal Capture	A B C D
	Bird/Mammal Hazing	A B C D
	Bird/Mammal Transport	A B C D
		A B C D
		A B C D
		A B C D
COLD ZONE	Response Personnel	A B C D
	Visitors	A B C D
		A B C D
		A B C D
		A B C D
		A B C D

H. DECONTAMINATION PROCEDURES

Contaminated personnel and personnel entering contaminated areas shall be decontaminated in accordance with the instructions of the site safety and health supervisor.

— Reference the Decontamination Guidelines and Layout provided as Attachments_____.

I. SANITATION & PERSONAL HYGIENE

Potable water, non-potable water, toilets and personal hygiene facilities shall be readily available.

— For further information Reference Attachment_____.

J. EMERGENCY PROCEDURES

1. General: In all cases when an onsite emergency occurs, immediate notification will be made via the quickest means available. Personnel shall not reenter the work area or restart work until:

- The condition resulting in the emergency has been investigated by supervisory personnel, and has been corrected;
- Hazards have been reassessed; and
- Site personnel have been briefed on any changes in the operation and site safety plan.

— Hospitals listed under communications section have been contacted (chemical emergency hospital agrees to take patients from site).

— Fire departments listed under communications section have been contacted.

— Ambulance services listed under communications section have been contacted (note those which will take chemical emergencies).

— ATSDR has been notified of site operations.

— Police forces listed under communications section have been notified.

2. Emergency Medical Procedures:

- Contact designated EMT (Reference the posted organization/work plan).
- Do not attempt to move seriously injured personnel, call for an ambulance to come to the injured person.
- For bites, stings, or poisonous animals/plants follow the procedures provided in Attachment_____.

- The closest hospital for regular emergencies is: _____
(Reference K. Communications, below, for phone number)

- The closest hospital for chemical exposure emergencies is: _____
(Reference K. Communications, below, for phone number) **Contact ATSDR (404) 639-0615 (24 hr) for chemical incidents.**

3. Emergency Fire Procedures:

- DO NOT attempt to fight fires unless it is a small fire. A small fire is generally considered to be a fire in the early stages of development that can readily be extinguished in a few minutes time with personnel and equipment in the immediate area.
- DO NOT take extraordinary measures to fight fires.
- YOU MUST sound the appropriate fire signal if fire cannot be put out quickly.
- Alert nearby personnel to call fire department.

- Notify supervisor.
- When the fire alarm is sounded, personnel shall immediately leave the work area WITH THEIR ASSIGNED BUDDY and proceed to the pre-designated assembly point using the designated evacuation route (Reference evacuation routes and assembly point below).
- The Site Supervisor OR the Fire Department shall ensure that the fire is extinguished and a temporary fire watch has been posted BEFORE restarting work.

4. Evacuation:

EVACUATION & FIRE SIGNAL(S):

PRIMARY EVACUATION ROUTE:

SECONDARY EVACUATION ROUTE:

ASSEMBLY POINT:

K. COMMUNICATIONS.

1. General signals:

- ☐ THUMBS UP: I am OK / I agree.
- ☐ THUMBS DOWN: Do not agree.
- ☐ HANDS ACROSS THROAT: Out of air/trouble breathing
- ☐ GRAB HAND/ARM: Come with me
- ☐ HANDS ON HEAD: I need assistance
- ☐ BOTH HANDS ON WAIST: Leave area immediately

2. Radio communications:

Working:

Frequency: _____, channel: _____ (__ VHF __ UHF __ CB _____ OTHER)

Emergency:

freq: _____, chnl: _____ (__ VHF __ UHF __ CB _____ OTHER)

freq: _____, chnl: _____ (__ VHF __ UHF __ CB _____ OTHER)

3. Phone communications:

On-Scene Coordinator:

(_____) _____ (_voice _fax _cell _pager _home)

(_____) _____ (_voice _fax _cell _pager _home)

Incident Commander:

(_____) _____ (_voice _fax _cell _pager _home)

L. SITE SAFETY BRIEFINGS/MEETINGS.

1. Initial Briefing: All personnel, employees, contractors, and subcontractors shall be provided with an initial site safety briefing to communicate the nature, level and degree of hazards expected on site and to present the emergency response plan.

2. Shift & Other Briefings: Personnel will also receive regular briefings before and after each shift, before making a LEVEL A/B hot zone entry, and when significant changes are made in the work procedures or safety plans. These site safety meetings/briefings shall be held by the Site Supervisor. At a minimum, these meetings will describe the work to be accomplished, discuss safety procedure changes, and note any items that need to be passed to other crews. General safety training topics should also be covered based on points raised in previous meetings and the site safety plan attachments.

_____ A briefing log is provided as Attachment: _____.

M. THE SITE SAFETY OFFICER.

The Site Safety Officer for this incident is: _____

The responsibilities of the SITE SAFETY OFFICER include (but are not limited to):

- Coordination of all safety and health concerns for the entire work site;
- Keeping this plan current; and
- Liaison with site safety officers from other organizations.

N. AUTHORIZATIONS:

SITE SAFETY OFFICER: _____/DATE: _____

ON SCENE COORDINATOR: _____/DATE: _____

2220.1 – Sample Site Safety Plan

Several example site safety plans are available on [the USCG Homeport website, under Incident Management and Preparedness.](#)

2230 – OSHA Training for Volunteers

Reference [Section 4320](#) of this document for information on volunteer use during an incident response.

2300 – INFORMATION

2310 – Protocol for Access/Timing of Media Briefings

2310.1 – Public Information Officer (PIO) Protocol

Oil and hazardous substance spills generate a great deal of public attention and media coverage, particularly if a spill is large or the substance spilled is extremely hazardous. This attention, reflecting legitimate public concern, may be local, statewide, or even national or international in scope.

Public affairs specialists or information officers keep the public and the news media informed about the facts and current situation of an incident and of the activities of the response effort and the agencies and officials involved. The Public Information Officer (PIO) of the Unified Command's Incident Command System organization serves as the lead manager for all spill-related public information activities conducted on behalf of the Unified Command or an On-Scene Coordinator (OSC).

Under the direction of the State OSC, the ADEC Public Information Officer serves as the lead manager for all spill-related public information activities that fall under State jurisdiction and will maintain a State public information office, as needed.

In the event of a major incident, the Unified Command in consultation with the PIO may choose to establish a Joint Information Center where public affairs professionals from organizations involved in incident management activities can co-locate to perform critical emergency information, crisis communications, and public affairs functions.

The Public Information Officer (PIO) is the communications coordinator, and often the spokesperson for the agency or organization they represent. The PIO is responsible for developing and releasing information about the incident to the news media, to incident personnel, and to other appropriate agencies and organizations. PIOs handle organizational functions, including media, community, industry, governmental, tribal, and interest group relations. They do more than “tell their organization’s story.” They must understand the attitudes and concerns of the community, public interest groups, and other responding agencies; establish; and maintain cooperative relationships with them and with representatives from print and broadcast journalism.

The PIO has three principal responsibilities:

1. **Gather incident data.** This involves understanding how an ICS/Unified Command response operation functions, then developing an effective method for obtaining up-to-date information from appropriate ICS Sections.
2. **Analyze public perceptions of the response.** This involves employing techniques for obtaining community feedback to provide response agencies with insight into community information needs, their expectations for the role to be played by the response agencies, and the lessons to be learned from specific response efforts.
3. **Inform the public.** That is, to serve as the source of accurate and comprehensive information about the incident and the response to a specific set of audiences.

The PIO drafts press releases and contacts people in the media who might print or broadcast material or information. The PIO must show creativity, initiative, and good judgment and have the ability to communicate thoughts clearly and simply. The PIO can operate from an office or from the field. During an incident, the PIO serves under the Unified Command and often can be identified by a helmet or vest with the letters "PIO" on it.

Staff and Resources: Experienced crisis managers know that when public information officers are needed, the need can be critical, and the Unified Command's or the OSC's effectiveness with the media and public is often in direct proportion to the PIO's experience and training in complex environmental emergencies. Effective communication with the public is indispensable to a successful spill response.

Arriving at a spill site, the information officer must ensure that an officer/recorder is assigned from the professional spill response staff to assist in recording and transmitting written information. The staff person is responsible for writing a "spill bulletin" summarizing salient facts and information about the incident. The bulletin is transmitted, on a frequent basis and usually by Fax, to ADEC's Central Office in Juneau, the Governor's Office, communities, Native groups, resource organizations, the media, and federal agencies (as appropriate). The information contained in the bulletin will prove useful to the information officer, as well.

Additional information officers and clerical staff should be added to handle the increasing workload, as should photographic services, both still and video. Resources required for the spill information office include suitable maps of the impacted area, up-to-date media and community contact lists, dedicated phone lines, portable phones or beepers, if available, computers for all writers on staff, printers, a copier, and a fax machine. An advance agreement should be made with the Unified Command that photos and video footage shot for public information may be used for that purpose, without delay or restriction for legal reviews, except when such is warranted due to private property concerns.

Staying Ahead of Changing Events: One of the PIO's precepts for day-to-day effectiveness is to stay ahead of the "information curve." During a rapidly changing emergency, this will become one of his or her most exacting challenges. Not only must this person assemble information quickly, arrange interviews and assist reporters, but he/she also must maintain close contact with the OSC and spill team members to anticipate, as much as possible, each major development in the spill response that will generate the next wave of public concern or media interest.

These events may come in the form of escalated response actions, the release of new water sample data or wildlife mortality figures, or a formal decision delivered by a member of the Unified Command or others serving in an official capacity. When events such as these can be anticipated, press information can be prepared to enable the OSC to maintain his/her role as the primary responsible spokesperson for the incident. Additionally, the information officer must work within media deadlines as much as possible. Much of the national news media is driven by East Coast deadlines, a full four hours ahead of Alaska, and this may require special attention. It is a simple fact that information delivered prior to deadlines will be more effectively reported by the press.

To stay ahead of changing events and to meet deadlines, the PIO must assimilate a mass of information by coordinating with local government officials and federal, State, and responsible party public information staff, attending staff meetings, reading situation reports, and asking many questions. All of this consumes time. Sufficient staff support and resources in the spill information office or Joint

Information Center is essential for answering phones, writing and dispensing bulletins, and hosting the press. Obtaining staff resources is thus one of the PIO's first duties upon arrival at a spill site.

Community Relations: Providing information directly to members of the impacted community, free of the filtering and potentially distorting effect of the media is critical to public understanding of the incident response. Community relations may include scheduling of public meetings, preparing speeches, and coordinating public activities with public officials and protocol personnel.

In order to ensure that important constituencies are not overlooked or slighted during a major response, it is important that a Community Relations/Liaison Officer coordinate closely with the public affairs element. (Under no circumstances should community relations be a collateral duty of the media relations officer or the Joint Information Center during a major incident).

Additionally, the PIO should contact local government officials and have them offer information and comments on the situation. State, federal and local governments should coordinate their responses and press releases to the media.

Internal Information: Internal information is the process of properly informing internal staff of the status of all pertinent activities. By keeping staff apprised with information that is accurate and consistent, efforts to properly inform the rest of the response community will be successful.

At a minimum, all personnel assigned to response duties should be provided with access to the daily fact sheet or any published spill bulletins prepared by the PIO or the JIC. This will help ensure a consistent and accurate flow of information.

2310.2 – PIO Checklists

2310.2.1 – General Checklist:

In response to a spill incident, as a member of the Unified Command Staff, the PIO will seek to perform the following:

- ❑ Obtain briefing from the Incident Commander.
- ❑ Prepare initial information summary, obtain Unified Command approval, and release for dissemination as soon as possible after arrival.
- ❑ In consultation with the Unified Command, establish a Joint Information Center, if warranted; manage the activated Joint Information Center.
- ❑ Arrange for necessary workspace, materials, telephones and staffing.
- ❑ Observe constraints on the release of information imposed by the Unified Command.
- ❑ Release news to media and post information in command post and other appropriate locations.
- ❑ Ensure a consistent message is offered in all press releases, fact sheets, interviews and other public information forums.
- ❑ Attend all pertinent meetings to update information releases and situation reports.
- ❑ Screen visiting journalists and VIPs and arrange escorting when appropriate.
- ❑ Respond to special requests for information.
- ❑ Organize opportunities for media interviews, site visits, etc. during incident.
- ❑ Establish a press area, if deemed necessary, distribute passes, and ensure periodic contact with the media in the press area, using established time intervals, if applicable.
- ❑ Supervise the conduct of any outside news media, responding only with those details of the situation as authorized by the Unified Command. Establish the “ground rules” that are determined necessary by the incident commander given the seriousness of the situation.
- ❑ Respond to all telephone inquiries from news media, local residents and other in a timely manner.
- ❑ Standardize all forms of new releases and reports.
- ❑ Maintain a written log of all information received from the Unified Command and relayed or released on their authorization.
- ❑ Prepare a final written news release for distribution to the media with approval of the Unified Command.

2310.2.2 – State of Alaska Checklist:

No two emergencies are identical. Each event will challenge the public information officer's skills in communication, organization and diplomacy. This individual must design the best information response possible, flexibly and creatively, to meet the given situation. The following checklist, intended as an aid to the basics, is offered as a starting point:

Pre-planning:

- ❑ Maintain up-to-date information on the major facilities in the State. Include a file of relevant facts on the industries and the major environmental and public health resources near facilities.
- ❑ Review major oil and hazardous substance transportation routes and examples of vessel and facility contingency plans.
- ❑ At both the PIO's home and office, keep a kit with communications information for Alaska locales, including community and media contact lists.
- ❑ Participate in spill drills.

At the Scene

- ❑ Coordinate with the SOSC and spill response team.
- ❑ Make all notifications as needed:
 - ADEC information officer in Commissioner's Office
 - Governor's Press Secretary
 - ADF&G Public Information Office and other State agencies as needed (ADNR, ADMVA/DHSEM, ADHSS)
 - USCG or EPA Press Officers; and
 - RP's press officer or press spokesperson
- ❑ Identify Liaison Officer/Recorder and determine when first Spill Bulletin will be released.
- ❑ Initiate first press release with basic facts on spill; distribute as soon as possible.
- ❑ Identify additional staffing, office, and equipment needs, if any, and submit to SOSC or office administrator.
- ❑ Open communication channels with local government officials of affected communities; assist SOSC in keeping local community leadership informed.
- ❑ Login press calls, record names, phone and fax numbers of reporters.
- ❑ Activate video and still photography team.
- ❑ Arrange to obtain maps from mapping team, with regular updates.
- ❑ Work with SOSC to set up first press briefing.
- ❑ Attend key staff coordination and update meetings.
- ❑ Identify where reporters and TV crews may go and, if necessary, assist them in getting there.

News Briefings

- ❑ Coordinate with OSC: who will be spokesperson(s), subject matter to be covered, other state staff required, backup materials, time limit.
- ❑ Develop list of probable questions for SOSC.
- ❑ At beginning of briefing, introduce yourself and speakers, give titles and spelling of names, indicate subject matter to be covered.
- ❑ Note or tape questions and answers for follow-up.

Type of Information for Release

- Names and contact phones to obtain information on the spill.
- Exact location of the incident, including the proper name of the site, commercial entity name.

- Time and date of incident.
- Type of substance spilled, nature of incident (fire, explosion, oil spill, etc.), and size, and effects to date on humans or resources. For any casualties, withhold names pending notification of next-of-kin.
- Actions taken or recommendations by the Unified Command for actions to respond to the incident. If appropriate, obtain quotes from the Unified Command officials regarding actions needed.
- Resources in area that could be at further risk, including human risks, and information needed by the public for self-protection.
- How the Unified Command is coordinating efforts with local communities and residents.

Precautions: Information released publicly during an incident may be used in later litigation. When in doubt, secure advice from the legal authorities. In general, adhere to the following:

- Do not speculate about the facts. "I don't know but I'll find out" is sometimes the best answer.
- Do not make damage estimates in terms of dollars nor confirm estimates made by persons other than those serving in an official capacity in the spill response operation.
- Withhold names of casualties pending notification of next-of-kin.

After the Spill Response: When the crisis has subsided and media interest abated, the Unified Command's public information staff, and local government officials, as appropriate, should meet to evaluate their effectiveness with the media and the public.

2310.2.3 – USCG Checklist

- ❑ Designate an incident Public Affairs Officer. This person may change with time from a unit officer to a PIAT CWO to a District officer to a senior officer from another command. Make sure all PAs know whom the PAO is and understand that the PAO reports to the OSC.
- ❑ Complete fact sheet and prepare a 30-second media statement (about 150 words maximum).
- ❑ Record media statement on Voice-mail, record-a-phone or similar automatic message service so media can get updates.
- ❑ Use phone-screening system (watch standers, automated, etc.) to direct news media to prerecorded updates.
- ❑ Have three phone lines available for public affairs use: incoming (published), outgoing (unpublished), and a fax line.
- ❑ Contact district (District Public Affairs or DPA) at outset of any medium or larger spill to arrange for PA backup. Temporary Active Duty (TAD) PAs may be used or referral of media calls to DPA or some variation.
- ❑ Contact NSFCC, PIAT to alert in case of any potential major incident (if not already done as part of #5 above). Note: FOSC may request PIAT assistance at any time regardless of spill size.
- ❑ Update fact sheet at least daily and fax or phone update to major media outlets.
- ❑ Schedule a media-availability meeting with the FOSC, at least daily when media interest is great (if unsure of necessity, ask reporters; they will tell you whether the story merits the meetings).
- ❑ The primary purpose of a news conference/media-availability meeting is to put forth the FOSC's assessment of the progress of the response. A secondary purpose is to answer media questions. Use the Fact Sheet as the primary tool for briefings.
- ❑ In major spills, designate a protocol office to handle VIP visitors. Do not assign this function to the PAO.
- ❑ In major spills of high interest, designate an FOSC aide. Access to the FOSC and the FOSC's time is critical in such incidents and must be scheduled carefully.
- ❑ Require the PAO to brief the FOSC each morning on the media coverage of the incident and the specific public affairs goals for the day. The FOSC should update the fact sheet at this time.
- ❑ Establish a Joint Information Center (normally dictated by the size of the incident.) Only the FOSC or the FOSC's spokesperson speaks for all agencies, but each agency can speak for itself.
- ❑ Maintain close contact with appropriate local government officials.

2310.3 – Media Interaction

General: The public's opinion of response efforts are not always based upon what action has been taken, but upon what information they have received. Supplying information to the media is a critical component of spill response and is a primary function of the Unified Command. Early and accurate news releases serve to minimize public apprehension and to enhance their faith in the response community's ability to deal with oil and hazardous substance contingencies.

To ensure an accurate flow of information, a single point of contact or pool of public affairs personnel should be established for media relations. The number of people needed to respond to inquiries will vary depending on the size of the incident and the media interest involved. The Unified Command has many resources available to assist with the media. For small spills, the assistance of the USCG Public Affairs Officer may be sufficient. For larger spills with more media interest, it may be necessary to seek assistance from other sources, such as the USCG's Public Information Assist Team (PIAT), as well as State agency public information officers.

The following general guidelines are also provided:

- Fast and accurate information must be provided to protect public health, obtain public cooperation, and to assist in guarding against further environmental damage.
- Clear communication by spill response authorities is essential for the delivery of accurate information to avert misinformation or rumors sometimes engendered by an emergency.
- The OSC must immediately establish and maintain his/her position as chief articulator of an incident. As statutory guardian of public health and resources, it is the Federal and State OSC's role--not the role of the spiller or others--to deliver public statements regarding the effects of a spill, including evaluations of a spill's size, extent, nature, dangers to public health or resources, details of the response plan, the OSCs' expectations for response plan implementation, degree of success or lack of success of a spill response, and the anticipated long-term effects of a spill.
- When a spill occurs, the OSC must immediately open communications with local government officials of affected communities, conveying facts needed by residents for their own response activities and protection of public health and resources. Initial phone calls to establish communication channels with local governments and appropriate organizations, such as fishermen and Native groups, should be followed by regular updates through spill bulletins, press releases, and briefings.

Credibility with the press and the public is the best foundation for an effective public information effort, and the efficient delivery of accurate information is the key to credibility.

Media Access: The question of media access to spill sites may arise during emergencies, usually because of one of three issues: safety; potential interference with response activities; or admission to private property.

In general, it should be the Unified Command's policy to allow free access for the media where public resources are concerned, with reasonable guidelines to protect personal safety and preclude interference with response activities. The PIO must work through and seek permission from the Incident Commander before allowing media access to the emergency scene.

If conditions will not accommodate crowds of reporters, "pool" reporting may be necessary on a temporary basis. Concerning private property (a spill, for instance, on the grounds of a privately owned refinery or storage facility) reporters or their companies must negotiate their own access. The information

officer should obtain permission and legal counsel before releasing photos or video footage on private property, both for purposes of conserving legal evidence and potential violation of owners' rights.

The Daily Press Briefing: Early morning is the best part of the day for the information officer to coordinate the day's press activities and ensure that everyone receives written information and background facts. During a significant spill with a rapidly developing situation and the presence of a large number of reporters, a briefing held daily at a pre-established time (8:00 am or 8:30 am is recommended) is one of the most useful means of delivering information. This is an opportunity for the OSC and other spokespersons to brief the press and answer their questions and for other key staff members to follow up with important data. For example, if applicable, an ADF&G representative may present information on wildlife and fisheries impacts, or public health authorities may offer their findings on contamination of local subsistence foods. It is the PIO's duty to work with the OSC to prioritize the information according to importance, point out backup factual material and other sources, provide written information for distribution, and conduct the press briefing.

These press briefings may relieve the OSC and other spokespersons of some of the pressure of interviews throughout the remainder of the day, as well as free reporters to proceed with fieldwork. The early hour also means that East Coast deadlines can be met.

News Releases, Fact Sheets, and Background Papers: News releases should be reserved for announcements of major decisions, policy changes, or new developments. They must report on items that are actually news, should summarize issues clearly, and provide quotes from decision-makers that encapsulate and clarify the Unified Command's position. Distribution should be to affected communities and all response agencies in addition to the media.

Fact sheets should be prepared and updated regularly to present key data needed by the press or the public, such as amounts of oil or hazardous substance spilled or cleaned up, wildlife mortalities, and number of personnel involved in the response. Background papers should be written to amplify and clarify complex issues and the Unified Command's related actions and policies.

Desktop publishing technology is best used in the public information office from the outset of the spill for rapid reproduction of documents that communicate effectively.

Spill Bulletin: The spill bulletin, a simple but essential publication, can become a key vehicle for conveying information about the spill response. It can be produced up to several times daily by a liaison recorder, a staff member with technical spill and environmental expertise who works closely with both the information officer and the spill management team. The PIO or a liaison recorder keeps track of the changing status of the response and records the information in brief, summarized informational "bullets." The bulletin is faxed to communities, other response agencies, the Governor's Office, the ADEC Commissioner's office, appropriate federal agencies, and others who require the information. With Unified Command approval, the bulletin may also be made available to the media through the PIO.

Mapping: Oil, chemicals, or toxic gases often present increasing dangers to resources and public health because of their tendency to move after being released into the environment. The location of the spill and the changes in location are thus essential pieces of information for local residents, communities and the media. The spill information office or the JIC should obtain maps from agency technical mapping teams and make them available on a continuing basis. These maps can be attached to fact sheets or spill bulletins, if they are produced.

Designation of Spokesperson: The lead government officials or PIOs, whether federal, state or local, will be important media sources and should be prepared to answer questions on the location and severity of an incident and the type of response required to address the situation.

At the State level, the designated State spokesperson is normally the State On-Scene Coordinator (SOSC). The person filling this role will articulate the State's key policy positions and provide continuity throughout the spill response. The spokesperson should have experience in media interviews and be capable of delivering clear and frequent explanations of the State's actions during a rapidly changing emergency. Due to the workload and time constraints placed on the SOSC, the PIO will often be asked to serve as official spokesperson, addressing certain tasks and media/public engagements.

All information regarding State involvement at the spill site will be documented by staff to the SOSC either at the scene or through his/her regional office, and the SOSC or ADEC PIO will disseminate the information appropriate for release. For major incidents requiring participation of higher State executives, the ADEC division director or the ADEC Commissioner may be designated to make certain State policy announcements. The ADEC PIO will be designated by the SOSC, the responsible ADEC director, or the ADEC Commissioner. The PIO will work closely with the SOSC and ADEC Commissioner, reiterating the State's positions and policies, delivering them in writing or verbally to the news media and affected communities, and arranging appropriate interviews and press briefings to facilitate the flow of information. The PIO should contact the Alaska Department of Health and Social Services (ADHSS) PIO and/or the Emergency Response Coordinator in the earliest stages of any incident that may impact public health. ADHSS will provide a flow of accurate and timely information to public health personnel in the field and will provide information on public health issues and policy to DEC's information officer.

Federal agencies, such as the USCG or EPA, and local governments will have their respective spokespersons. The FOSC will usually fulfill this role for the federal government and will often be the point person for information on the overall spill response, yet the SOSC or ADEC PIO will remain the source for the State's position on human and environmental effects and State response activities.

The company responsible for the spill or the company's contractor may choose to inform the media of its actions in the spill response, but should defer to the SOSC and FOSC for statements about public health, dangers to resources, extent of the spill, or other issues within State or federal jurisdiction. Before releasing scientific data or other information that bear upon public concerns about the extent and nature of the spill, the spiller should first submit the information to the SOSC or FOSC for assessment of its scientific accuracy.

2310.4 – Media Logistics

Pollution incidents that generate significant media interest normally require press conferences or news briefs. These media gatherings provide an opportunity to film and ask questions of senior response officials. People arranging conferences and briefings should ensure that top officials are available and up-to-speed on any special interest areas. It is beneficial to provide a press release, statement, or press packet prior to conducting a press conference. The spokesperson(s) should approach the conference with a clear idea of the specific points to be discussed and anticipate questions that may be posed. Charts, diagrams and other visual aids serve to facilitate presentations and clarify response actions.

A schedule of the times and locations for press conferences should be published and made available to the media well in advance, whenever possible. This can be accomplished with a news advisory. It may be

beneficial to conduct press conferences near the site of a pollution incident. This presents a challenging scenario to the PIO or other public affairs personnel.

Public buildings in the area that can handle the expected media representatives should be quickly identified. This may include local federal, state, or community facilities, fire stations, police stations, or other government buildings. One alternative is to conduct a conference or briefing on scene or alongside a mobile command post. On-scene conferences or briefings must be carefully coordinated to ensure efforts to control the spill are not disrupted. For press briefings, efforts should be made to find a location that provides convenient access for federal, State, and local officials and that is large enough to accommodate the anticipated number of media personnel.

Some members of the media will request access to the spill site for photo opportunities. Direct access to private property such as facilities, vessels, or barges will remain under the control of the owner. It may be advantageous to have a USCG vessel available to tour the affected area from the waterside. When media interest exceeds the capacity of the USCG vessel, it may be necessary to form a press pool; the selection of participants is best left to members of the media. The media may also obtain their own vessel or aircraft with which to view the spill site. They will continue to be governed by any Security or Safety Zone that is in effect, unless granted specific access by the appropriate authority.

Members of the media could also approach personnel at a spill site. If possible, they should be referred to the PIO, a Unified Command representative or to the Unified Command (in that order). Agency representatives on-scene may answer questions regarding their particular roles. The rule of thumb is, if it is your job, you can talk about it; if it is not, then refer them to whoever is responsible.

Accompanying a spill of significant interest will be an increasing demand for information from public officials. Federal and State Public Affairs personnel are also responsible for fielding political inquiries as directed by the Unified Command. They should also prepare briefing materials for elected or public officials who may request information about the incident.

2320 – Joint Information Center (JIC)

Joint Information Center Description

During a major oil spill where media activity is expected to last several days, the Unified Command should task the PIO with establishing a Joint Information Center to coordinate the public affairs activities of participating agencies and parties. A Joint Information Center (JIC) is a co-located group of representatives from local, state, federal and private organizations designated to handle public information needs during an incident or event. The JIC is designed to fit naturally into the incident command structure and can be customized to reflect the size of the incident or event, expanding or contracting to meet the needs of the incident. Establishing a JIC under the Incident Command System is the most effective means of meeting information requirements and can make the difference between the public perceiving the incident to be under control or out of control.

Because of the critical nature of providing emergency information, time spent getting organized rather than responding at the time of an event can lead to confusion and a loss of public confidence. Through a JIC, agencies involved in a response can work in a cohesive manner, enabling them to “speak with one voice.” By maintaining a centralized communication facility, resources can be better managed and duplication of effort minimized. The use of a JIC allows for tracking and maintaining records and information more accurately—therefore, improving the ability to conduct post-incident assessments,

which can be used to improve crisis communication and general response activities during future incidents. JIC personnel should wear either identifying clothing or badges so they are readily identifiable by responders and members of the media and the public.

The objectives of a JIC should include:

- Developing, recommending, and executing public information plans and strategies on behalf of the Unified Command.
- Gaining and maintaining public trust and confidence
- Being the first and best source of information.
- Gathering information about the crisis.
- Ensuring the timely and coordinated release of accurate information to the public by providing a single release point of information.
- Providing multiple phone lines for incoming calls, manned by knowledgeable individuals.
- Ensuring State and federal government public affairs representatives are available to the media.
- Issuing press releases to the media and providing copies to response officials.
- Scheduling and coordinating news conferences and media briefings.
- Providing the responsible party (spiller) an opportunity to coordinate their media efforts with those of the Federal and State On-Scene Coordinators.
- Developing and maintaining a Unified Command website on the Internet to keep the public informed on the status of response activities.
- Capturing images of the crisis in video and photos that can be used by the response organization as well as the media.
- Monitoring and measuring public perception of the incident.
- Informing the Unified Command of public reaction, attitude, and needs, and advising the UC concerning public affairs issues that could affect the response.
- Ensuring the various response agencies' information personnel work together to minimize conflict.
- Facilitating control of rumors.

When possible the JIC should be kept separate from the Command Center; this provides greater control of information flow without disrupting response operations. Equipment needs for the JIC will vary depending upon the size of the incident, but most always will include the acquisition of phone lines, fax machines, copiers, computers, and printers.

Joint Information Center Planning Considerations

The following list of questions provides a starting point in determining priorities in establishing a JIC and organizing the appropriate resources to fulfill those needs:

First Steps - Initial Phase

1. **What is the status on the situation?** Obtain a situational briefing and gather accurate information such as what happened, when, where, how, and who was involved/affected? Get as many specifics and details as possible
2. **How, where, and what resources are needed to establish a JIC?** What type/size of a JIC will need to be established and where will it be located? What staffing, equipment, supplies and other resources will be needed to effectively establish and run the JIC?
3. **Who needs to be involved in the JIC?** Who are the key responding agencies? How quickly can they send a representative to participate and provide input on public communication decisions?

4. **What are the initial priorities and objectives for the JIC?** What are the initial priorities and objectives in responding to the event, how will they be accomplished, and who needs to be involved?
5. **Which JIC functions will need to be activated?** What functions and units should be activated? Do units need to be physically located together or can they function virtually via phone/web/email? Determine the best way to organize the operations, then fill out the JIC organizational chart appropriately.
6. **Are there gaps that need to be filled?** What additional information must be gathered or verified, and what additional resources will be needed?
7. **Who are the key audiences?** Identify the key audiences that need to be communicated to: affected stakeholders, public, key officials, and media? They should be communicated with regularly, so begin to set up a system to do that.
8. **What are the key messages to be communicated?** Identify no more than three key messages and determine which messages relate to which audiences best. What are the risks and the actions needed that need to be communicated about?
9. Determine if there are any issues of confidentiality due to the Health Insurance Portability and Accountability Act of 1996 (HIPPA) or criminal investigations related to the event. The members of the media often have a problem with confidentiality. However, when it comes to medical or criminal information there are things that cannot be legally disclosed. Explain this. Use good judgment.

Second Steps - Operational Phase

1. **What are the Media Relations Objectives?** Determine media relations objectives and top priorities, and assign a lead.
2. **What are the Research /Writing Objectives?** Determine content objectives and priorities; assign a lead.
3. **What are the Special Project Objectives?** Determine special projects objectives and priorities and assign a lead.
4. **Are there any new or changing priorities?** If there are changing or new priorities, what needs to be readjusted to meet those needs?
5. **What information has changed or needs to be updated?** Are there rumors and misinformation that need to be addressed? Let the news media know if there are corrections to previously released information. If new or changed information arrives, let the media and other key stakeholders know.
6. **Who are the subject matter experts?** What internal resources/expertise can be called upon?
7. **What is working and what is not working?** Assess the efficiency and effectiveness of the JIC structure and work units to determine if any changes need to be made. Take note of challenges, issues, and successes for after-action reports.
8. **What additional resources are needed to meet additional or increased demands?** If additional resources are needed, can they be acquired or must reassignments be made to the current structure to meet increased demands?

Third Steps- Demobilization Phase

1. **What key issues are still outstanding and need to be resolved?** Are there any outstanding issues that need to be addressed? Which issues need to be immediately resolved and which ones can be addressed later on the after-action plan?
2. **Do you anticipate any post-event media activity?** Assess public communication needs during a prolonged event and identify what resources can be deactivated and which ones need to remain operational.
3. **What follow-up communications need to be made?** Plan for updates or follow up communications and identify target audiences.

4. **Which units can be deactivated and which units need to stay operational?** Determine which units can be deactivated and which cannot. Develop a phase-out plan.

JIC Equipment and Supplies Considerations

1. **Will the JIC be set up as a physical organization/ location or as a virtual JIC?** First determine the set up for the JIC, whether that means physically working together in one location or working independently from separate offices.
2. **How many tables, chairs and desks/work stations will be needed for the JIC?** If you are setting up a physical JIC, what is the best way to organize the room and its functional units? Consider who needs access to what equipment, and which work units should be near each other.
3. **What communication systems will be needed for the JIC?** How many computers, laptops, printers, phones, faxes, and copiers will be need, including other operational equipment, such as projectors, white boards, etc.?
4. **What office supplies will you need?** What basic supplies will JIC staff need – notepad, message pads, pens/pencils, markers, flip charts, staplers, clips, phone books, maps, etc.?
5. **What technological equipment or technologies will be needed for the JIC?** What type of technologies will be necessary to enable the JIC to work more efficiently: email set-up, shared network drives, websites, and electronic or virtual communication systems?

2330 – Media Contacts

2330.1 – General

Each PIO will need to compile a media contact list. Reference the “Samples” section of this document for a template form for creating a media contact list and a prompt to identify the points of contact, phone numbers and Fax numbers for wire services, television, radio, and newspapers.

Federal Resources: The USCG District Public Affairs Office is ready to assist an FOSC by providing Public Affairs Specialists for media liaison and photo documentation. This office should be contacted early as the primary source for public affairs assistance. A USCG Public Information Assist Team (PIAT) is also available to FOSC's when additional personnel or expertise is required to accommodate the media. The PIAT is a specialized, self-contained, public affairs resource, which is available through the National Response Center (800) 424-8802 or the National Strike Force Coordination Center at (919) 331-6000. In the event a Joint Information Center is established, the spiller should be encouraged to provide a spokesperson to the JIC to facilitate "one stop shopping" for the media.

State Resources:

Governor's Office: A spill of any significant magnitude in Alaska, especially if it has important implications for public health or the environment, will almost certainly generate contacts with the Office of the Governor from the media and members of the public, and the Governor will likely need to comment on the spill status and response. The ADEC State Public Information Officer for the spill must establish direct contact with the Governor's press secretary at the outset of a significant incident, provide a flow of accurate and timely information to the Governor's Office, and assist in coordination among the SOSC, ADEC Commissioner, and the Governor for statements to the press. If a major spill occurs, the State PIO should coordinate the overall State approach to media relations with the Governor's press secretary. The press secretary will provide guidance on press issues within the Governor's purview.

Department of Fish & Game (ADF&G): In the event of an oil spill, ADEC should first contact the ADF&G Division of Habitat in the appropriate region, in line with existing policy. If an oil spill is significant, the

Division of Habitat will obtain the assistance of a dedicated ADF&G information officer to be a spokesperson on fish and wildlife resources.

Department of Natural Resources (ADNR): The ADNR public information staff likewise should be contacted in any incident in which State park lands or other State lands or resources under ADNR jurisdiction are affected. The ADNR agency representative will contact ADNR public information staff when State lands, waters or resources are involved in an incident.

Department of Military and Veterans Affairs/Division of Homeland Security and Emergency Management (ADMVA/ADHSEM): For participation under this plan, ADMVA/ADHSEM media contacts will be referred to the incident commander's media officer. If the spill response is part of a larger disaster, requiring the implementation of the State Emergency Operations Plan, then media contacts will be handled by the public information officials designated to act by that plan. If an emergency is declared, the DEC PIO should immediately establish contact with ADMVA/ADHSEM public information personnel for information exchange.

Core Public Information Team: When a spill occurs, the following agency individuals, as needed, will form a core group to serve as the nucleus of a State public information team: ADEC director of affected division; ADEC section chief or Area SOSC; on-scene PIO; ADEC Commissioner's Office PIO; Governor's press secretary; and information officers from ADF&G, ADHSEM, ADNR, and ADHSS.

Media Outlets

Wire Services: The Associated Press (AP), United Press International (UPI), and Reuters wire services are regularly among the first to be contacted with breaking news since these services provide electronic media and newspapers with immediate information. A PIO will be well served to make early contact with the wire services.

Name	Address	Phone/Fax	Email/Website
Associated Press	750 W 2nd Ave, Suite 102 Anchorage, AK 99501	272-7549 274-8189	https://www.apnews.com/tag/Anchorage
Reuters	3400 Purdue St Anchorage, AK 99508	349-4588/349-4589	

Television: Apart from radio, TV is the most widespread news medium and, arguably, the most powerful due to its visual impact. It is the medium by which the greatest number of people will gain information about a significant spill and formulate their feelings. Therefore, this emotionally powerful medium can be a major influence on public opinion and a key to delivering the Federal/State and local position on the impact of a spill and how people and sensitive environmental and cultural areas are being protected from further damage. The PIO should focus on using this medium in three ways:

1. Facilitate TV interviews with the OSC or other appropriate spokespersons and cooperate with stations and networks for video crews to visit spill sites, accompanying them where possible, to obtain news footage in a manner that is safe and does not interfere with the spill response.
2. For a large spill, immediately activate a professional video team to shoot broadcast-quality footage from the first days of the incident and use the material for the Unified Command's own video reports on the spill. For a small spill, request field personnel to record spill events and response operations with issued cameras.

- Use the video team's footage to produce video news releases on the most important issues and events of the spill and identify a distribution system to deliver these releases electronically to interested stations and networks. In addition, "B-roll" footage should be provided for stations to use in editing their own news pieces. The footage can be delivered statewide and nationally by satellite link. A private company may be contracted for production and editing, but the JIC may find it more expeditious to employ its own production personnel.

Name	Address	Phone/Fax	Email/Website

KAKM-TV (Ch. 7, Anc.)	3877 University Drive Anchorage, AK 99508	563-7070/273-9192	

Radio: This medium, especially public radio with its well-developed statewide and national networks, plays a more significant role in Alaska news perhaps than in other states. With public radio stations in a number of communities and efficient networking by Alaska Public Radio Network (APRN), radio represents an aggressive and professional news capability. Radio should receive equal notification and information during a spill response.

Newspapers: Print journalism often provides more in-depth coverage than television or radio and is sometimes more closely perused by decision-makers, legislators, community officials and other opinion leaders. While TV is viscerally powerful, its images are more fleeting than stories and editorials appearing in print. Thus, newspapers can have a longer-lasting effect, and, in a sense, newspapers write the "history" of an event -- at least in the public view.

Alaska Department of Environmental Conservation
Prevention and Emergency Response Program
FACT SHEET

Ninilchik River Sulfur Spill
Ninilchik, Alaska

Along the Sterling Highway, a container of sulfur fell off a transport truck and spilled along the bank into the Ninilchik River. The container held approximately 17 tons of sulfur.

Background

On Tuesday, September 16, 1997, a Lynden Transport truck traveling on the Sterling Highway transporting two containers of sulfur from the Tesoro Chemical Plant in Nikiski to Homer spilled one of the containers along the bank and into the Ninilchik River at the Ninilchik River Bridge.

The sulfur spilled down the bank and across the width of the river. The sulfur also settled a short distance downstream covering small portions of the riverbed.

Two small areas of sulfur ignited and burned. Because burning sulfur may produce irritating or toxic sulfur dioxide gases, area residents were evacuated to nearby fair grounds as a safety precaution. The fires have been extinguished, and the residents have returned to their homes.

The product spilled is dried sulfur, a by-product of desulfurization of crude oil at the Tesoro Chemical Plant in Nikiski.

Spill Investigation Activities & Sampling

The Department of Environmental Conservation is working with the trucking company, the Department of Fish and Game, Tesoro, and the Department of Health and Social Services to determine what impacts, if any, may be associated with the release of the sulfur.

Field water chemistry examinations conducted by ADF&G, upstream and downstream of the spill site, show no change in pH, water conductivity, or oxygen levels. Also, benthic organisms, rainbow trout fry, and silver salmon fry were captured immediately below the spill site by ADF&G personnel and no visual adverse impacts to the organisms were noted.

Next Steps

Sulfur spilled onto the embankment has been picked up with a vacuum truck and shovels. The tentative plan for pickup of the product in the river is to remove the large chunks by hand and follow up with an underwater vacuum system using a hose and wand connected to centrifugal pumps. Not all of the sulfur may be removed from the riverbed in order to protect fish spawning areas.

What is SULFUR?

Elemental SULFUR is largely extracted from petroleum. It is also used as an ingredient in insecticides, over the counter skin medications, and soil stabilizers. Sulfur – in its elemental form – is an odorless, flammable, yellow, translucent solid. Sulfur makes up 15% of the inner core of the earth and 0.052% of the earth's crust. Traces of impurity may give off a rotten egg odor to the sulfur compound.

What happens when it is spilled?

Sulfur will not mix with water. So, when spilled onto soil, it cannot be transported downward into the ground water table, and when spilled into a water body, it is likely to thicken and sink to the bottom and not dissolve into the water. Sulfur is also oxidized by microbial species in soils and sediments. Plants are able to utilize the oxidized forms of sulfur.

Potential Health Risks Examined

Inhalation of sulfur dust can cause eye irritation, respiratory tract irritation, inflammation of the nasal mucosa and possibly increased nasal secretions. Sulfur is not particularly toxic when ingested. The major health risk in handling sulfur is ignition and the potential to produce toxic sulfur dioxide and hydrogen sulfide gas.

Ecological Risks

Sulfur is a natural component of river water and seawater. In its sulfate state, it is present in sea water at about 2,700 parts per million (ppm) and at about 11 ppm in river water. Sulfur does not bioaccumulate or build up in fish, clams or oysters.

Sulfur is dangerous to aquatic life when extremely high concentrations are suspended into the water column. Low levels of sulfur settled into the sediment do not appear to be dangerous to the aquatic environment.

Information about the Prevention and Emergency Response Program

DEC's Prevention and Emergency Response Program is responsible for all ADEC prevention and emergency response activities related to oil and hazardous substance releases statewide. Its objectives are to ensure the safety of all persons involved in an incident, and to protect the public health and the environment.

The Alaska Legislature created the Oil and Hazardous Substance Release Response Fund to enable the state and local governments to cover the costs of oversight and cleanup. These costs are in turn recovered from the responsible party as mandated by state law.

Additional Human Health Toxicity

Routes of Entry: inhalation, skin, eyes, ingestion.

Non-Cancer Causing:

According to the National Toxicology Program (NTP), sulfur is not listed as a carcinogen (cancer causing agent).

Acute (short term) Health Effects:

Over exposure can cause reddening of the eyes and skin. Inhalation of dusts can be irritating to the nose and throat.

Chronic (long-term) Health Effects:

Prolonged skin contact can cause the development of allergic reactions.

OSHA:

The Occupational Safety and Health Administration has not established a permissible exposure limit (PEL) for sulfur.

ACGIH:

The ACGIH has not established a threshold limit value (TLV) for sulfur.

Additional Ecological Toxicity Information

Aquatic toxicity:

Freshwater toxicology of sulfur on fish is as follows:

- 16,000 ppm for 5 hr. on goldfish resulted in 100% mortality under turbid water conditions;
- 10,000 ppm for 96 hr. on mosquito fish resulted in adverse effects in turbid water conditions;
- 1,600 ppm for 3.5 to 5.25 hr. on goldfish provide fatal under colloidal sulfur in tap water.
- 200,000 ppm for <1 hr. on goldfish proved fatal under colloidal conditions.

Note: colloidal conditions means that the sulfur was kept suspended in the water.

PIPELINE SPILL GETS RESPONSE BY ALYESKA, ADEC, AND STATE-FEDERAL JOINT PIPELINE OFFICE

Spill response personnel have formed an incident command system (ICS) in response to an underground spill at Pump Station 10 on the Alyeska Pipeline. The spill has caused manager-company Alyeska Pipeline Service Company to reduce the flow through the pipeline by approximately one-half (from 1.4 million barrels to 700,000 barrels per day) while excavation and repairs are made. The spill is located about 150 miles south of Fairbanks along the Richardson Highway.

It was reported that Alyeska maintenance personnel discovered the spill late Saturday. The company implemented an ICS to address the spill. The Department of Environmental Conservation (DEC) personnel joined the ICS on-site at Pump Station 10 to monitor, assist and investigate the spill and response.

Alyeska Pipeline pumped crude oil from storage tanks at Pump Station 10 to make storage available in case the line needs to be evacuated for repairs.

The cause and volume of the spill were not known today, but Alyeska had pumped about 100 gallons from two metal culverts used for accessing flow transducers on the pipeline. The company estimated that crude oil is seeping into the culverts at a rate of about six to eight gallons per hour.

Alyeska organized four task forces to address the spill. They will excavate in the area around "check valve 92," excavate near the metal culvert pipes to locate the leading edge of the spill, establish a contaminated soil stockpile, and provide decontamination of field equipment.

DEC staff are monitoring initial response actions and reviewing cleanup plans, and will review a waste management plan for the response. DEC is working with Alyeska and with the State-Federal Joint Pipeline Office to respond to the spill.

Media Advisory

Date: April 6, 2009
Contact: Joint Information Center
Phone: (907) 301.2074

Unified Command to hold press briefing at the USGS Science Center Monday

**Editor's Note: A press briefing will be held at the USGS Alaska Science Center at 1:00 p.m. to provide an update on recent volcano activity and the Drift River Terminal. The media is encouraged to attend. Please address questions about the briefing to the Joint Information Center (907) 301.2074 Mob.*

To call into the press briefing please dial 1 (866) 744.4861 and enter code 3986553 followed by the pound sign.

The USGS Alaska Science Center (previously referred to as the Alaska Volcano Observatory) is located on the Alaska Pacific University Campus at 4210 University Drive, Anchorage, Alaska.

ANCHORAGE, Alaska - The Unified Command, Drift River Terminal Coordination, will be holding a press briefing today to provide an update on the Drift River event. USGS staff attached to the Alaska Volcano Observatory will provide an update on Mt. Redoubt's activity.

There have been no injuries to the crews at the facility and there has been no release of oil into the environment.

Approximately 60 percent of the 6.3 million gallons (148,000 barrels) of crude oil stored at the facility has been transferred to the Seabulk Arctic. About 840,000 gallons (20,000 barrels) of water from Cook Inlet using the Seabulk Arctic is being pushed back into the two oil tanks in service to prevent them from becoming buoyant.

Eleven Cook Inlet Pipe Line Company employees remain at the facility and two are located on the Christy Lee platform. Once the transfers are complete the employees will complete some housekeeping and security tasks around the facility prior to leaving. Operations at the terminal will be temporarily suspended once today's transfer is complete until the volcano's eruptive cycle enters a period of continued calm.

Cook Inlet Pipe Line Company and their upstream customers are considering the impacts of temporarily suspending operations and the future of production on the Western Cook Inlet. Questions regarding production and commerce can be addressed to Chevron, Pacific Energy Resources and the Dept. of Labor. Appropriate contacts with in those organizations are forth coming.

For more information please visit: the Coast Guard District 17 website at <http://www.uscgalaska.com> or the State of Alaska Dept. of Environmental Conservation Site at http://www.dec.state.ak.us/spar/perp/response/sum_fy09/090324201/090324201_index.htm.

2400 – LIAISON

Liaison Officers (LOFR) -- point of contact for affected communities, interest groups that do not have jurisdictional authority, landowners, leaseholders, RCACs, government agencies, and other groups of interested parties. Several Liaison Officers may be designated, depending on the level of coordination required. The LOFR coordinates with the Regional Stakeholder Committee, if one is activated.

2410 – Investigators

The following are helpful resources for understanding and implementing the investigator role:

- [The USCG Incident Management Handbook](#)
- [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response.](#)

2420 – Federal/State/Local Trustees

For incidents with significant effects or the potential for significant effects on Federal trust resources (e.g., critical habitat for threatened and endangered species), Federal trustees will have the option of providing input directly to the Unified Command to ensure information on these resources is available, and used appropriately, in decision making. This representative(s) would provide guidance on response and protection strategies commensurate with the special status of the affected or threatened lands or resources.

2430 – Agency Representatives

The following are helpful resources for identifying and implementing the agency representative (AREP) role:

- [The USCG Incident Management Handbook](#)
- [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response.](#)

2440 – Stakeholders

Reference the Regional Contingency Plan for additional guidance on stakeholders.

2440.1 – Regional Stakeholder Committee

A Regional Stakeholder Committee (RSC) may be activated for significant incidents to advise the UC on incident objectives and community concerns. The RSC will not play a direct role in setting incident priorities or allocating resources, however the RSC can provide the UC (usually through the Liaison Officer) with recommendations or comments on incident priorities, objectives, and the incident action plan. The RSC is not directly involved in tactical operations, though some of its members may be. Each RSC will be facilitated by a chairperson elected by the RSC members. RSC composition may vary from incident-to-incident, phase-to-phase and may include Regional Citizens Advisory Councils (RCACs), community emergency coordinators, local or tribal government representatives, local or private landowners and leaseholders, Native organizations, non-profit and volunteer organizations, and other stakeholder groups affected by the spill. Agencies/organizations that are functioning as part of the overall ICS response structure should not provide redundant representation on the RSC.

The RSC's role is to convey to the Unified Command information relating to the authority, concerns, and expertise of its members. The RSC recommends to the Unified Command overall objectives and priorities and reviews Incident Action Plans. An RSC is normally activated for significant incidents that involve resources under the jurisdiction of several agencies.

RSC activities will be coordinated by the Liaison Officer. RSC discussions will be documented, and recommendations or dissenting opinions expressed outside of the RSC meetings with the Unified Command will be communicated to the Unified Command through the Liaison Officer. The RSC will be chaired initially by the Liaison Officer. After convening, the RSC will then elect its own chair.

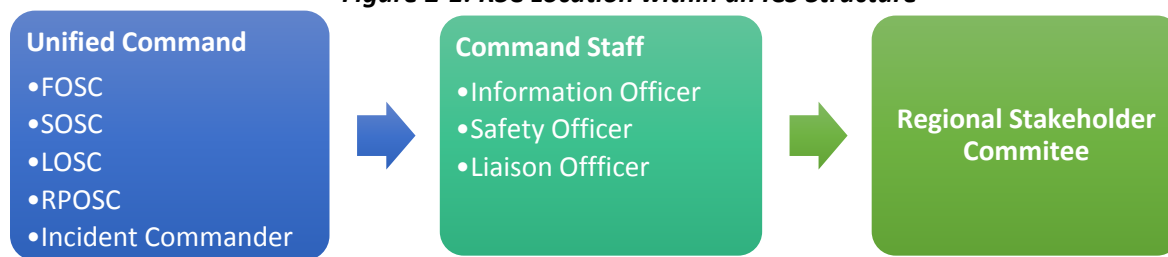

During incidents where there is no FOSC, federal agencies with jurisdictional responsibilities for resources at risk could participate as members of the RSC, thus retaining their input on response operations. However, the preferred approach is to include these agencies as part of the overall ICS structure.

RSC Chair: In cases where the RSC Chairperson has not been predesignated, RSCs may be chaired initially by the Liaison Officer. The RSC will then elect its own chair. For spills affecting Cook Inlet, RSC Chair may initially be filled by designated CIRCAC member until the assembled RSC elects a Chair.

Senior Leaders of Impacted Communities: An alternative to the RSC for communities affected by a major spill may include the establishment of a group consisting of senior leaders of impacted communities. The group should have direct access to the ADEC Commissioner or his/her representative.

The figure below provides the general location of the RSC in relation to the Unified Command organizational structure and suggested/potential membership of the RSC. Membership on the RSC is dependent upon the location of the incident and the interests or jurisdiction of the affected communities, landowners, and special interest groups. Government agencies will not normally use the RSC to provide input to the Unified Command. Federal agency personnel will participate within the ICS structure under the leadership of the FOSC; state personnel will do so under the guidance of the SOSC. During an incident in which no FOSC is taking part, federal agencies with jurisdictional responsibilities for resources at risk could participate as a member of the RSC, thus retaining a channel for input on containment, oversight, and cleanup. The preferred approach is to include these agencies as part of the overall ICS structure.

Figure 2-1: RSC Location within an ICS Structure

2440.1.1 – Regional Stakeholder committee Process

Earlier in this plan, it describe the roles of the local and Tribal governments and other potential stakeholders in spill response and the requirement that they be kept closely involved. The Regional Stakeholder Committee (RSC) is intended to fulfill that purpose.

General Guidelines for the RSC:

- The term “stakeholder” is so broadly defined, any system dealing with stakeholder issues and information should be designed to accept input from anyone in the spill-affected region.
- Regional and local Tribal leaders and elected officials are the primary representatives for all stakeholders and offer the best access to ensure full local representation.

- There are stakeholders that transcend municipal or Tribal boundaries. There are also non-governmental groups that may be represented by an entity such as the Cook Inlet Regional Citizens Advisory Council (CIRCAC). Other stakeholders will have the option of going through an RCAC or their local official.
- The members of the RSC need to be empowered by their constituents to make decisions and prioritize.
- The RSC members need frequent contact with their constituents. Frequent public meetings chaired by the RSC members for their respective communities are critical to ensuring all are heard.
- The RSC should have direct access to the Unified Command. Their input needs to be considered during the planning cycle. However, the Unified Command can commit limited time (usually less than 1 hour per day) to directly deal with the RSC.
- Many of the RSC issues can be addressed by effective communications with the Unified Command through a process that is incorporated into the planning cycle.
- Support of the RSC is a Unified Command responsibility and can be shown by supporting local meetings, as well as fostering communication and coordination to help organize RSC input, routing it to the proper channels in the response organization or the Unified Command.

Regional Stakeholder Committee Coordinators: RSC coordinators in the Unified Command would support RSC members and the Community Liaisons. Coordinators could include representatives from the Unified Command (USCG or EPA, ADEC, RP), and the RCAC (if the RCAC is involved). Each coordinator will administratively work with his or her respective organization.

Regional Stakeholder Committee Membership: RSC membership consists of the Tribal council leaders and mayors/city councils, or their designees. Native Corporations would provide a representative as a third member from a convenient community of their choice. If a community leader chooses to be represented by an RCAC designee, the respective RCAC Board member may be a logical choice, if an RCAC exists for the area. These community leaders will appoint a representative to be located with the IMT who will be that community's spokesperson to the Unified Command.

Where an RCAC exists, the RCAC will be invited to appoint a representative on the RSC to collect input from:

- Alaska State Chamber of Commerce
- Alaska Wilderness Recreation and Tourism Association
- Oil Spill Region Environmental Coalition
- Aquaculture Corporations
- Commercial Fishing Organizations
- Other individuals not using their local representative

Environmental groups may either input their information through the nearest community RSC representative or the RCAC representative.

1. Information Flow Process

An organization that best meets the criteria and constraints is one that directly connects each day with the Unified Command. The response organization must be ready and able to accept and consider the input from the Regional Stakeholder Committee.

The Unified Command will provide the RSC members and their representatives with:

- The Incident Action Plan (IAP) on the same day it is approved.

- All JIC produced information.
- Responses to information or questions provided by the RSC.
- Direct access to the Unified Command on a regular basis.
- Support to the RSC members and their IMT representatives in the conduct of their responsibilities.

Using their representatives, the RSC provides the Unified Command the following information obtained during daily meetings with their constituents:

- *Issues of local interest and concern:* Of particular concern to the Unified Command are issues of an immediate nature. These should be highlighted.
- *Resources:*
 - Available to assist with response activities:
 - These include: workers and support personnel; communications equipment or systems; hotel and berthing facilities; heavy equipment; aircraft support; harbor facilities; machine shops and repair facilities for vessels and equipment.
 - Needed in the local area.
 - For example: spill response equipment (booms, skimmers, etc.), staples, and food needed to replace lost subsistence sources or support a large influx of workers. Of particular concern to the Unified Command are resource needs of an immediate nature. These should be highlighted.
- *Cleanup assistance:*
 - Available to assist with response activities.
 - These include: personnel with special expertise; and unique spill response equipment. The UC would be particularly interested in contacting personnel with local knowledge to assist with collection tactics, wildlife behavior and safe navigation.
 - Needed in the local area to conduct response operations. Of particular concern to the Unified Command are cleanup needs of an immediate nature and sensitive area identification. These should be highlighted.

There will be a need for extensive communication between the RSC coordinators and the representatives of the RSC, as well as between RSC members, as information is compiled and questions are answered. Additionally, the RSC coordinators will assemble and deliver information and requests to the proper sections of the incident management team.

The RSC representatives will deliver the information to the Unified Command during an afternoon meeting. If members of the Unified Command must leave before the meeting is complete, or cannot make the meeting, the RSC coordinators will represent their respective part of the UC until the discussion is over.

2. Timeline of Activities

A cycle of work that spans the interface between two adjacent operational periods allows an opportunity for constituent contact; issue reconciliation / prioritization; and optimization of the direct UC contact time. A recommended work cycle is provided as follows:

<i>Time Period</i>	<i>Activity</i>
When approved	RSC coordinators distribute to RSC members and their representatives: the IAP, information from the JIC, and any responses to previously submitted questions or concerns.

Late afternoon or other time as determined within the community	Public meetings or other locally determined method that allows individual stakeholder input to the RSC members for that community. Information from this process is faxed or emailed to the RSC representatives and the coordinators prior to midnight.
AM next day	RSC coordinators work with the RSC representatives to define and resolve issues and answer questions raised by constituents. The coordinators help the representatives prioritize issues, route information to the proper staffs in the IMT and prepare the representatives and the UC for the afternoon meeting. This work will provide rapid feedback to the communities, timely input to the planning cycle for the IAP, and a reduction in the volume of issues to be presented directly to the UC.
PM	The coordinators brief and prepare the UC for the RSC meeting. The meeting with the UC will last approximately 1 hr.

3. Responsibilities:

Regional Stakeholder Committee Members

- Establish a system that allows local stakeholders to provide input. Local stakeholders can be landowners and resource users of any description. The goal is to include all local interested parties to ensure ideas and concerns are heard. After the first meeting, the system would provide feedback and answers received from the UC.
- Assemble and prioritize the input into the three areas: issues; resources; and cleanup assistance.
- Ensure their representative receives the community input.

RSC Representatives in Communities

- Receive community information from their RSC member.
- Work with the coordinators to clarify issues and participate in the UC meeting.

RSC Coordinators - The coordinators are located at the emergency operations center or incident command post.

- They support the RSC members and representatives to ensure their needs, concerns and information are passed to the appropriate part of the IMT organization.
- Issues and information provided by the RSC is inserted into the planning cycle for consideration.
- The coordinators highlight issues to the Unified Command to ensure appropriate attention is given to critical matters.

Liaison Officer - The liaison officer will assist the RSC members with the performance of their duties by obtaining resources and coordinating, as necessary.

<i>Type of Information</i>	Coordinators Route to:
Issues of concern	JIC, Unified Command and the Operations and Planning Sections
Resources available	Logistics Section
Resources needed	Operations, Planning and Logistics Sections
Resources needed - urgent	Operations, Logistics Sections
Cleanup assistance available	Operations, Planning and Logistics Sections
Cleanup assistance needed	Operations, Planning and Logistics Sections

Urgent cleanup assistance needed	Operations and Logistics Sections
Sensitive area information	Environmental Unit
Questions on cleanup techniques	JIC, Environmental Unit, Operations Section

2440.1.2 – Regional Citizens’ Advisory Council

The Oil Pollution Act of 1990 (OPA 90) established two RCACs in Alaska: the Prince William Sound RCAC and the Cook Inlet RCAC. The RCACs are independent, non-profit organizations that monitor and advise on oil industry programs to include areas such as spill prevention and response, tanker safety, and environmental impact assessments. During a spill response, RCACs monitor on- water activities, observe, and verify spill response and cleanup efforts. RCACs inform local community members and other concerned groups about response activities and provide information on local concerns and priorities to the Unified Command in order to facilitate operational decisions.

Regional Citizens Advisory Council within Arctic and Western Alaska Area:

Agency	Location	Phone	Alt. Phone
Cook Inlet RCAC	Kenai	283-7222	800-652-7222

The Cook Inlet Regional Citizens Advisory Council (RCAC) is a local citizens group with an Oil Pollution Act of 1990-mandated role in Cook Inlet spill response activities. In this role, the RCAC participates with the incident management team at the emergency operations center and monitors on-water activities during a spill. The RCAC has four primary tasks to perform during a spill: observe, verify, inform, and advise. Cook Inlet RCAC provides local knowledge and technical expertise within the ICS structure (e.g., as part of the Operations, Planning Sections and the Joint Information Center). The RCAC also provides information on local knowledge and concerns to incident commanders that can prove valuable to operational decisions. The RCAC is a resource for the Unified Command and participates in the Regional Stakeholder Committee when it is established and functioning for a spill response.

Specific responsibilities of the RCAC include:

- Providing a voice for local communities and citizens in the policies and decisions that affect them.
- Advising the oil industry and the public on oil spill prevention and response, and ways to mitigate the environmental impact of terminal, offshore oil facilities, and tanker operations.
- Monitoring terminal, tanker, and offshore oil facilities operations and implementation of spill prevention and response plans.
- Increasing public awareness of private oil industry's current capabilities in spill prevention and response, and the environmental impacts of oil transportation.
- Fostering long-term partnership between industry, government and local communities.
- Conducting independent research.
- Participating in, monitoring, and critiquing actual spill responses, spill drills, deployment exercises, and spill simulations conducted by industry. The RCACs also assist industry and regulatory agencies in drill planning and post-drill evaluations.
- Participating in the Regional Stakeholder Committee.
- Preparing and maintaining an RCAC Emergency Response Plan outlining the Council's role and operating procedures in the event of a major spill.

2440.2 – Environmental

The following website, “Alaska Citizens’ Workshop” provides a listing of environmental interest groups in the State of Alaska: <http://www.alaska.net/~jrc/alaska.html>

2440.3 – Economic (Port operators, tourist hotels, etc.)

Reference the [Community Profiles](#) for community specific economic stakeholders

2440.4 – Political (local, state, etc.) – TBD

2440.4.1 – Tribal

Reference [Section 9230](#) for federally recognized Tribe information.

2440.5 – Native Organizations

[Reference Section 9230](#) for Native Corporation information.

2450 – Natural Resource Trustees

A list of the natural resource trustee emergency contacts is maintained on the [Alaska Regional Response Team website](#), under “Members and Contacts.”

2460 – Natural Resource Damage Assessment (NRDA)

NRDA activities, which are performed under the direction of natural resource trustees, typically are conducted concurrently with response activities, which are under the direction of the Unified Command. If necessary, trustees will make a NRDA representative available to the Unified Command at the incident command post to coordinate NRDA field actions with response activities. The role of this NRDA liaison is to provide a linkage between NRDA activities being conducted by trustee representatives and response activities being conducted by Federal, State, Local, and RP OSCs.

2500 – RESERVED

2600 – RESERVED

2700 – RESERVED

2800 – RESERVED

2900 – RESERVED FOR AREA/DISTRICT

3000 – OPERATIONS

3100 – OPERATIONS SECTION ORGANIZATION

The number and types of branches and divisions/groups are situation-dependent. For a major oil or hazardous substance release, the USCG has pre-designated branches and divisions/groups with formal tasking and objectives. Specific guidelines for these staff positions are included in [The USCG Incident Management Handbook](#). [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response](#) identifies the key functions within the Operations Section, but does not pre-designate branches, divisions, or groups. The nature and gravity of the incident will dictate the desired response structure to be established within the Operations Section.

3110 – Organization Options

[The USCG Incident Management Handbook](#) is an excellent reference for hazard-specific organization options for the Operations Section.

3120 – Considerations for Building the Operations Section - TBD

3200 – RECOVERY AND PROTECTION

3210 – Protection

For protection techniques and operations, reference the following:

- [The Alaska Department of Environmental Conservation \(ADEC\) Spill Tactics for Alaska Responders \(STAR\) Manual](#)
- [The Alaska Clean Seas Technical Manual](#)

3220 – On-Water Recovery

For on-water recovery techniques and operations, reference the following:

- [The Alaska Department of Environmental Conservation \(ADEC\) Spill Tactics for Alaska Responders \(STAR\) Manual](#)
- [The Alaska Clean Seas Technical Manual](#)

3230 – Shoreside Recovery

3230.1 – Shoreline Cleanup Options

Shoreline cleanup strategies are diverse and will depend on a number of factors including shoreline type, spilled oil properties, extent of contamination, prevailing weather conditions, tidal fluctuations, sea conditions, accessibility by shoreline cleanup crews and equipment, etc. The Unified Command will determine the best available options for cleaning impacted shorelines based upon these factors.

There are several worthwhile documents that can be used as reference documents for shoreline assessment and cleanup. These include the following:

- “The Arctic SCAT Manual, A Field Guide to the Documentation of Oiled Shorelines in Arctic Regions,” Environmental Canada (July 2004)
- “Alaska Clean Seas Technical Manual Volume 1; Tactical Descriptions,” Alaska Clean Seas (2016)
- “Alaska Shoreline Countermeasures Manual,” NOAA (April 1994)
- “Circumpolar Field Guide for Oil Spill Response in Arctic Waters,” Environment Canada (1998)
- “Guide to Oil Spill Response in Snow and Ice Conditions in the Arctic,” EPPR (2015)

- "Tundra Treatment Guidelines, A Manual for Treating Oil and Hazardous Substance Spills to Tundra 3rd Edition," ADEC (2010).
- "Shoreline Assessment Job Aid," NOAA, (2007)
- "Characteristic Coastal Habitats - Choosing Spill Response Alternatives," NOAA, (2017)
- "Shoreline Assessment Manual," 4th edition, NOAA (August, 2013)
- Arctic Shoreline Clean-up Assessment Technique (SCAT) Manual, EPPR, 2004. Additionally, this website provides information on useful spill response data as noted below.
http://www.asgdc.state.ak.us/maps/cplans/geographic_zones.html
- Environmental Sensitivity Index (ESI) Maps (which identify shoreline types). ESI Maps (for coastal areas of the State) have been developed for all geographic zones within this Arctic and Western Alaska.
- Land Management Maps
- [Geographic Response Strategies](#)
- Most Environmentally Sensitive Area (MESA) Maps
- Biologically Sensitive Area Maps
- Aquatic Farms
- Regional Maps (USGS Quadrangles, NOAA Nautical Maps)
- Alaska Oceanographic Circulation Diagrams and Graphics

3230.2 – Pre-Beach Cleanup - TBD

3230.3 – Storage

[The Alaska Department of Environmental Conservation \(ADEC\) Spill Tactics for Alaska Responders \(STAR\) Manual](#) provides guidance for land and marine based storage options.

3240 – Disposal

3240.1 – Waste Management and Temporary Storage Options

The term "waste" is used throughout this document. It is used for identifying the types of materials that are generated as the result of a spill and spill cleanup, and is not used to define these materials for purposes of state and federal solid waste and hazardous waste statutes and regulations. To formally confirm that these materials are not considered wastes in the regulatory use of that term and to optimize the management of these materials in a safe and environmentally responsible manner (e.g., recycling of recovered crude oil), the following definition is used for purposes of this document: "waste" means materials that are generated as a direct result (e.g., recovered crude oil) and the indirect result (e.g., refuse, sewage, and hazardous wastes) of an oil spill; "waste" for these purposes does not mean "solid waste" as defined by Alaska (AS 46.03.900(5) and 18 AAC 60.910(53) and federal (42 U.S.C. § 6903(27)) laws.

WASTE STREAM IDENTIFICATION NUMBERS

Drums	206
HAZARDOUS WASTES	301
*Note: The numbering system depicted here is one of several possible methods to categorize waste materials to facilitate tracking and eventual disposal.	

1. PROCEDURES FOR TRANSPORTATION, STORAGE, AND DISPOSAL:

Temporary waste storage areas will be strategically selected and located as points of accumulation and temporary storage for oil spill related wastes. These temporary storage areas can be located at recovery sites, or they may take the form of longer term storage at more permanent facilities. Waste generated by response efforts will be stored at these areas pending waste characterization, final identification of disposal options, and placement of contractual arrangements with approved disposal facilities. Temporary waste storage areas must be approved by ADEC and the land resource trustee. It will be the responsibility of the RP to provide manpower and equipment required to transfer the wastes from the arena of operations to the storage areas and to fully operate these areas.

At the storage areas, wastes will be segregated into waste streams and stored in appropriate containers. In general, waste streams will not be mixed unless specifically directed by the Environmental Unit Leader. Later in the response effort, wastes may be forwarded under manifest directly from the point of generation to the disposal facility without the need for temporary storage.

Liquid Wastes: Liquid wastes recovered through skimming or washing operations will be accumulated in barges, portable tanks, bladders, drums, or other approved means and held pending waste classification and characterization. Each container must be labeled as to contents and provided with an identification number for tracking and accounting purposes. In most cases, water will be decanted (with State approval) to reduce the volumes of liquid wastes. Different classes of liquid wastes should not be mixed in the same containers without approval of the disposal officer.

If the recovered oil has not undergone significant weathering or emulsification and is free of foreign material, it can be transported to a refinery or oil terminal as a product rather than a waste. Oil that cannot be recovered in this way will be deemed a waste oil and subject to additional testing and handling requirements.

On vessels used for decontamination purposes, all oily wash water should be segregated from other wastes and stored on board the vessel for future transport to an identified disposal facility.

Oily water collected at boat cleaning stations should be segregated into the following four categories:

- Bilge waters
- Bottom liquids from cargo compartments or holds
- Oily deck and hull wash waters

- Oily hold wash waters

Oily wash waters from the cleaning of gear, boom, and equipment should also be segregated and stored separately. Used oil from gear and maintenance operations should not be mixed with any other liquids, but collected and stored in marked containers. Other liquid wastes, like hydraulic fluids, antifreeze and contaminated fuels, also should not be mixed, but stored in 55-gallon drums and marked as to their contents.

All unidentified liquid wastes should be labeled as such, segregated, and handled according to hazardous waste management standards (40 CFR 261) pending laboratory analysis for RCRA hazardous waste characteristics.

Solid Wastes:

Solid wastes should be double bagged and placed in portable dumpsters or shipping vans and transported to the temporary storage areas. Basic separation of like wastes should take place at this level. Clear, color-coded plastic bags may be used to segregate solid wastes for different disposal options. Solid waste that is too large for plastic bags will be segregated into properly marked dumpsters or shipping vans. Large spills may require a dedicated solid waste storage barge.

All dumpsters, shipping vans, or other means for storage of oily solid wastes must be lined with plastic sheeting prior to use. To control free liquid accumulation within the containers, an inner lining of oil and water absorbing fabric will be used. Additional granular sorbent material should be added as required to eliminate free liquids. For responses where oily debris is extensive and likely to accumulate rapidly, debris may need to be piled in vacant storage yards with a drainage system to collect any runoff, or in lined earth pits.

Oily PVC waste materials should be bagged and tagged to show contents. These bags should be segregated from other waste streams and transported to a storage area

Bird and animal carcasses should be bagged, tagged, and segregated. Tags should include location of the recovery. Bird and animal carcasses will be handled as directed by the appropriate authority.

Non-Oily Wastes:

Non-oily waste (scrap materials, construction materials, etc.) and domestic garbage and refuse should be collected and segregated (according to the particular requirements of municipal or private waste process and disposal facilities) to prevent oil contamination and transported to storage or final disposal site.

2. WASTE HANDLING AND LABELING:

Proper waste handling, manifesting, custody transfer and labeling are important for the proper movement and documentation of all waste materials generated in an oil spill response. Wastes must be segregated according to the various types and must not be mixed. All segregated wastes will be properly labeled showing the type of waste in each container. For all unidentified wastes, they need to be labeled as such and segregated from the other wastes. All unidentified wastes/oils will be assumed hazardous until sample results are available. If a waste turns out to be hazardous, it will be handled and treated in accordance with current hazardous waste regulations.

Records: All waste oils, regardless of type, must be managed by a complete set of records. These records should show the following:

- Where the waste was recovered,
- The type of waste,
- Approximate volume,
- Date collected,
- Date transported to staging or disposal site,
- Date received at temporary storage area or disposal site,
- The number of containers shipped,
- The number of containers received,
- The date, location and method of final disposal.

To aid in the implementation of the records requirements, the following procedures are recommended:

1. Waste management activities should be conducted as secure storage areas set up at strategic locations.
2. Each load of waste departing the point of generation should be inspected and assigned to an internal waste stream matrix and inventory record.
3. A waste tracking form should be completed for each load of waste. Information required on this form includes date and time, transporter name, vessel or truck number, description of waste and generating process, the assigned waste stream number, and destination of the waste.
4. Waste moved to off-site treatment or disposal facilities are transported under the appropriate manifest with copies retained.
5. Once each day, a "waste management summary report" will be completed documenting the following daily and cumulative totals for each waste stream:
 - a. Waste received
 - b. Waste stored on site
 - c. Waste stored off site
 - d. Waste disposed by disposal facility

3240.2 – Disposal Options

The RP will be responsible for developing a waste disposal plan that provides the necessary logistical and procedural information for the transfer of wastes to disposal facilities. The disposal plan must comply with existing laws and regulations. Oversight of the waste disposal plan will normally be the responsibility of the ADEC.

An ADEC solid waste permit is required. Consult with ADEC on the landfill status and the current information on the adequacy of landfills. Currently, no approved hazardous waste disposal sites exist in Alaska. Municipal landfills in Alaska either no longer accept oily wastes or accept only lightly oiled soils.

State regulation 18 AAC 75.130 requires that the final disposal of a hazardous substance including oil, be approved by ADEC. Oil spill reporting regulations 18 AAC 75.100 require that disposal information be provided within the oil spill report.

1. Short Term Management and Disposal Options for Liquid Wastes:

If a spill occurs, both oil and non-oily liquid wastes will be generated or collected during cleanup. This section describes short-term management and disposal options for oil and non-oily liquid wastes, including domestic wastewaters.

OILY LIQUIDS:

Recovered oil and oily wastewater from spill-related activities will be stored on board tank vessels, in portable tanks, tank trucks, or in approved shore-side tanks where primary oil/water separation may occur. With State approval, on-site decanting may be allowed. After primary oil/water separation, one of the following disposal options will be used:

- Tender of recovered oil to the contracting vessel for offshore treatment;
- Transportation of recovered oil to a refinery or oil terminal for re-use as a product;
- Barging oily water to the continental U.S. for additional treatment or disposal, unless the spill fluid emanated from oil production facilities and can be recycled or disposed of at the original facility; or
- Barging heavily weathered and emulsified oils to the continental U.S. for treatment, additional oil recovery, and wastewater and solids disposal in a commercial waste management facility. Treatment facilities for these options are described below.

Onshore Treatment Facilities:

Crude oil recovered soon after a spill will generally be suitable for reclamation by a production facility or refinery. Because the chemical make-up of spilled oil changes as it weathers, it is less likely that oil collected during a long-term cleanup operation can be reclaimed. Oil that is emulsified, weathered and mixed with debris from the sea or from beach cleaning operations is a mixture of liquids and solids and requires special handling and treatment prior to disposal. There are currently no appropriate disposal options in Alaska for these emulsified wastes. Therefore, they must be stored on barges and shipped to appropriate waste handling facilities in the continental U.S. for treatment.

Oily wastewater, if associated with oil production or terminal facilities, can be treated and disposed of at those facilities (such as the Ballast Water Treatment Plant at the Valdez Marine Terminal) with the approval of EPA and ADEC. Laboratory analysis of these wastewaters may be necessary so that contaminants do not interfere with the treatment process. If particular oily wastewaters cannot be treated because of incompatible contaminants or inadequate plant capacity, those wastewaters will be taken to alternate treatment facilities (e.g., the tanker owner's refinery in the continental U.S. or a permitted bulk receiving facility). For certain wastewaters, physical chemical treatment methods (e.g., air stripping or granular activated carbon) may be preferred over biological treatment.

Contaminated wastewaters will require sampling, analysis, and possible pre-treatment before potential disposal in a municipal sewage treatment facility. EPA, ADEC, and municipal approval may be required. Any discharge into a municipal sewage system must meet EPA pre-treatment standards. If analysis indicates that wastewaters are hazardous, they will be shipped to a disposal facility in the continental U.S.

Offshore Treatment Facilities:

The objective of any onboard treatment will be to reduce the water content of the liquid wastes or recovered product collected and transported by the vessel, thereby increasing the vessel's storage capacity. It is reasonable to assume that some primary phase separation could take place in the vessels being loaded with oily wastewaters. The accumulated water could be extracted, treated and, after the appropriate permits are obtained, discharged overboard.

Treatment facilities to be considered include:

- Screw pumps (very suitable for low and highly viscous liquids)
- Centrifuges (operation not affected by vessel movement)
- Gravel filters (operation not significantly affected by vessel movement)

- Dissolved air flotation (DAF) unit (effective in removing low concentrations of oil, but its operation can be affected by vessel movement)

The performance of the onboard treatment facilities can be enhanced by the use of emulsion breakers and flocculation agents. Care should be exercised to ensure that they do not become a source of pollution. Unless the tanker or vessel is anchored in a sheltered area, treatment can be impacted by inclement weather.

In-State Resources for Waste Treatment and Recycling:

There are several facilities in the state that treat oily wastes or related materials. In general, however, operational or permit requirements limit the facilities' ability to handle recovered liquids.

Alaska Pollution Control is an oil recycling facility located in Palmer. The plant is currently accepting a variety of spilled and recycled refinery products, including lubricating oil, gasoline, diesel, and fuel oil. The products must be less than 1000 ppm total halogens and must not be hazardous waste by definition. Exact requirements must be verified prior to use of the facility, and the blended products must meet specifications for heating value. The products are processed and sold for use as industrial fuel. The plant does not accept crude oil for operational reasons, but does accept 10,000 to 20,000 gallons of water per week from spills and tank clean-outs. The water is processed and discharged to a Publicly Owned Treatment Works (POTW) under pre-treatment limits. Hydrocarbons recovered from the wastewater are processed in the same manner as the other products.

Various portable processes could be used to pre-treat waste before shipping to an oil recycling facility. In addition, it is possible to ship water that meets pre-treatment standards to a POTW. The acceptability of the waste will depend on its source and characteristics, as well as the volume. Each municipality has different requirements.

Other Commercial Oil Recovery Methods:

Other oil recovery methods are being used elsewhere in the U.S. These technologies are not currently commercially available in Alaska, but they may be considered in the event of a spill. These methods include the following:

- Oil is heated to a temperature below its flash point and injected into sludge to dissolve the waxy and gelatinous deposits to facilitate their recovery.
- Gravity separation, chemicals, heat, lighter oils and solvents, and emulsion-breaking chemicals are used to thin heavier fractions.
- Coker units are used at refineries to dispose of certain types of sludge.
- Mixing different oil types to enable their processing may make variable angle mixers more efficient.
- A rotary vacuum filter, consisting of a horizontal drum with a filter media on its outer surface, is partially submerged and rotated in a tank containing sludge. A vacuum pulls liquid inward while retaining solids on the outside, which are then scraped off.
- A scroll-type centrifuge rotating at 75-100 rpm forces solids against an inner bowl and on to discharge. High-feed rate and durability make this a popular item at refineries. The effluent still requires treatment and the solids produced might not be pumpable. Neither heat nor chemicals may be necessary to optimize the performance of two-stage centrifuges. Generally, centrifuges are operated only for 1-3 weeks at a time of 40-60% rated capacity.
- Gravity-belt filters press sludge between two moving belts and force out oil and water. These filters rely on the application of costly high molecular-weight polymers to coagulate sludge. Changes in the

sludge, including pH and H₂S emissions, can result in problems. This method, however, has been used for many years on biosludges in Europe.

NON-OILY LIQUIDS:

Oil spill cleanup operations produce large amounts of liquid sewage wastes that originate from domestic sources such as toilets, laundry and shower facilities, cooking, and gathering centers. The volume of such wastes is directly proportional to the number of cleanup workers involved.

Domestic wastewater may be collected and transported to a municipal sewage treatment system for disposal after approval from the municipal government. If the volume of sewage generated by cleanup workers exceeds the additional load handling capacity of the municipal sewage treatment plant, on-site land-based or barge-mounted wastewater treatment plants can be used to treat surplus waste volumes.

If additional wastewater treatment facilities (either land-based or barge-mounted) are to be used, the volume and concentration must be estimated for proper sizing of treatment systems. The RP should consult with the EPA and the ADEC for guidelines and standards for accomplishing this.

The sewage collected from remote areas may originate from non-flushing portable toilets that produce a concentrated waste stream high in BOD, suspended solids, and deodorant chemicals. Domestic wastewater treatment alternatives to municipal treatment facilities include:

- Physical-chemical package plants
- Extended aeration package plants
- Rotating biological contactor package plants

Packaged domestic wastewater treatment plants are recommended because they are portable and can be mobilized quickly, if available. These treatment facilities require plan review, an ADEC wastewater permit, and an EPA NPDES permit. A vessel with a USCG- approved Type II Marine Sanitation Device (MSD) does not need an ADEC or EPA permit for discharges. (All vessels built after January 1980 are required to have a Type II or Type III MSD).

2. Short Term Management and Disposal Options for Solid Wastes:

If a spill occurs, oily and non-oily solid wastes will be collected, segregated, and stored at interim temporary storage areas and, if necessary, at the sites of cleanup operations on beaches. Most solid wastes will be stored in plastic bags after collection. Hazardous wastes will be handled in accordance with RCRA regulations and transported to the continental U.S. for disposal. Non-hazardous wastes will be handled in the most economic manner. Solid waste will be incinerated, if capacity allows; a secondary option is transport to landfills in Alaska or the continental U.S.

HAZARDOUS OILY SOLID WASTES:

RCRA hazardous solid wastes may be generated from oil spill response activities. Potential sources of RCRA hazardous wastes are:

- Spill-related materials that exhibit hazardous characteristics
- Maintenance wastes generated by vessels and vehicles used in response and clean up.
- Laboratory wastes and residues from testing and disposal of spill-related material.

A hazardous waste storage area will be established if hazardous wastes are generated. If necessary, satellite accumulation areas will also be established. Proper container storage and labeling practices will

be followed. Assigned personnel will monitor operations throughout the spill area to prevent improper waste disposal and to minimize the creation of hazardous waste through “mixing” (the disposal of small quantities of hazardous waste into solid waste containers, such as used oil tanks or boat washing slop tanks).

Hazardous waste management procedures include the following: ascertaining that response contractors are aware of regulatory requirements, including handling practices; obtaining generator I.D. numbers; proper labeling; storage; and monitoring of operational areas by personnel trained in hazardous waste management.

Hazardous wastes will be disposed of in a permitted hazardous waste facility in the continental U.S. since no permitted waste disposal site exists in Alaska at this time.

NON-HAZARDOUS OILY SOLID WASTES:

Incineration: Waste incineration can be an economical means of destroying organic compounds. Ash generated as a result of incineration will be tested for hazardous characteristics and properly transported for disposal at appropriately permitted facilities.

With approval from the North Slope Borough, up to 15 tons per day of non-hazardous oily solid waste, except sand and gravel, may be shipped to the North Slope Borough incinerator facility at Deadhorse.

Several other state-approved facilities for incineration of response waste exist in Alaska. Use of these facilities for incineration of response wastes requires written approval from ADEC. Consult with the local ADEC Office on the status of approved landfills and incineration facilities.

Disposal at Facilities in the Continental U.S.: Some solid waste is not suitable for incineration (e.g., rain suits and some kinds of boom). These wastes will be shipped to landfill disposal sites in the continental U.S.

Burial: On-site burial may be used at remote locations where oily debris will otherwise have to be transported large distances for centralized disposal. The operation will consist of excavating an on-site disposal pit and burying the oily waste. The advantages of this disposal method are reduced costs for transporting, packaging, storage, and ultimate disposal fees.

Disadvantages of this method include the logistics of transporting excavation equipment and personnel to remote sites and possible future leakage from the uncontained disposal pits.

On-site burial of oily waste requires a solid waste disposal permit from ADEC. Although on-site burial may be permitted in remote locations, the likelihood of it occurring without engineering controls is minimal. On-site burial is not a preferred waste management option because of the technical difficulties involved and public and agency concerns over such disposal.

Waste Sludge Disposal: The sludge resulting from certain treatment facilities will require further treatment or disposal. Sludge treatment may include:

- Fluidized bed incineration
- Steam stripping
- Digestion, dewatering, vacuum filtration, centrifugation
- Controlled land disposal

The quantity of sludge generated by the treatment process will depend on the solid content of the oily wastewaters treated. Steam-stripping can recover oil adhering to the solids and the process can produce a sludge possibly suitable for disposal at a permitted facility.

Depending on the organic content of the sludge, aerobic or anaerobic sludge digestion may be feasible. Heating the contents of the sludge digester will accelerate the rate of biological decomposition of the sludge and reduce the residence time required for sludge stabilization. The water resulting from the sludge dewatering operation may be returned to the wastewater treatment system ahead of the biological oxidation process. The stabilized sludge may be suitable for land disposal at a permitted landfill site.

Non-Hazardous, Non-Oily Solid Wastes: Non-oily solid wastes (refuse) are generated from a variety of sources during oil spill cleanup operations. Care must be taken to separate non-oily solids wastes from oily wastes and to maintain separation until ultimate disposal.

Separate trucks for onshore operations should be maintained for the transportation of non-oily solid wastes. The non-oily waste material may be sent to an appropriate municipal landfill or municipal incinerator with capacity to handle the wastes for disposal, if approved by local officials. Since most towns and cities have municipal landfills, disposal will likely occur at local population centers. The RP should coordinate with municipal officials.

The refuse produced by a large-scale oil spill cleanup operation may have a significant impact on the local landfill. For example, the Exxon Valdez oil spill cleanup operations in Prince William Sound increased local refuse disposal as much as 500%, with a corresponding increase in personnel and equipment at the local landfill operations to meet the higher demand. In such situations, it is important to coordinate with the community to assure that personnel and equipment requirements are met.

Disposal of wastes in solid waste sites must conform to the facilities' permit requirements.

3. Long-Term Management and Disposal Options:

Open Burning: On-site burning is a potential disposal method for non-hazardous oil-stained rock and sand mixtures, tar balls, logs, driftwood, and miscellaneous solid wastes.

Remote Stockpile Burning: Open burning may be a feasible method for large quantities of combustible oily wastes that are stockpiled in remote areas, but this method generally requires weather suited for smoke dispersal. Burn residue produced from open burning needs to be collected, tested for hazardous characteristics, and properly transported to disposal sites. Open burn pits designed to facilitate efficient removal of residues can facilitate a smoother cleanup operation.

Open burning in Alaska is regulated by ADEC, and before proceeding with an open burning operation, written approval must be obtained from ADEC. Approval is contingent upon submission of an open burning plan that addresses concerns outlined in the Alaska Air Quality Control Regulations (18 AAC 50). These concerns include the following: air contaminants, location of sensitive population centers, weather considerations, visibility impacts, overall coordination, public information, and other project specifications. In addition, the plan for open burning must include an evaluation of feasible alternatives with a demonstration that open burning is the most feasible choice.

In Situ Open Burning: Combustible materials, such as oiled logs, branches, and other natural materials found along beaches, can be burned in piles where they have been collected. A propane torch can be used to initiate combustion or a burn promoter, such as fuels, can be added to the oiled materials.

Open burning can also be applied to any oily wastewater collected for off-site disposal. However, this disposal method would require a site-specific ADEC Open Burning Permit and an ADEC Wastewater Disposal Permit. Burn residue will have to be contained and collected at each site and tested for hazardous characteristics, thus leading to possible logistical problems.

Sustained burns of logs and other large items can penetrate some substrates to a depth of about one foot, thus removing the underlying oil. Oil that has migrated downward into beach materials beyond that depth likely would not be burned.

Other disadvantages or constraints to *in situ* open burning can include:

- Public concerns.
- Threat of spreading (e.g., grass or forest fire)
- Burn residue might be hazardous or otherwise present a pollution problem
- Direct biological impacts from heat may be a concern where an extensive area is fired.
- Smoke plume may not meet regulatory requirements.

Incineration: Incineration can be used to dispose of oily waste materials at the source or at temporary collection and storage areas. The incineration process must be combined with appropriate flue gas cleaning and residue handling in order to complete the overall waste management process. A variety of wet, semi-dry, and dry acid-gas scrubbing processes are available with extensive, successful experience in application to incineration systems. The applicability of a specific process is determined through evaluation of flue gas characteristics, reagent and residue handling costs, need for plume suppression, and other factors. Sensitive instrumentation for detecting pollutant levels within the system is also vital, as is the ability of the equipment to adjust to changing conditions. Two technologies currently dominate the waste incineration industry: rotary kiln incineration and fluidized bed incineration. The advantages and disadvantages of both systems are well known and documented since both technologies are established incineration techniques with several commercial plants currently in existence.

Rotary kiln incineration appears to be the better overall option for necessary permanent incineration capacity. If on-going operations justify use of a permanent incineration system, the following system appears preferable:

- One or more medium-sized, modularized rotary kiln systems on the same site with good access by water and land.
- Necessary feed storage, feed preparation, ash-handling facilities, and other support services as needed for all units, making these common to all incineration units to the extent possible and practical.
- Operation of one unit at a time on locally generated wastes at reduced capacity to maintain the facilities in ready condition and to maintain the skills of the operating crew.
- Delivery of spill wastes and containerized materials to the site by barge for processing. Storage of the wastes most amenable to storage will stretch the processing period and reduce the size, number, and cost of the facilities.

This rotary kiln incineration system can be developed and implemented in a reasonably short time and in compliance with regulatory requirements. Some oil spill cleanup specialists have indicated that there are portable incinerators on the market that provide good backup in an emergency because they can be quickly dispatched to remote sites.

Bioremediation:

- a. ***In Situ* Biodegradation:** Bioremediation involves adding nutrients (nitrogen and phosphorus) to enhance indigenous microbial activity. Successful bioremediation can accelerate the cleanup of a spill and reduce the amount of oily wastes requiring disposal.

Bioremediation of *in situ* spilled oil is still in the research phase, but holds promise for use under favorable conditions on oiled sand, pebbles, cobble, driftwood, and other natural beach materials. The shoreline configuration must be amenable to this method, but smaller debris does not have to be transported to a remote site for ultimate disposal. Larger items of debris must be dealt with separately and the technique might require several seasons for significant degradation to occur.

- b. **Landfarming:** Some oil spill specialists in other parts of the country consider landfarming a feasible alternative to oily waste disposal. In Alaska, however, due to the low temperatures, short summers, high precipitation, and the scarcity of flat soily areas, further research must be done before the plausibility of this method can be determined. In landfarming, oily sludges are spread on a selected site and then combined with soil, moisture, and nutrients in the presence of oxygen to promote bacterial degradation of the hydrocarbon components. This requires an even application of flowing oily wastes. Smaller items, such as sand, pebbles, short seaweed (less than 6 inches long), sludges, and contaminated soils can also be processed this way. The most suitable sites are large fields with deep, tillable soil and a constant supply of water. Some sites might require the placement of a liner. The soil is prepared, the nutrients and wastes are applied, and then the field is tilled periodically. The soil pH must be controlled and the field must not have a greater than 1% or 2% grade. Necessary equipment includes backhoes, tractors, rototillers, disc harrow or plows, fencing, pumps, and sprinkler systems. This method requires a permit and monitoring. If a liner is used, it must be removed when the hydrocarbons reach approved levels.

Landfilling: Approximately five permitted landfills that can accept oily wastes are currently in use in Alaska. These landfills are associated with oil fields on the North Slope and are typically reserved exclusively for the company operating the landfill.

At this time, no landfill facility in Alaska will accept significant amounts of oily solid wastes. In the event of a large spill, landfill disposal will be feasible only if ADEC permits disposal of significant amounts of oily waste at existing sites and/or expedites permitting of proposed sites. The advantages of having an in-state oily waste landfill include immediate availability and accessibility, as well as reduced logistical requirements for transportation, packaging and disposal.

WASTE DISPOSAL OPTIONS			
WASTE STREAM	PRIMARY OPTION	FIRST ALTERNATIVE	SECOND ALTERNATIVE
Fresh Oil (101)	Refining	Fuel Blending	In Situ Burning
Weathered Oil (102)	Fuel Blending	Land Treatment	Solidify & Landfill
Emulsions (103)	Fuel Blending	Land Treatment	Solidify & Landfill
Hydraulic Fluids (104)	Refining		
Oil Debris (105)	Incineration	Open Burning	Landfill
Oily PPE (106)	Incineration	Landfill	
Oily Sand/Gravel (107)	In-Situ Burning	Land Treatment	Landfill
Oily Sorbents (108)	Fuel Blending	Incineration	Landfill
Oily Wastewater (109)	Electrocoagulation Treatment		
Animal Carcasses (110)	Offer for Research	Incineration	
Domestic Wastes (201)	Incineration	Landfill	
Non-Oily Debris (202)	Incineration	Landfill	
Pallets (203)	Recycle/Reuse	Open Burn	Landfill
Paperboard (204)	Recycle/Reuse	Open Burn	Landfill
Drums (206)	Recycle/Reuse	Landfill	
Hazardous Waters (301)	Special Handling, Storage, Treatment		

WASTE DISPOSAL CONTRACTORS		
Listed are some contractors who can provide disposal or waste management services. These are not the only available contractors, but represent the variety of services available.		
Facility Name	Contact Information	Comments
Recovered Products (gas, diesel, etc.)		
Alaska Pollution Control	907-344-5036 10620 Old Seward Highway Anchorage, AK 96515	Processes oily water, motor oils and recovered fuels
Alaska Soil Recycling	907-349-3333 1040 O'Malley Road Anchorage, AK 96515	Soil burning facility
Basin Oil Company	800-439-2948 8661 Dallas Ave A	Non-Haz used oils blended for ship bunkers

	Seattle, WA 98108	
Petroleum Reclaiming Services	206-587-6206 3003 Taylor Way Tacoma, WA 98421	Waste oil processor, also takes oily water
Philip Environmental	800-228-7872 1011 Western Ave, Ste 700 Seattle, WA 98104	Full service haz-waste disposal contractor
Chemical Waste Management	800-962-4987 17629 Cedar Springs Arlington, OR 97812	Full service has contractor. Landfills located in Oregon and California.
Clean Soils	907-258-7645 2301 Spar Avenue Anchorage, AK 99501	Soil burning facilities in Anchorage and Kenai. Mobile facility also available
Foss Environmental	206-281-3823 7440 W Marginal Way S Seattle, WA 98108	Full service contractor.
Contaminated Soil		
Philip Environmental	800-228-7872 1011 Western Ave, Ste 700 Seattle, WA 98104	Full service haz-waste disposal contractor
Chemical Waste Management	800-962-4987 17629 Cedar Springs Arlington, OR 97812	Full service has contractor. Landfills located in Oregon and California.
Oily Contaminated Equipment/Materials & PPE		
DOH Environmental	800-478-1917 10012 Jensine Juneau, AK 99803	Spill cleanup contractor. Can manage waste through appropriate contractors.
Channel Sanitation Services	907-780-4288 5600 Tonsgard Court Juneau, AK 99801	Non-hazardous disposal only
Chemical Waste Management	800-962-4987 17629 Cedar Springs Arlington, OR 97812	Approved landfills.
Decontamination Solutions		
Philip Environmental	800-228-7872 1011 Western Ave, Ste 700 Seattle, WA 98104	Full service haz-waste disposal contractor
Chemical Waste Management	800-962-4987 17629 Cedar Springs Arlington, OR 97812	Approved landfills.
Oily Sorbents		
Channel Sanitation Services	907-780-4288 5600 Tonsgard Court Juneau, AK 99801	Incineration of non-hazardous oily materials.
Basin Oil Company	800-439-2948 8661 Dallas Ave A Seattle, WA 98108	Delivers non-hazardous sorbents to facility for energy recovery.

Spent Chemicals		
Philip Environmental	800-228-7872 1011 Western Ave, Ste 700 Seattle, WA 98104	Full service.
Chemical Waste Management	800-962-4987 17629 Cedar Springs Arlington, OR 97812	Full service.

3240.3 – Decanting Policy

With State approval, on-site decanting may be allowed. The form for gaining SOSC approval for decanting is linked on ADEC’s website under Waste Management permits:

<http://dec.alaska.gov/spar/ppr/response-resources/permits-tool/#nogo>

3240.4 – Sample Waste Management Plan

Standing [waste management permits](#) may be found in the “Planning” section of this document. The [ADEC’s STAR Manual](#) provides a checklist for waste management.

3250 – Decontamination

The Alaska Department of Environmental Conservation (ADEC) [Spill Tactics for Alaska Responders \(STAR\) Manual](#) provides guidance for vessel decontamination and other tactics related to spill response.

3260 – Alternative Response Technologies

For Alternative Response Technology guidance on Dispersants and In-situ Burning, reference the Alaska Regional Contingency Plan. Additional technical assistance can be found in the [ADEC’s STAR Manual](#).

3300 – EMERGENCY RESPONSE

3310 – Search and Rescue (SAR) - TBD

3310.1 – SAR Area Resources -TBD

3320 – Salvage/Source Control

Reference [Section 8300](#) of this document.

3330 – Marine Fire Fighting

Reference Section [8100 – Marine Fire Fighting](#) for guidance. Additionally, reference the section, [9730 - Geographic Zone Contingency Plans](#), for supplemental details specific to each geographical zone.

3340 – Hazardous Substances

Reference Section [7000 – Hazardous/Radiological Substances](#) for guidance on hazmat responses.

Unalaska - Oonalaska Clinic	581-2742

3350.2 – Bristol Bay

In the Bristol Bay Geographic Zone, only the City of Dillingham has hospital facilities. The Bristol Bay Area Health Corporation operates the hospital and clinics. Two sub-regional clinics, located in Chignik and Togiak, employ mid-level practitioners to provide more extensive patient care. Most of the smaller towns

and villages offer medical care through a small clinic with most care provided by health aides. Clinic hours are 0900-1500, Monday through Friday.

Kanakanak Hospital

Location: 6000 Kanakanak Road (Box 130), Dillingham, AK 99576

Phone: 842-5201/ 800-478-5201

Number of Beds: 16

24 hr. Emergency Services: Yes

3350.6 – Northwest Arctic

In the Northwest Arctic Geographic Zone, only Kotzebue and Nome have hospital facilities. Most of the smaller towns and villages offer medical care through a clinic.

Hospitals within the Northwest Arctic Geographic Zone			
Facility	Location	Capacity	Phone
Maniilaq Health Center 436 5 th Avenue, Kotzebue, AK 99752	Kotzebue	17-bed acute care unit; including inpatient and emergency treatment	442-3321, Emergency Dept 442-7209
Norton Sound Regional Hospital 1000 Greg Kruschek Avenue, Nome, AK 99762	Nome	18-bed acute care hospital; including inpatient and emergency treatment	443-3311, EMS 443-3306

3350.7 – Western Alaska

In the Western Alaska Geographic Zone, only Bethel has hospital facilities. Most of the smaller towns and villages offer medical care through a clinic.

HOSPITALS WITHIN THE WESTERN ALASKA GEOGRAPHIC ZONE			
Facility	Location	Capacity	Phone Number

Yukon-Kuskokwim Delta Regional Hospital	Bethel	50 Bed	543-6300
The hospital is a qualified Acute Care facility. Critical patients will be transported to Anchorage hospitals.			
SUB-REGIONAL CLINICS WITHIN THE WESTERN ALASKA GEOGRAPHIC ZONE			
Location		Phone Number	
Aniak		675-4556	
Emmonak		949-3500	
St. Mary's		438-3500	
Toksook Bay		427-3500	
Hooper Bay		758-3500	

Sub-regional clinics provide preventative and urgent care (including cardiac monitor, defibrillator, IV equipment, oxygen, casting equipment and other advanced life support equipment), diagnostic review, physical exams, prenatal care, minor surgery, laboratory tests, X-rays, and medications.

3360 – Law Enforcement

Reference [Community Profiles](#) for town and village law enforcement information.

3370 – Oil Spill

This list assists the IC, either government or RP, and staff in completing the initial response actions associated with a medium to large-sized oil spill. This list is not exhaustive and should be used at the discretion of the IC and the UC.

☐ **Define Nature of Incident**

- a. Determine facts of spill.
 - Responsible Party (name and phone #)
 - Location and time of incident
 - Type of incident (explosion, grounding, operational, etc.)
 - Type of product
 - Movement of spilled product
 - Environmental resources, sensitive areas, and historic properties at risk
- b. Determine whether RP is willing/able to respond.
- c. Classify size of spill.
- d. Notify natural resource trustees
- e. The FOSC (or authorized representative) needs to perform the following:
 - Consult with natural resource trustees on potential resources at risk, including (but not limited to) wildlife on rat-free islands;
 - Conduct Endangered Species Act consultation (contact DOI and DOC to determine the presence of, and potential impacts to, threatened and endangered species and their critical habitat); and
 - Determine whether incident is categorically excluded under the Programmatic Agreement to protect historic properties and, if not, activate an FOSC Historic Properties Specialist.

☐ **Evaluate Hazards to Human Health/Safety**

- a. Determine threat to public health.
- b. Assess fire/explosion hazard.

- c. Assess personnel safety based on potential/existing hazards.
 - d. Determine appropriate level of personnel protective equipment for responders.
- ❑ Evaluate Severity of Incident and the Need for Additional Resources
 - a. Estimate amount of spilled product and total potential amount.
 - b. Estimate duration of spill response efforts.
 - c. Assess weather/sea conditions.
 - d. Determine the presence (or suspected presence) of invasive species (e.g., rats).
- ❑ Initiate Response Strategy
 - a. Protect responders and the public.
 - b. Secure or isolate the source of spill.
 - c. Protect sensitive areas:
 - Consult with natural resource trustees on the protection of sensitive areas (including rat-free islands) and resources and on potential response options to be taken;
 - Develop priorities consistent with environmental sensitivity and protection priorities identified in Sensitive Areas Section of this plan.
 - d. Initiate containment and recovery of spilled product.
 - e. Initiate spill tracking.
 - f. If ballast water discharge is considered as an option for vessel stability or other concerns, the threat of invasive species needs to be addressed by responders.
- ❑ Inform Local Residents, Communities, & Stakeholders
 - a. Prepare Press Statement.
 - Report the extent that USCG, EPA, ADEC, RP and local emergency response personnel are responding to discharge event.
 - Give brief details of the discharge.
 - Describe actions taken by the UC.
 - Announce that formal press release will be issued as more information is received.
 - b. Contact Local Media. (Local radio, newspaper and television contact information available in the Media Contacts, [Section 2330](#) of this document)
 - c. Be forthcoming, and provide as much information as quickly as possible. If no information is available, say so but ensure that information is provided to the media as soon as it is available.
 - d. Conduct appropriate briefings via the ICS Liaison Officer.

RAMP UP PROCEDURES

A spill response progresses through a series of steps where the number of personnel and amount of equipment is increased (or decreased) as necessary to meet the demands of the situation. This increase of resources to address response needs is called a “ramp up.” USCG will rely on its Incident Management Handbook and State of Alaska personnel will employ the Alaska Incident Management System (AIMS) Guide and well as the Spill Tactics for Alaska Responders (STAR) to direct their staffing of emergency response teams.

The ramp up begins when the spill is first reported and progresses with the sequential and prioritized activation of the response resources of the RP and the local, state and federal responders. Each spill response will differ according to spill size and severity, location, season, and a variety of other factors. Personnel needs will vary accordingly.

The ramp up procedures and personnel requirements presented below are provided as guidance for the UC during the initial staffing of the ICS. The ICS can expand and contract to meet the needs of an emergency response without any loss of effectiveness or control. The goal for any major spill is to have the personnel in place to staff a complete ICS within the first 96 hours of a response. In addition to federal and state responders, various have significant numbers of trained personnel available to help staff an ICS. Contact the local emergency management organizations listed in Part One of this section to recruit local, trained personnel to assist in the response effort.

The ramp up to a full oil spill response generally moves through three staffing levels. The Initial Response Team (Hours 0-6) will consist primarily of first responders who will carry out initial response actions. The Transitional Response Team (Hours 6-96) will form as additional personnel arrive on-scene and ICS functions are added. The Full Response Team (by Hour 96) will be complete when full ICS staffing levels have been reached. Qualified personnel within the ICS will identify resources and equipment necessary for an effective response.

This ramp up guidance outlines the response of federal and State personnel. RP personnel will initiate a concurrent ramp up according to the procedures referenced in their contingency plan. In those incidents where there is imminent threat to life and property, the appropriate local Fire Chief, State Trooper, or Emergency Manager will be the IC. The LOSC will follow the guidance of their local emergency response plan.

Hour 0-6: Initial Response Team

The Initial Response Team will consist primarily of the FOSC and SOSC response officers, natural resource trustees (if available), and local emergency response and RP personnel. The Initial Response Team will carry out initial response efforts, which include notification and equipment mobilization. Depending on the size of the spill, a UC may begin to form as the Initial Response Team carries out these response actions.

Notifications: The RP is ultimately responsible for making notifications to local, state and federal agencies. Notifications will include local officials, police, and fire departments. USCG or EPA will notify the appropriate federal agencies and other points of contact, as necessary. The FOSC will notify appropriate natural resource trustees to begin the consultation process on resources at risk (including threatened and endangered species and their critical habitats), response actions that may affect trust resources, and response actions to protect or reduce the injury of trust resources, including (but not limited to) actions to ensure as appropriate (1) incident related vessels/aircraft are rat-free, and (2) a rat response plan is implemented for the stricken vessel. ADEC will notify the appropriate State agencies.

Initial Response Action: Following these notifications, the initial responders will assess the chemical characteristics of the spilled material and establish a safe level of Personnel Protective Equipment (PPE) prior to dispatching a response team to the scene. Upon arrival, the response team will conduct a site characterization to evaluate environmental hazards. Upon ensuring a safe operating environment, they will attempt to determine the source of the spill, identify the RP, secure the source of discharge, and begin to gather data for the ICS to use to formulate a response strategy or validate the RP's strategies. This initial response team will normally have no containment or product removal means with them at this time, unless provided by the RP. If local authorities or federal/state responders identify an immediate threat to public health and safety, appropriate action shall be initiated. If the situation warrants, an evacuation may be implemented according to the procedures referenced in the local emergency response plan.

The response team will contact the FOSC and/or SOSC, report the details of the spill, and initiate a preliminary investigation into the cause of the spill. The FOSC/SOSC or other response team personnel will advise the RP regarding the legal requirement to initiate containment and recovery actions. The FOSC will be advised of the severity of the spill and will activate the ICS. The FOSC and/or SOSC will brief the federal, state and local government agencies regarding the spill status and ramp up procedures. The FOSC will continue to consult with natural resource trustees on actions to be taken that may affect trust resources. The FOSC will activate an FOSC Historic Properties Specialist unless the FOSC determines that the incident is categorically excluded from the National Programmatic Agreement to protect historic properties.

ADEC will select any available State resource agency personnel to serve as a local contact until ADEC responders arrive on-scene. ADEC will request that ADNR and ADFG identify environmental priorities for protection. ADNR and ADFG will use the environmental sensitivities information in this plan as a primary source for this information. NOAA may also be contacted for initial environmental sensitivity and wildlife concentration information. ADEC will forward these priorities to the IC and the UC.

The RP is responsible for deploying appropriate privately owned pollution response equipment as quickly as possible, regardless of whether federal/state equipment has been deployed in the interim. The FOSC/SOSC may assist the RP and arrange for initial delivery of pollution response gear via the most expedient mode of transportation.

Command Center Establishment: A field command post will be assembled to coordinate efforts until the FOSC, SOSC, LOSC and RP can establish the command center. The location of this field command post will depend upon the location and severity of spill, time of year, weather, and other considerations.

State, federal, and local personnel arriving on-scene should realize that workspace, telephone lines, and other office resources might be quite limited during the initial response. Individuals are encouraged to bring cellular phones to communicate with their respective home offices (realizing that cellular phone capabilities also may be severely limited or non-existent at the incident location).

Staging Areas: In community profiles, potential staging areas may be identified for a specific community.

Hour 6-96: Transitional Response Team

The Transitional Response Team forms as additional federal, state and local response personnel arrive on-scene. After the initial response, the scope and size of the spill can be gauged, and the UC will convene and ICS staffing will increase. In a government-led spill response, the UC will designate an IC. In a RP-led response, the IC will be a representative of the RP. The IC will designate appropriately trained personnel as Section Chiefs for the Operations, Planning, Logistics, and Finance/Administration Sections of the ICS. As the response develops, appropriate ICS functions will be added until a full response team is in place.

Hour 96: Full Response Team

A full ICS response team should be assembled by Hour 96 of the spill response. Staffing-depths and positions-filled will vary with the response, as will the order in which these positions are filled. The Full Response Team will follow the command structure referenced in the Alaska Incident Management System (AIMS) Guide and/or the USCG Incident Management Handbook. Response personnel may include federal, state and local agency personnel, employees of the RP, and independent contractors, or other organizations' personnel, as appropriate.

ADDITIONAL RESPONSE POLICIES:

Health and Safety: For most spills, a Safety Officer will be designated by the IC. The Safety Officer will be responsible for ensuring that the spill site is properly characterized, the hazards identified, and personnel properly equipped and adequately briefed prior to allowing entry into the spill area. The Safety Officer will also be responsible for ensuring site security and establishing emergency procedures for decontamination and evacuation in the event of injury or change in conditions. The Safety Officer answers directly to the IC and will have the authority to suspend any operation deemed unsafe or in violation of safety regulations.

Once the emergency response is under way, the Safety Officer will develop a Site Specific Health and Safety Plan that will address all the required elements in OSHA's Hazardous Waste Operations and Emergency Response Regulations (29 CFR 1910.120), including but not limited to:

- Organizational Structure
- Training Requirements
- Risk and hazard analysis for each planned cleanup activity
- Personnel Protective Equipment (PPE)
- Site Security and Control
- Air Monitoring, Medical Surveillance
- Decontamination
- Emergency Response Plan
- Emergency Communications
- Sanitation and Lighting

In Situ Burning, Dispersants and Other Chemical Countermeasures: Decisions regarding the use of in situ burning and/or dispersants or any other chemical response tactic will be made according to the guidelines presented in the Regional Contingency Plan, as referenced in [Section 3260](#) of this document.

Waste Removal and Disposal: The ICS Planning Section Chief will be responsible for developing a waste removal and disposal plan that provides the necessary logistical and procedural information to ensure a fast and efficient transfer of wastes to disposal facilities. The disposal plan must comply with existing laws and regulations.

Oversight of the waste disposal plan will normally be the responsibility of the State of Alaska. Alaska law (18 AAC 75.319 & 18 AAC 75.327) requires that cleanup and waste disposal plans for hazardous substances, including oil, be approved by ADEC. For information and guidelines on procedures for transporting, storage, and disposal of wastes and a listing of disposal related permits, reference [Section 3240](#) and [Section 4800](#).

Cost Recovery/Documentation: Reference [Section 6000](#) of this document.

Public Affairs: The IC/UC will direct all media inquiries to the Public Information Officer(s). The Public Information Officer position may be filled jointly by regulatory agency and RP representatives. A Joint Information Center (JIC) may be established. Consult [Section 2300](#) for additional guidance.

3370.1 – Disaster/Emergency Declarations

A natural disaster may cause an oil or hazardous substance discharge. When a State disaster emergency declaration and/or a federal major disaster or emergency declaration has been issued, additional

procedures are necessary to coordinate the spill response effort with the overall disaster/emergency response effort. These procedures are also used in cases where the spill itself is determined to be a disaster under State law and/or results in a federal emergency declaration.

State operations are affected when the governor finds that a disaster has occurred or that a disaster is imminent or threatened and, by proclamation, declares a condition of disaster emergency. In such cases, the State's spill response organization will fall under the State Emergency Coordination Center, Operations Section. The Incident Commander of the disaster response is the State Area Commander appointed by the Governor. As such, the State Area Commander would set priorities to make the best use of available resources. Within these constraints, the SOSC would command the spill component of the disaster response to effect containment and cleanup.

The State of Alaska Memorandum of Agreement (MOA) between the Department of Environmental Conservation, Division of Spill Prevention and Response (DEC/SPAR) and the Department of Military and Veteran's Affairs, Division of Homeland Security and Emergency Management (DMVA/DHSEM), effective January 8, 1992, explains how a spill response will be managed by the State during a declared disaster. Under the MOA, the Commissioners of the DEC and the DMVA will coordinate to determine that a release constitutes a disaster emergency under AS 26.23 and may request the Governor to declare a disaster emergency. (Reference the Alaska Regional Contingency Plan).

The National Response Framework (NRF) establishes the basis for the provision of federal assistance to a State and its affected local governments impacted by a catastrophic or significant disaster or emergency that results in a requirement for federal assistance. The NRF is based on the fundamental assumption that a significant disaster or emergency will overwhelm the capability of State and local governments to carry out the emergency operations necessary to save lives and protect property. Consequently, resources of federal departments and agencies are used to provide federal response assistance to the State. The NRF uses a functional approach to group the types of federal assistance that a State is most likely to need into fifteen Emergency Support Functions. Responses to oil spills or hazardous substance releases resulting from natural disasters are provided through Emergency Support Function (ESF) #10, Oil and Hazardous Materials Response.

Under the NRF, the President appoints a Principal Federal Official as the President's representative to coordinate the overall delivery of federal assistance. Federal departments and agencies will provide response assistance directly to the State, under the overall direction of the Principal Federal Official and based on priorities identified by the State Coordinating Officer (SCO).

A figure below shows the location of ESF #10 within the entire State/Federal response structure. The organizational framework for responding to oil spills and hazardous substance releases within ESF #10 stays the same for spills or releases that occur in the absence of a natural disaster. However, during a State-declared disaster emergency, OSCs report to the SCO. During a federal major disaster or emergency declaration, the SOSC ultimately reports to the SCO, and the FOSC ultimately reports to the Principal Federal Official. When either a State or federal disaster results in conflicting demands for scarce resources (e.g., aircraft) the SCO is responsible for making resource allocation decisions.

In some cases when a federal major disaster or emergency declaration has been issued, response costs incurred by local and State agencies may be eligible for reimbursement under Public Law 93-288. In such cases, agencies must meet additional accounting requirements established by the Federal Emergency Management Agency (FEMA). The SCO will provide guidance on these requirements.

Generally, the Governor's proclamation of a disaster emergency is a prerequisite to a federal major disaster or emergency declaration. However, the President may determine that an emergency exists for which the primary responsibility for response rests with the United States.

Figure 3-1: Spills Resulting from Natural Disasters that Do Not Have a Presidential Declaration

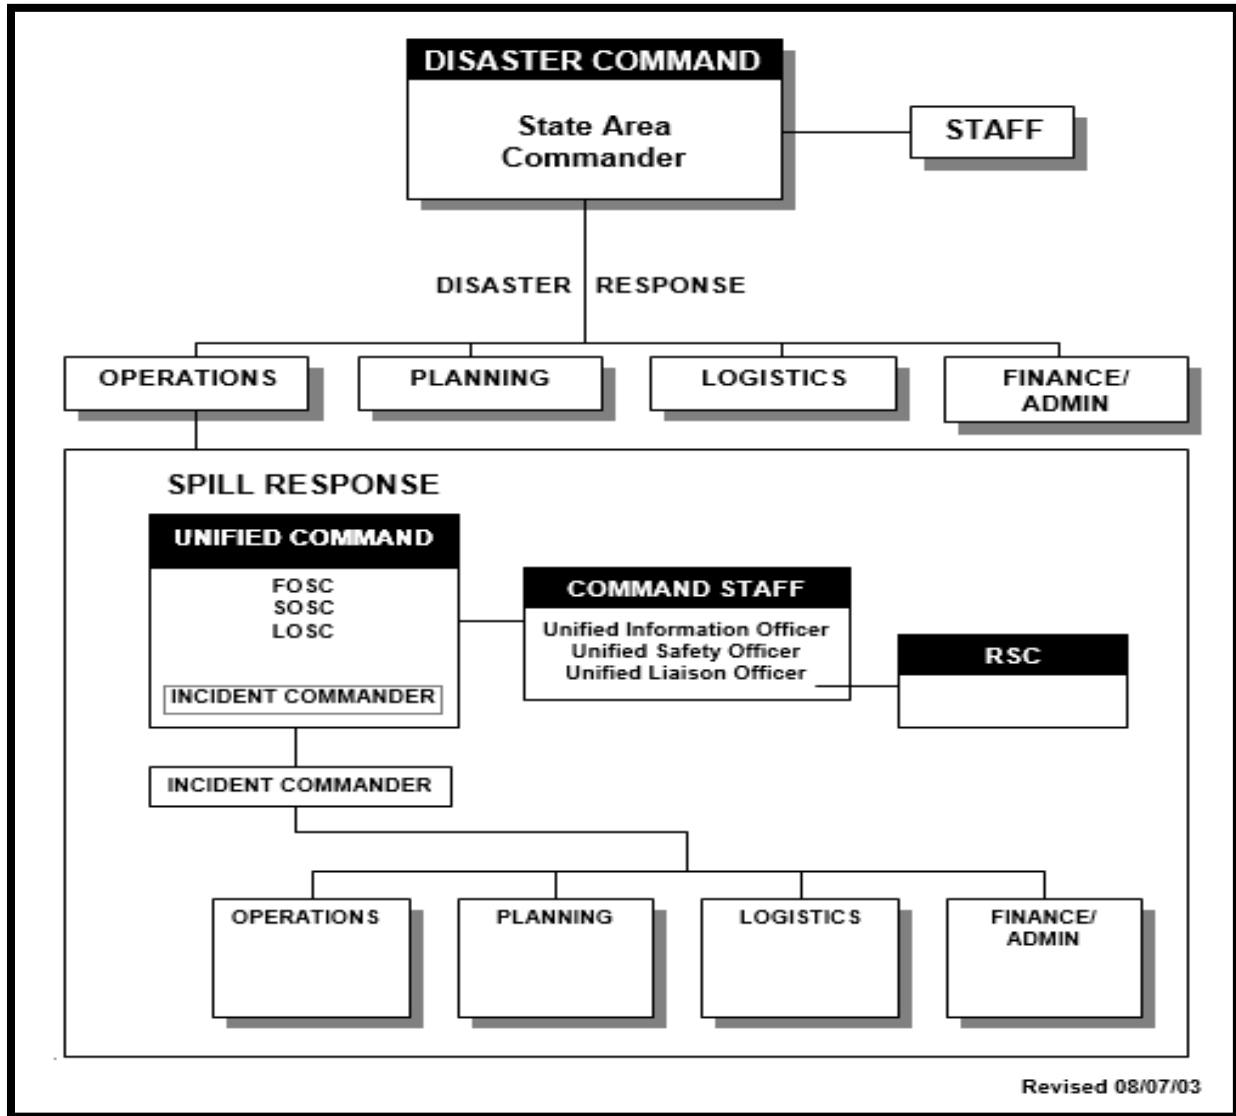

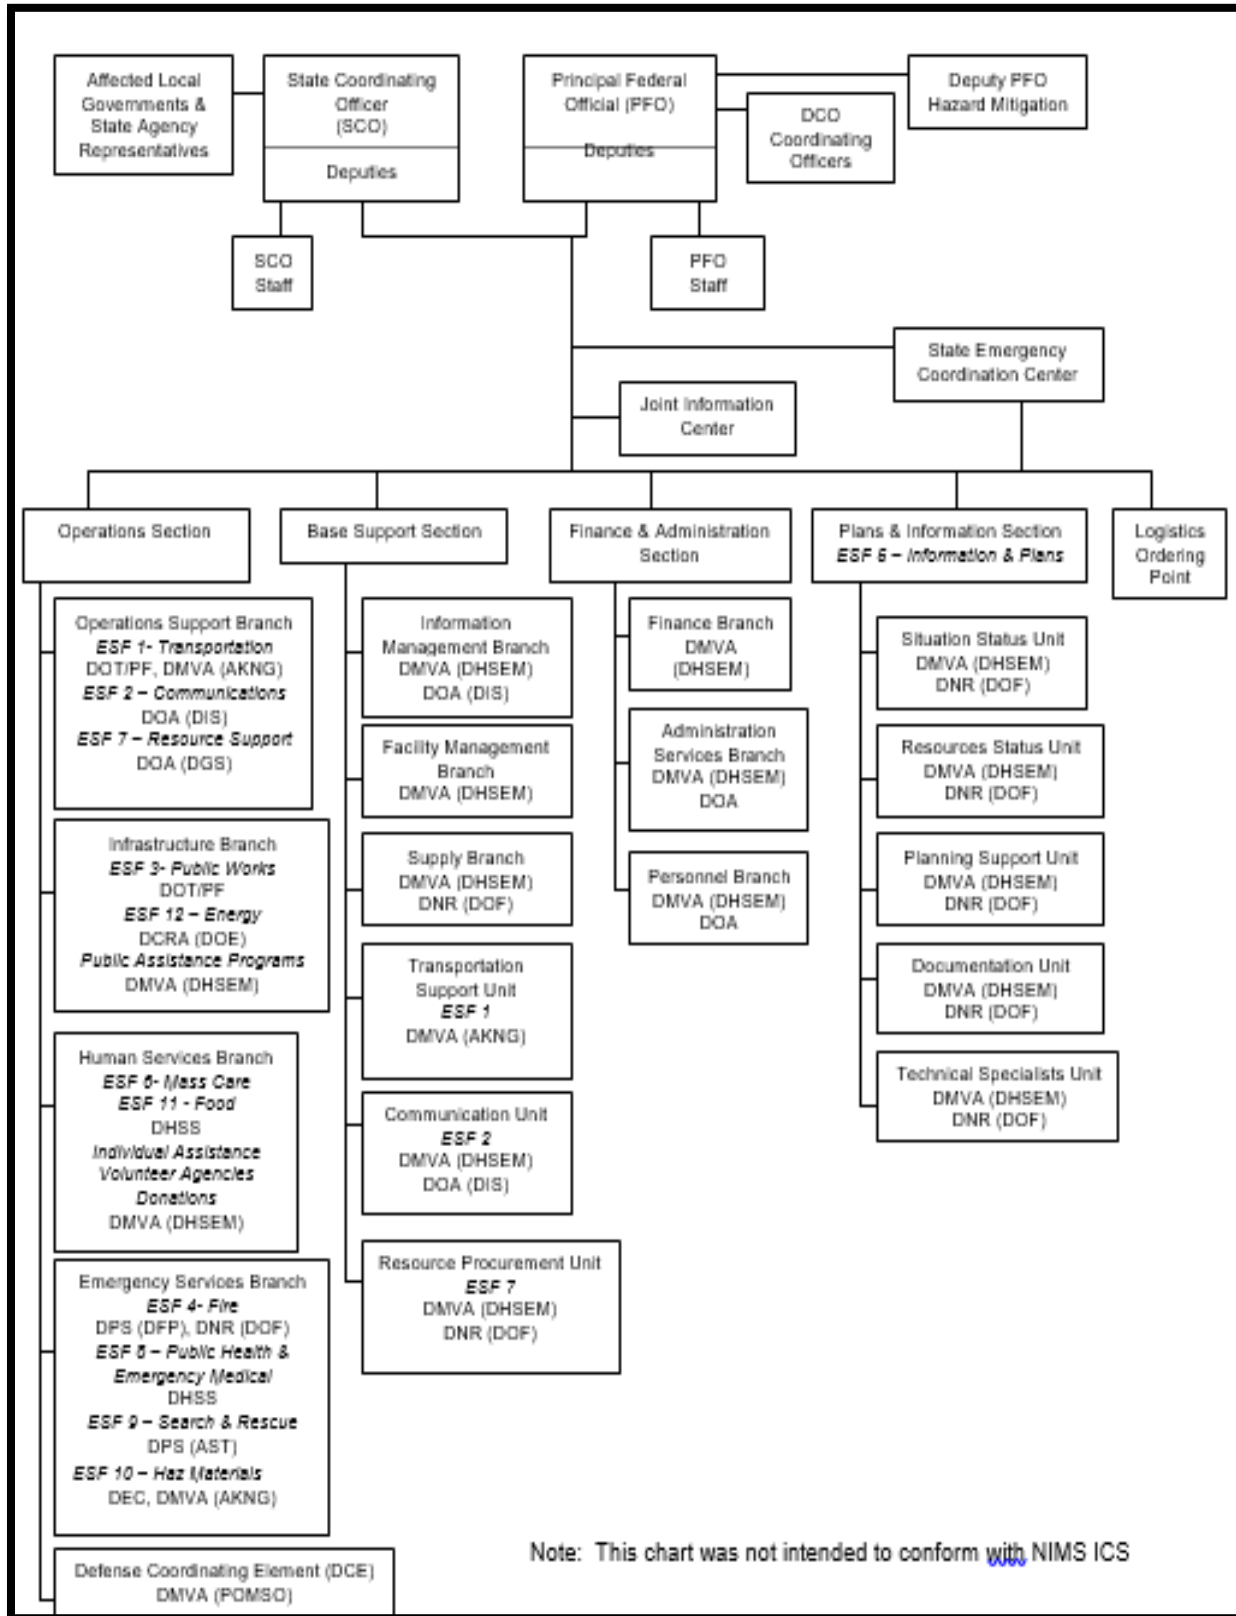

Figure 3-2: Spills Resulting From Natural Disasters that Have a Presidential Disaster Declaration

3400 – AIR OPERATIONS

3410 – Air Tactical

3410.1 – Aerial Surveillance - TBD

3410.2 – Aerial Dispersant Application

Reference the Alaska Regional Contingency Plan for the Oil Dispersant Guidelines for Alaska. Additional technical assistance for dispersant application can be found in the [ADEC's STAR Manual](#).

3410.3 – Procedures for Temporary Flight Restrictions

FAA can be requested to impose flight restrictions, and FAA controllers can be deployed and operate from a USCG WHEC or WMEC.

3410.4 – Permanent Area Restrictions

FAA can be requested to impose flight restrictions, and FAA controllers can be deployed and operate from a USCG WHEC or WMEC.

3420 – Air Support

Consult with the Alaska Supplement to the NOAA Flight Information Publication, or the FAA on airport and runway specifics. In general, runways are paved in locations serviced by the major commercial airlines including Alaska, United, and Delta. Commuter airlines service the smaller communities, and charter flights aboard light aircraft and helicopters are available. During summer months when tourist traffic is heavy, charter flights may be limited. Weather may close the airports for days at a time. High winds and low visibility often ground small planes. Airplane crashes are common. For a major response, local air traffic will dramatically increase. FAA can be requested to impose flight restrictions, and FAA controllers can be deployed and operate from a USCG WHEC or WMEC.

Websites Providing Aviation/Airport Information:

- [Airline Data Inc.](#)
- [AirNav.com](#) Offers information and useful details on various airport aspects and services availability.
- [AirportIQ 5010: Airport Master Records and Reports](#): This *GCR & Associates, Inc.* website provides unedited information with data derived from the National Flight Data Center FAA Airport Master Record (Form 5010).
- [The Alaska DOT, Division of Statewide Aviation](#) provides rural airport information, including a link to diagrams and aerial photos of selected airports.
- [The Federal Aviation Administration Alaska Region website](#) offers airport diagrams and aerial photographs.

3420.1 – Airports/Landing Strips

Reference [Section 5220.7](#) of this document for a listing of Airports and Landing Strips across the Arctic and Western Alaska Area. For current runway status, Reference the latest edition of the AK Supplement to the NOAA flight information publication. Additional local information may be available by checking specific community information located the [Community Profiles](#).

3420.2 – Helospots – TBD

3420.3 – List of Certified Helicopter/Aircraft Providers

A listing of air service companies providing services is located under each community in [the Community Profiles](#). This information was extracted from the Alaska Department of Commerce, Community and Economic Development's Community Database: <https://www.commerce.alaska.gov/dcra/dcraexternal/>

3420.4 – Fuel/Maintenance Sources

Fueling Facilities: Fuel (automotive, marine, and aircraft) is available in most major communities within the Arctic and Western Alaska. Fueling facilities for vessels can typically be found at any small boat harbor or marina. Aviation fuel is especially limited in the smaller communities. Therefore, response in the smaller communities and in remote areas will require a fuel dispensing barge or portable device (bladder, fuel trailer) on-scene to replenish vessels, equipment, and aircraft. The distance traveled and the available cargo load for aircraft may require the establishment of fuel caches.

In order to assure maximum flight times and loads, remote fueling depots may be required and established at float plane landing areas or beaches, with proper landowner and resource trustee approval. Charter air services operating within the region can provide valuable information relative to this requirement. For helicopters, deck barges can be outfitted for refueling. The *GCR & Associates, Inc.* website has data from the National Flight Data Center FAA Airport Master Record (Form 5010), including the availability of fuel at airports: www.gcr1.com/5010web/

Maintenance Facilities: Facilities providing extensive maintenance or repair have varied availability across the Arctic and Western Alaska Area. Extended operations not in the immediate vicinity of maintenance facilities will require that self-contained facilities be brought on scene. The RP may need to provide such facilities aboard barges or other means.

The National Weather Service (NWS), which is part of the National Oceanic and Atmospheric Administration (NOAA), can provide current and forecast weather for the marine environment. [Reference below](#) for contact information and website links to access real time weather, tides, currents and ice information.

4220.1 – Major seasonal patterns

4220.1.1 – Aleutians

The following information (graphs and illustrations) were extracted from a NOAA provided at the National Academy of Science Aleutian Islands Oil Spill Risk Assessment Scoping meeting held in Anchorage on October 29-30, 2007.

The following information gives an overview of wind, tide and current conditions in the southern Bering Sea. Much of the available data is general in nature and should be supplemented by area-specific updates and information from local residents. Included in this section are maps of net surface currents. In addition, if the user obtains a current edition of the NOAA tide current tables for the Pacific Coast of North America, it will be possible to predict the times of ebb and flood tides for several points within the Bering Sea.

1. Current Data:

- **North Aleutian Shelf:** The primary flow of water into the Bering Sea originates at Unimak Pass. The source of this flow is the Alaskan Coastal Current, from south of the Aleutians. Typically, this current flows to the northeast into Bristol Bay in the direction of the prevailing wind. At times, the north Aleutian coastal current will undergo a reversal in direction due to changes in the large scale and mesoscale wind direction.

- **Central Bering:** West and northwest of the North Aleutian Basin and Yukon Delta lies St. George Basin, the Central Bering Sea, and still further west, the Navarin Basin. Circulation in these regions is not as well understood as in the coastal basins. Data is site-specific and sporadic over decades. No consistent flow patterns have emerged as representative of the regional circulation.
 - **Aleutian Islands:** The accompanying current diagram shows the Alaska coastal current, which joins the Alaska stream in flowing west along the southern boundary of the Aleutian Islands. Most of the exchange of water through the Aleutian passes is from the North Pacific Ocean to the Bering Sea during both summer and winter, although local reversals are known to occur.
2. Tidal Current: Although tidally induced currents are factors in determining net surface currents, tidal currents are not usually important in long distance transport since they are oscillatory in nature. Wind and freshwater runoff are additional variables, which must be taken into account when estimating spill trajectories. In some cases, tidal currents will be counteracted by these variables and will not be the deciding factor in spill transport.
 3. Spill Trajectory: The trajectory of a spill is the result of the interaction of these several forces. This interaction is often complex and difficult to predict. NOAA is capable of generating sophisticated spill trajectory models and has had considerable experience in this area. Requests for this service should be directed to the NOAA Scientific Support Coordinator
 4. Ice: In the Bering Sea, the sea ice generally begins as fast ice formation along the shores of the Seward and Chukotsk peninsulas in October. As the season progresses and waters in the more open portions of the Bering Sea cool, the pack ice generally begins its seasonal southward formation in November. An estimated 97% of the ice in the Bering Sea is formed within the Bering Sea; very little is transported south through the Bering Strait. During periods of increasing ice and prevailing northerly winds, the ice apparently is generated and moves southward with the wind at as much as 1 knot before melting at its southern limit. During periods of southerly winds, ice coverage generally decreases in the Bering Sea, causing a wide variation in ice cover from month to month and from year to year. No seasonal ice develops along the Aleutian Islands, and there is a 25% probability that the Bering Sea ice edge may extend south to the Pribilof Islands during the months of February through April.

Structural icing of ships and port facilities due mostly to freezing ocean spray during the winter can cause problems.

4220.1.2 – Bristol Bay

The following is an overview of, tide, current, and ice conditions for the Bristol Bay geographic zone. Much of the available data is general in nature and should be supplemented by area-specific updates and any information available from local residents. Included herein are tidal ranges, and data on ice conditions

and surface currents. Using the current edition of the U.S. Department of Commerce National Oceanic and Atmospheric Administration tide current tables for the Pacific coast of North America, it is possible to predict the times of ebb and flood tides for points within this region.

1. Currents: General current patterns in the Bristol Bay geographic zone are illustrated in the following figures. Tides in the region are predominantly mixed, i.e., there are two high and low waters each day.
2. Winds: In many cases, spill trajectory is determined primarily by winds, especially when currents are weak. Winter winds are typically from the north with an average velocity of 9 to 11 knots. Summer wind speeds are similar, but winds are typically from the south.
3. Sea Ice Conditions: Ice begins forming in the sheltered lagoons of Bristol Bay between late October and November. The pack ice generally begins its southward migration in November. In some years the southern edge of the pack ice may extend into parts of Bristol Bay by January; the ice typically recedes northward by March or April. Ice clears from shorelines first, but remains in bays longer than the open sea.
4. Spill Trajectory Modeling: The behavior of spilled oil on water is the result of the complex interaction of the forces described above. Accordingly, trajectory modeling can be difficult. The National Oceanic and Atmospheric Administration is capable of generating computerized spill trajectory forecasts. Requests for this service should be directed the NOAA Scientific Support Coordinator.

4220.1.3 – Cook Inlet

The following information gives an overview of wind, tide and current conditions in the Cook Inlet Region. Much of the available data is general in nature and should be supplemented by area-specific updates and information from local residents. Included in this section are maps of net surface currents.

Physical Features: Cook Inlet is a large, elongated body of water oriented in a southwest to northeast direction in southcentral Alaska. It is approximately 150 miles long, and its width ranges from about 10 miles between the East and West Forelands in the north, to approximately 80 miles between the Kenai Peninsula and the mouth of the McNeil River in Kamishak Bay, toward the south. The inlet experiences the second largest tidal fluctuations in the world, frequently exceeding twenty feet, with tidal current velocities as fast as 8 knots (Sienkiewicz et al, 1992). Tidal flats are a dominant coastal feature along Cook Inlet, although marshes, rocky shores, sand and gravel beaches, and wave-cut platforms are also quite common.

Climate: The Cook Inlet area climate is generally transitional, having properties of both a maritime and a continental climate. As moisture-laden air masses from the Gulf of Alaska are lifted by the Kenai

Mountains, condensation forms rain or snow. Most of the precipitation is deposited on the windward side and tops of the mountains. The Cook Inlet area receives an average of 24.81 inches of precipitation a year, with an annual average of 16 inches in Anchorage. Snow is likely from October through April. The driest period is typically April through June.

A 1995 Minerals Management Service report on the Cook Inlet area noted that, generally, an inland high-pressure cell characterizes winter with frequent storm progressions from the west along the Aleutian chain. During summer, low pressure develops over the inland area, with reduced storm passage. Summer and fall are characterized by a transition between these generalized patterns (MMS, 1995).

Air temperatures are generally mild for these latitudes and reflect the influence of the land and sea. Without the moderating effects of the Gulf of Alaska, air mass temperatures of the upper Cook Inlet Geographic zone are more extreme, as noted in a 1977 NOAA study. Occasionally during the winter months, this area will experience short periods of extreme cold and/or high winds when strong pressure gradients force cold air southward from interior Alaska. January is usually the coldest month, and temperatures in the continental location such as Anchorage and Kenai see temperatures below 0 F for 10 to 15 days that month. Temperatures warm noticeably starting in April.. Figure E-14 shows the maximum, minimum, and mean temperatures throughout the year for four locations around Cook Inlet: Anchorage, Nikiski, Flat Island Light (at the tip of the Kenai Peninsula), and East Amatuli Island Light (in the Barren Islands). The graphs are based on shore station data for 2007-2011.

The prevailing winds in Cook Inlet are generally from the north and northeast during the fall, winter, and spring, with common speeds between 0 and 11 knots. Conversely, southerly winds are more frequent during the summer months (NOAA, 1977), with prevailing storm tracks from the southeast. Storms and williwaws (which blow down from the mountains) can cause gales, particularly in early winter. Figure E-15 summarizes the average and maximum wind speeds for four locations around Cook Inlet (Anchorage, Kenai, the Homer Spit, and East Amatuli Island Light in the Barren Islands) for each month.

The surrounding mountains influence wind patterns. On the western side of Cook Inlet are the Alaska and Aleutian (Alaska Peninsula) Ranges; on the eastern side are the Talkeetna, Chugach, and Kenai Mountains. The strongest surface winds occur in the coastal area. Offshore winds average between 12 and 18 knots; the winds are slightly less onshore because of surface friction. Extremes of 50 to 75 knots are common in the winter and can exceed 100 knots when channeled. Channeling occurs when surface features constrict winds. For example, water may flow in a wide ocean channel at a speed of five knots. If the channel narrows, the speed of the current increases in order to carry an equal volume of water in an equal amount of time. Wind reacts the same way. Valleys or mountain passes form narrow channels.

Under conditions common in the coastal mountains of Southcentral Alaska, wind speed may double or triple in narrow mountain channels. Ships traveling in the Gulf of Alaska have reported narrow bands of extremely strong winds flowing out of the valleys perpendicular to the Chugach Mountains. The strong winds found in the Turnagain Arm and Matanuska Valley are examples of channeled winds.

Geology: Sporadic periods of glacial advance and retreat have resulted in complex geologic strata and horizons in the Kenai lowland, the west side of Cook Inlet, Susitna Valley, and west Anchorage. Glaciers are responsible for many distinctive land features such as alpine troughs, scraped and scoured valley floors, and broad outwash plains. Drainage patterns and glaciers often follow faults, carving out valleys and exposing ancient layered plains. The complex mixture of gravel, sand, silt, and clay deposited by

glaciers is called till. The most common glacial deposits found in the region are moraines that are composed of glacial till laid down in fairly regular, low, linear hills at the edges of glaciers.

The coastal lowlands from Point Possession to the head of Kachemak Bay, including Kenai, Soldotna, and Homer, generally include low rolling glacial moraines and depressions filled by lakes and muskeg. Many rivers and streams flow through this area. Soils range from gravely clay loam to gravely sand mantled with silty material and bands of volcanic ash.

On the west side of Cook Inlet the coastal lowlands between Tuxedni Bay and Granite Point consist of nearly level, poorly drained outwash plains deposited by large glaciers in the Aleutian Range and Chignik Mountains. The outwash plains are braided with meandering and shifting stream channels. Most soils consist of sandy glacial outwash, silt, tidal sediments, and gravely river wash. The water table is high in most of this area with the exception of a few well-drained natural levees and ridges. North of Granite Point, soils and topography are similar to the coastal lowlands on the east side of Cook Inlet, with glacial moraines and depressions, pothole lakes, and soils formed from gravely clay, sand and silt.

Geologic Hazards: Cook Inlet is tectonically active, and prone to earthquakes, volcanic eruptions, and landslides. The largest historic earthquake in the area was the magnitude 9.2 Good Friday Earthquake in 1964. It is unlikely another earthquake like this will happen in the next 100 years – smaller but potentially equally damaging earthquakes from shallow faults are more likely. The Castle Mountain Fault generated its last large earthquake about 650 years ago, and on average produces an earthquake every 700 years. This fault is the largest known fault breaking the surface of the earth near Cook Inlet, and could produce violent shaking throughout Cook Inlet. Smaller faults, including those that created traps for oil in Cook Inlet, could also produce very destructive earthquakes. Loss of glacier ice may be increasing the risk of earthquakes on unknown faults near those glaciers, as the changing weight adds stress to faults that are not very active.

Volcanic eruptions are a frequent occurrence along the shores of Cook Inlet. Mt. St. Augustine, Mt. Redoubt, and Mt. Spurr have all produced eruptions in the past few decades, each with ash fall-out in populated areas. In 1989 and 2009, eruptions on Mt. Redoubt caused mudflows that impacted the Drift River Facility. In the recent geologic past, these volcanoes have been prone to larger eruptions and mud slides than we have seen historically, and there is a chance similar very large eruptions could happen again. The Alaska Volcano Observatory monitors and studies the volcanoes on Cook Inlet, working to anticipate eruptions and provide advice about volcanic hazards.

Large landslides pose hazards in some areas of Cook Inlet. In the past few thousand years, the coastline of Cook Inlet has been impacted by at least three giant landslides, one resulting from failure of ancient rock layers near Chignik Bay, one from collapse of high bluffs near Homer, and one from the collapse of a side of Redoubt Volcano during an eruption. More recently, earthquakes have triggered numerous smaller slides, at least one of which produced a damaging tsunami at the tip of the Homer Spit. Glacial retreat caused a large landslide at Grewingk Lake in 1967, which produced a tsunami nearly 200 feet tall in the lake, flattening forests for miles beyond. Landslides are a potential concern anywhere where there are very steep slopes, especially with loose sediment or weak rocks.”

Oceanography:

Bathymetry: Cook Inlet is a semi-enclosed coastal body of water having a free connection to the open sea and within which the seawater collides with freshwater from land drainage. Cook Inlet channels, coves,

flats, and marshes are nourished by the constant mixing of terrestrial source waters and marine waters of Shelikof Strait and the Gulf of Alaska (MMS, 1995).

The bottom of Cook Inlet is extremely rugged with deep pockets and shallow shoals. The depths in the upper inlet north of the Forelands are generally less than 120 feet, with the deepest portion located in Trading Bay, east of the mouth of the McArthur River. South of the Forelands, two channels extend southward on either side of Kalgin Island and join in an area west of Cape Ninilchik. South of the cape, this channel gradually deepens to approximately 480 feet and widens to extend across the mouth of Cook Inlet from Cape Douglas to Cape Elizabeth (KPB, 1990:1-4). The bottom of Cook Inlet consists predominately of cobbles, pebbles, and sand with minor proportions of silt and clay.

NOAA navigational charts indicate the depths in Cook Inlet range between 30 and 60 fathoms (180 and 360 feet) in the lower portion of the Inlet, between 20 and 30 fathoms (120 and 180 feet) in the middle section (between Anchor Point and the Forelands), and between 5 and 15 fathoms (30 and 90 feet) in the upper portion of the inlet. However, the charts also indicate the presence of reefs, mud flats, and shoals along the middle section of Cook Inlet, particularly around Kalgin Island and near Trading Bay.

Tides & Currents: Hydrographic surveys have indicated a net inflow of relatively clear, saline water from the Gulf of Alaska along the eastern side of the lower inlet, while relatively fresh, silt-laden water flows out the inlet on the west side.

Tides in Cook Inlet are semidiurnal, with two unequal high tides and two unequal low tides per tidal day (24 hours, 50 minutes). The mean diurnal tidal range varies from 18.7 feet at Homer to 29.6 feet at Anchorage. This high tidal range distinguishes Cook Inlet's coastal ecosystem from others in the Pacific Northwest.

The mixing of incoming and outgoing tidewater, combined with freshwater inputs, is the main force driving surface circulation (MMS, 1995). Strong tidal currents and inlet geometry produce considerable cross currents and turbulence within the water column. Tidal bores of up to 10 feet have occurred in Turnagain Arm. Bottom current speeds of 1.2 to 1.8 knots can be estimated from the formation of sand bottom waves in the mud flats. Current velocities are also influenced by local shore configuration, bottom contour, and, possibly, wind effects in some shallow areas. Maximum surface current speeds average about three knots in most of the inlet, but currents may exceed 6.5 knots in the Forelands area and speeds of up to 12 knots have been reported near Kalgin Island and Drift River.

There are many tidal rips in Cook Inlet, including three major ones that are persistently found east of Kalgin Island between Anchor Point and the Forelands. These major tide rips are known as the East Rip, the Mid-Channel Rip, and the West Rip. A tide rip, as defined by David Burbank in *Environmental Studies of Kachemak Bay and Lower Cook Inlet* (1977), is a frontal zone (separating different water masses) along which convergence of surface water occurs. Such convergence generally results in the more dense water mass flowing underneath the less dense, leaving floating debris behind at the surface and thereby producing the accumulations of debris found along the rips. These zones of convergence are also normally accompanied by considerable horizontal shear, manifested by sharply differing current velocities on either side of the frontal zone. The major rips (frontal zones) thus constitute natural tracers delineating the boundaries between differing surface currents.

Tide rips are significant features of Cook Inlet that can affect an oil spill response, since not only do they vary throughout a 24-hour period, but they extend from north of the Forelands to lower Cook Inlet. In

fact, the dominant rip, the Mid-Channel Rip, may extend as far south as Shelikof Strait. The Mid-Channel Rip, in the region south of Ninilchik, generally forms the dividing line between clear oceanic water in the eastern inlet and the relatively fresh, silt-laden water in the western inlet (Burbank, 1977). During flood tides, these rips strengthen, and debris is consolidated by the strong surface water convergence, especially along the major rips. Along the zone of the Mid-Channel Rip, a turbulent region of boiling water and large waves is produced. The intensity of the convergence is such that the roaring noise produced by the turbulence can be heard up to 1/4 nautical mile away. Fishing nets and logs are sometimes observed to be pulled under, surfacing again some distance away. During ebb tide, however, the energy is reduced, allowing collected debris to be spread out as far as 1.5 nautical miles (3 km). The debris can be entrapped for days in this cycle.

Sediment and Salinity: Cook Inlet receives immense quantities of glacial sediment from the Knik, Matanuska, Susitna, Kenai, Beluga, McArthur, Drift, and other rivers. This sediment is redistributed by the intense tidal currents. Most of this sediment is deposited on the extensive tidal flats or is carried offshore through Shelikof Strait and eventually deposited in the Aleutian trench beyond Kodiak. Powered by the Alaska Coastal Current, sediments of the Copper River drainage drift into lower Cook Inlet and Shelikof Strait where they eventually settle to the bottom. Recent survey results of the MMS indicate that about half of the bottom sediments in Shelikof Strait are from the Copper River.

Longshore transport of sediment within Cook Inlet is generally up the inlet, although Kamishak, Tuxedni and Kachemak Bays are areas where this trend is reversed. Homer Spit, in fact, is maintained by longshore sediment transport from the north. Rain and snow events and glacial dam flooding also deposit significant amounts of sediment into Cook Inlet.

Salinity increases rapidly and almost uniformly down the inlet, from Point Possession to East and West Foreland. Slightly higher salinities are found on the east side. This rapid increase can be attributed to heavily loaded glacial runoff from the Matanuska, Susitna and Knik Rivers and subsequent sediment settling in upper Cook Inlet. Local areas of depressed salinity occur off the mouth of large glacially-fed streams, such as the Tuxedni, Kenai, and Kasilof Rivers.

Water Temperature and Ice Conditions: The water temperature in upper Cook Inlet varies with season from 32° to 59° F. The lower Cook Inlet is affected by the intrusion of warmer waters from the Gulf of Alaska; temperatures range from 42° to 50° F.

Sea ice is normally present in upper Cook Inlet from December through March, and occasionally from November to as late as April. During winter, 100 percent ice coverage may be found in some areas in upper Cook Inlet, and substantial amounts of ice may be present as far south as Kamishak Bay. (NOAA, 1977)

While ice conditions can vary year-to-year, at least some ice is typically present around Cook Inlet between December and March. The greatest extent of sea ice coverage is likely to occur in the first half of March, according to the 2001 Marine Ice Atlas for Cook Inlet (Mulherin et al., 2001). The following figure shows the average extent of ice coverage during this period. Heavy ice may also occur within Homer Harbor (Nuka Research, 2013).

Coastal Resources: As with all areas within Alaska, the Cook Inlet region supports a wide range of wildlife. Depending upon the location within the region, many offshore areas support a highly productive marine ecosystem, rich with intertidal, benthic, and pelagic plant and animal life, which supports extensive

populations of marine and anadromous finfish, shellfish, seabirds, and marine mammals. An assortment of shorebirds and waterfowl utilize the resources of the region, either as permanent residents or for nesting, wintering, or staging/feeding sites along their migratory paths. During the period when the ocean, lakes and rivers are thawed, the inland and shoreline areas become a haven for migratory waterfowl and other birds.

The rivers, lakes and streams in the geographic zone provide aquatic habitats for resident and anadromous fish important to commercial fisheries, subsistence harvests, and recreational activities. These fish resources are also a critical food source for upland populations of brown and black bears. In addition to the bears, moose, caribou, wolves, mountain goats, and numerous smaller mammals populate upland areas.

These resident and migratory populations of fish and wildlife depend on the availability of appropriate habitat and environmental conditions in order to exist in the Cook Inlet Geographic zone. A healthy coastline and continued abundance of marine, intertidal, and upland food sources are vital to the survival of the animal inhabitants of the region, and extremely important to the social, economic, and cultural welfare of local human residents. For additional information on fish and wildlife diversity and abundance in the Cook Inlet Geographic zone, reference the Sensitive Areas Section in this plan.

Several communities rely on marine mammals as a traditional food source, and these mammals are present in concentrated areas during certain times of the year. Additionally, some residents engage in a subsistence lifestyle and rely heavily on the availability of the resources in the area. Any spill of significance could devastate the subsistence food harvest and seriously threaten the normal means of existence for many residents. Long-term impacts to these food resources could have a disastrous effect on Native and subsistence lifestyles. The Sensitive Areas Section provides detailed information on the specific resources vulnerable to spills and the locations of these resources within the geographic zone.

The primary factor for ice formation in upper Cook Inlet is air temperature, while the major influences in lower Cook Inlet are the Alaska Coastal Current temperature and inflow rate. Cook Inlet ice often first forms in October and melts before ice of a more permanent nature forms in the latter half of November. All ice generally disappears in early April, but some occasionally persists into May. Ice occasionally drifts as far south as Anchor Point. Ice concentrations have been observed in Kamishak Bay extending outward to Augustine Island. Chinitna, Tuxedni and other western Cook Inlet bays may also have occasional ice cover.

WEATHER CHARACTERIZATION IN THE COOK INLET: Winds near the coast are only slightly less variable than over the open sea. As this coastline is irregular, with many islands, channels, and inlets, and is often steep, there are strong local effects to both wind speed and direction. In general, prevailing winds set parallel to the coastline, while speeds are increased by funneling effects or decreased by blocking.

The gale frequencies of less than one percent at the Port of Anchorage can be misleading since they are usually much more sheltered than their approaches. This is reflected in the frequencies of calms, which range from 12 to 40 percent during the winter season. Storms and williwaws are responsible for the gales that are most likely in early winter. Williwaws, which blow down from the mountains in winter, occur along most of the coast; they are particularly severe at Seward. Extreme sustained winds have reached 66 knots at Anchorage. Gusts of 60 knots or greater occur almost monthly during the winter season.

In general, northeasterlies and easterlies prevail in Cook Inlet. In Cook Inlet, winds are most frequent from the north, with topography causing deflections to the northwest and northeast in some sections. At Anchorage, winter northerlies give way to southeasterlies and southerlies from May through September. At Kenai, northerlies prevail in winter, although gales are often out of the east in early winter and southeast later on; summer winds blow out of the south through southwest. At Homer, winter northeasterlies give way to summer southwesterlies.

Precipitation along this coast is also greatly influenced by topography. The annual average is 16 inches (406 mm) at Anchorage. Snow is likely from October through April. At Valdez, an average of 67 inches (1702 mm) falls in January compared to 7 inches (178 mm) at Kenai. April through June is often the driest period.

Poor visibilities are mainly caused by advection or sea fog in the summer, and land fog or precipitation in winter. In general, sea fog affects exposed ports, while land fog is more of an influence at sheltered spots. However, visibilities are most likely to drop below one-half mile on winter mornings, even at exposed ports. Land fog can be very dense for short periods. Fog banks frequently hang over open waters after the harbors have been cleared. Occasionally in winter, if extremely cold air moves over the water, a steam fog or frost smoke may be experienced as relatively warm water evaporates into much colder air.

Air temperatures are mild for these latitudes and reflect the influence of the land and the sea. The more continental ports have a wide daily and annual temperature spread compared to those exposed to the sea. A noticeable cooling begins in September, when daytime highs average in the low to middle 50's °F (11° to 14°C), with nighttime lows in the lower forties (5° to 6°C). January is usually the coldest month and is the time when the difference between exposed and sheltered locations is most noticeable. In the sheltered Cook Inlet, average maximums are in the low twenties (-6° to -4°C), while minimums drop to about 5°F (-15°C) or less. At Seward, daytime highs average 30°F (-1.1°C), with nighttime lows of 18 F (-7.8°C). At continental locations like Kenai and Anchorage, temperatures fall below 0°F (-17.8°C) on an average of 10 to 15 days in January, compared to 3 days at Seward. Freezing temperatures, also more frequent at sheltered locations, are common from October through April. Extreme low temperatures range from a -24°F (-31.1°C) at Homer to a -48°F (-44.4°C) at Kenai. A noticeable warming begins in April, and the difference between the two types of locations becomes less noticeable. Daytime highs in the low to mid-forties (5° to 8°C), and nighttime lows in the upper twenties to low thirties (-2° to 1°C), are common. July and August are usually the warmest months. Maximums average in the low to middle sixties (16° to 19°C), while minimums are frequently in the mid- to upper forties (7° to 9°C). It is often warmest at the more sheltered ports. Extreme highs reach the mid- to upper eighties (29° to 32°C).

Ice is most often a problem along this coast in Cook Inlet. The upper end is usually closed by ice to all but heavily built vessels, from December until late March. Elsewhere in the rivers and bays, waters partially freeze after December 1, and some floating ice is seen through May. This ice usually does not interfere with navigation.

4220.1.4 – Kodiak

Oceanographic conditions for the Kodiak Archipelago can be split into two regimes. Areas inside the continental shelf break, such as Shelikof Strait and Cook Inlet, are dominated by local runoff, winds and tides. The offshore areas beyond the continental shelf break are dominated by the Alaska Stream, a permanent current fixture flowing to the southwest between one to two knots off the Kodiak shelf. It is the northern branch of a large counterclockwise cell, the Pacific Subarctic Gyre. The gyre extends seaward off the shelf break from British Columbia north to Alaska and westward along the south side of the Aleutian chain. ([Reference figures below](#))

The major current feature on the shelf is the narrow, intense Alaska Coastal Current (ACC). For most of the year, this is driven by the large volume of fresh water that enters the system from Southeast Alaska and the Gulf of Alaska. The largest current velocities occur during the fall when runoff is at a maximum. Off the Kenai Peninsula, the ACC is 20 to 30 km wide and constrained by bottom topography to traverse an arcuate, east-west path across lower Cook Inlet. Off Cape Douglas, this flow merges with a weaker, southward current generated by the freshwater input to upper Cook Inlet, creating a convergence zone and a particularly intense southward flow off Cape Douglas.

The resulting flow through Shelikof Strait is southwesterly, with the ACC inducing a strong mean flow on the Alaskan Peninsula side with speeds of 0.2 to 0.5 knots. This flow continues to the southwest in a well-defined channel bounded by relatively shallow banks. Current observations suggest that the ACC bifurcates near the Semidi Islands, with one branch flowing along the Peninsula and the other merging with the Alaska Stream some 220 km southwest of Kodiak Island.

Unlike Cook Inlet to the north, tidal current effects in Shelikof Strait and on the southeast, or outer, side of Kodiak Island are minimal. The spring high-tide level throughout Shelikof Strait attains a coastal height of 13 to 16 feet and does so all within a 30-minute timeframe. Similarly, the coastal spring high tide on the outer Kodiak coast is 8 to 10 feet, occurring within approximately 40 minutes. As a result, no significant water-height gradients develop parallel to the length of Kodiak Island on either its Shelikof or outer side. The tidal currents throughout Shelikof Strait and the outer Kodiak Island coasts are thus small.

The semi-diurnal movement of water into and out of Shelikof Strait, though, creates some very significant tidal currents in the passes through and around the ends of the Kodiak archipelago. These areas, whose tidal velocities range 3 to 5 knots, include Kennedy Entrance, Stevenson Entrance and Shuyak, Kupreanof and Sitkinak Straits.

Historical wind data for the marine area east, west, and north of Kodiak Island show no dominant direction prevailing for more than one month of the year. However, at the town of Kodiak, northwest winds dominate for eleven months of the year, particularly from September through April. During the summer, northeasterly and northwesterly winds appear to be roughly equally dominant. Mountains throughout this region often create localized, channeled winds that may be at large angles to the regional climatic winds.

In 2009, NOAA's National Current Observation Program completed a major current meter survey in Alaska, which oversaw the deployment of acoustic Doppler current profilers around the islands of Kodiak,

Afognak and Sitkinak, Shuyak and Kupreanof Straits, Larsen Bay, and Geese Channel. This data provides information to enhance safe and efficient navigation, resource protection, and incident prevention and response and is published annually in the U.S. Tidal Current Tables. Additional NOAA tides and Currents available at: <http://tidesandcurrents.noaa.gov>

4220.1.5 – North Slope

The following is an overview of wind, tide, ice and current conditions in the Beaufort and Chukchi Seas. Much of the available data is general in nature and should be supplemented by area-specific updates and any information available from local residents. Included herein are wind data, tidal ranges, data on a variety of ice conditions and maps of net surface currents. Using the current edition of the U.S. Department of Commerce National Oceanic and Atmospheric Administration tide current tables for the Pacific coast of North America, it is possible to predict the times of ebb and flood tides for points within this region.

1. Sea Ice Conditions

Chukchi Sea: Sea ice within the Chukchi Sea is mostly first-year ice, with multi-year ice occurring most commonly in northward and westward areas. Ice forms between October and early December. A persistent polynya (a recurring area of open water in ice-covered regions) occurs along the eastern edge of the Chukchi Sea from the Cape Thompson area south of Point Hope to an area slightly north of Point Barrow. The Chukchi Polynya is an important pathway for migrating bowhead and beluga whales, polar bears and walrus, and for eiders and other birds in the spring before the ice opens elsewhere.

Currents and winds keep the polynya open between the fast ice and the pack ice. Stable fast ice typically extends from shore outward as far as the 20 m contour along the edge of the Chukchi Polynya. First-year ice forms along the edge of the polynya during the winter. The average width of the polynya between February and April is about 1 km or less. The polynya is wider at its southern end, and by June has an average width of 75 km near Point Lay. By August, its average width at Point Lay is 300 km. Spring or summer storms may move the pack ice toward shore at times, and reduce the extent of the polynya. Maximum ice retreat occurs in September and the area of the polynya at this time is essentially open water.

Beaufort Sea: Ice in the Beaufort Sea is less dynamic than that in the Chukchi Sea. Ice begins forming in late September or early October and extensive areas of fast ice form in late October and November. Ice within the barrier islands generally is stable for most of the ice season. Grounded fast ice occurs within the 2 m isobath and floating ice occurs from the 2 m isobath to the 15 or 20 m isobath. The flaw zone occurs at the interface between the fast and the pack ice. In March or early April, a lead usually opens in the Beaufort Sea from Point Barrow to Banks Island in the Canadian Beaufort Sea and is used by migrating whales and polar bears. In late May or early June, North Slope rivers break up and floods over the fast ice surrounding their deltas. This warm freshwater serves to hasten the decay of the fast ice in these areas. Breakup of fast ice occurs in June and July, with most of the ice inside of the 10 m isobath melted by mid-July. Concurrently, the pack ice decays so that its southern edge consists of broken floes rather than continuous ice. The maximum extent of open water occurs in mid to late September. Winds may move the ice back to shore at any time during summer.

2. Current Data:

Tidal observations along the Chukchi and Beaufort Sea coast are scattered and therefore considered too sparse to draw a consistent picture of the tide distribution. The attached table provides tide data for the

Chukchi and Beaufort Seas. However, all theoretical models of tides must be verified with observations at tidal stations.

Chukchi Sea: As indicated in the following figures, a warm current enters the Chukchi Sea via Bering Strait and flows around Point Barrow to approximately 148°-152°W in the Beaufort Sea. In the Chukchi, this current concentrates near the surface and overlies dense, relict bottom water trapped by the shallow depths. It has a fairly uniform velocity, which averages 45 centimeter per second (cm/s) in the summer and 10 cm/s in winter. This flow has many meanders, eddies, and is slowed somewhat by dominant northeasterly winds. To the east, in deeper waters, the warm water mass descends to mid-depths. Maximum temperatures are observed in 30- to 50-m depths. Water movement from the Bering Strait to Cape Lisburne takes 10-15 days in the summer. Tidal currents are rotary and very weak in the Chukchi. They vary from .3 to .9 cm/s depending on the location and tidal stage. Nearshore the tidal currents appear to be small, about 1 cm/s. Kotzebue Sound currents are mostly tide- and wind-induced. Velocities through and within the sound are very slow, averaging less than 0.1 cm/s.

Beaufort Sea: As indicated the following figures, the large-scale clockwise Beaufort Gyre moves waters from the Canadian Basin westward in the deeper offshore regions. Gyre velocities reach 5-10 cm/s north of the Alaskan coast. Another dominant circulation feature is the Alaskan Coastal Current, which enters the Beaufort Sea through the Barrow Sea Canyon. Velocities are usually 10-15 cm/s to the east, but the jet frequency reverses in direction, resulting in a lower net eastward movement of about 7 cm/s.

3. **Winds:** In many cases, spill trajectory is determined primarily by winds, especially when currents are weak. Winds are typically from the east and northeast in the Chukchi Sea, with an average velocity of 5 to 35 knots. Winds are typically from the east and northeast in the western Beaufort Sea and from the east or west in the eastern Beaufort Sea. Taku winds, which typically occur in the winter along the mountains, are generally from the north or the east and are much stronger, with an average velocity of 30 to 70 knots, gusting to 100 knots. Taku wind conditions generally last from 3 days to 3 weeks.
4. **Spill Trajectory Modeling:** The behavior of spilled oil on water is the result of the complex interaction of the forces described above. Accordingly, trajectory modeling can be difficult. NOAA is capable of generating computerized spill trajectory forecasts. Requests for this service should be directed to The NOAA Scientific Support Coordinator

4220.1.6 – Northwest Arctic

The following is an overview of wind, tide, ice, and current conditions from the Bering Sea to the Chukchi Sea, including the Bering Strait, Norton Sound, and Kotzebue Sound. Much of the available data is general in nature and should be supplemented by area-specific updates and any information available from local

residents. Included herein are wind data, tidal ranges, data on a variety of ice conditions and maps of net surface currents. Using the current edition of the U.S. Department of Commerce National Oceanic and Atmospheric Administration tide current tables for the Pacific coast of North America, it is possible to predict the times of ebb and flood tides for points within this region.

Sea Ice Conditions:

Bering Sea: The sea ice generally begins as shore fast ice formation along the shores of the Seward and Chukotsk peninsulas in October. As the season progresses and waters in the open portions of the Bering Sea cool off, the pack ice generally begins its seasonal southward formation in November. An estimated 97% of the ice in the Bering Sea is formed within the Bering Sea; very little is transported south through the Bering Strait. During periods of increasing ice and prevailing northerly winds, the ice is generated along the south-facing coasts of the Bering Sea and moves southward with the wind at speed of 1 knot or less before melting at its southern limit. During periods of southerly winds, ice coverage generally decreases in the Bering Sea, causing a wide variation in ice cover from month to month and year to year.

A wind-induced polynya (a recurring area of open water in ice-covered regions) immediately south of St. Lawrence Island is a frequent but undependable feature. Northerly winds cause the polynya to form in the lee of the island, as sea ice is advected to the south. The polynya can extend more than 100 miles and is frequently covered with thin ice. However, the feature is temporal, and a wind shift to southerly flow can close this area rapidly. At such times, a corresponding polynya to the north of the island is sometimes observed, but it is generally much smaller and occurs less frequently.

Norton Sound: Most of the sea ice in the northern Bering Sea and Norton Sound is first year ice that forms in situ. Most of Norton Sound is covered by sea ice in November through May and into part of June. Relatively persistent, large polynyas form south of St. Lawrence Island, along the south coast of the Seward Peninsula between Cape Prince of Wales and Cape Nome, and in the northeastern part of Norton Sound.

Chukchi Sea: Sea ice within the Chukchi Sea is mostly first-year ice, with multi-year ice occurring most commonly in northward and westward areas. Ice forms between October and early December. Around mid-May, the seasonal disintegration of the ice cover begins as shore-fast ice and thin ice decay and loosen along the northwest coast and in the interior of Kotzebue Sound. It is not until the beginning of July that there is a significant reduction in the probability of ice cover in the southern Chukchi Sea.

Current Data: Tides in the Bering Sea are considered the result of co-oscillation with large oceans. Once inside the Bering Sea, each tidal constituent propagates as a free wave subject to Coriolis Effect and bottom friction. The tide wave propagates rapidly across the deep western basin. Part of it then propagates onto the southeast Bering shelf where large amplitudes are found along the Alaska Peninsula and in Kvichak and Kuskokwim Bays. Another part propagates northeastward past St. Lawrence Island and into Norton Sound. Over most of the Eastern Bering Shelf region, the tide is mainly semi-diurnal, but in Norton Sound, diurnal tides predominate. Over the remainder of the Bering Sea, tides tend to be mixed.

Norton Sound: As indicated in the following figures, the currents in Norton Sound are dominated by regional wind and surface pressure patterns. The highest observed flow was measured at about 50 centimeters/second (cm/s). Flow decreased with increasing depth. Oceanographic data from the mouth of Norton Sound indicate a net northward water transport, with strong seasonal differences in movement rates. Currents between the mouth of the sound and St. Lawrence Island to the west are characterized by pulsive north-south flow events having speeds of 50-100 cm/s. A typical feature is westerly flow of water

mass, varying in extent and intensity over time, along the northern coastline. The tidal component in the sound is about 50 cm/s and reverses either diurnally or semi-diurnally. Reversals are roughly north-southeast/southwest within Norton Sound. The upper- and lower-layer circulation is decoupled in the eastern sound, but less so in the western sound, where there is a monotonic decrease in speed along with a slight rotation of flow as depth increases. In summer, easterly flow enters the sound along its southern shore, curves cyclonically to the north, and is deflected west at the north coast, roughly following the bathymetry.

Bering Strait: Near St. Lawrence Island, the Bering Sea narrows into two straits, the Shpanberg and Anadyr. North of the island, the two straits merge to form the Bering Strait. Circulation here is dominated by a northward mean flow ranging from 4 to 15 cm/s, with very small tidal influences. Flow in both the Anadyr and Shpanberg is to the north, approximately parallel to the bathymetry. The flow appears to come from around both ends of St. Lawrence Island. Frequent reversals are coincidental with meteorological events. The presence of ice appears to dampen the impact of wind stress. The major driving force for the northward flow through the Bering Strait is the sea surface sloping down to the north. The normal condition is, thus, one in which sea level in the southern Chukchi Sea (in summer) is about 0.5 meter lower than in the northern Bering Sea. South flow events are driven by strong north winds, strong atmospheric pressure cells, and a change in sea-level slope to the south. These conditions apparently require about one day to develop. Northward transport stands in contrast to the southerly transport events. Periods of northerly flow tend to be more persistent and not so great in magnitude.

Chukchi Sea/Kotzebue Sound: As indicated in the following figures, a warm current enters the Chukchi Sea via Bering Strait. In the Chukchi, this current concentrates near the surface and overlies dense, relict bottom water trapped by the shallow depths. It has a fairly uniform velocity, which averages 45 cm/s in the summer and 10 cm/s in winter. This flow has many meanders, eddies, and is slowed somewhat by dominant northeasterly winds. To the east, in deeper waters, the warm water mass descends to mid-depths. Maximum temperatures are observed in 30- to 50-meter depths. Water movement from the Bering Strait to Cape Lisburne takes 10-15 days in the summer. Tidal currents are rotary and very weak in the Chukchi. They vary from .3 to .9 cm/s depending on the location and tidal stage. Nearshore, the tidal currents appear to be small, about 1 cm/s. Kotzebue Sound currents are mostly tide- and wind-induced. Velocities through and within the sound are very slow, averaging less than 0.1 cm/s.

Winds: In many cases, spill trajectory is determined primarily by winds, especially when currents are weak. Throughout the Bering, the wind is fairly strong year-round but blows the hardest in winter.

Prevailing summer winds blow from the south or southwest at 7 to 10 knots. Winter winds generally come from the east or northeast at 10 to 15 knots, and can persist in one direction for weeks at a time causing a wide variety of water and ice movement. Winds are usually stronger at St. Lawrence Island (averaging 15.5 knots) than along the mainland. Maximum-recorded sustained wind speed at Nome is 78 knots and 92 knots at Unalakleet. Even strong winds offshore may reach speeds of 100 knots and create large waves in Norton Sound.

Physical Features: The Northwest Arctic Geographic zone has an irregular shaped coastline, with many sounds, inlets, bays, lagoons, islands, rivers, peninsulas, spits, points, and capes. There are many rivers that flow out of the following mountain ranges: the southwest end of the Brooks Range, Delong Mountains, Baird Mountains, Schwatka Mountains, Waring Mountains, Selawik Hills, Purcell Mountains, York Mountains, Kigluaik Mountains, Bendelben Mountains, Darby Mountains, Kaiyuh Mountains, and

Nulato Hills. The majority of these rivers empty into the salt waters of this geographic zone. The primary orientation of these mountain ranges are east to west.

Most of the communities of this geographic zone are located on the coast or can be found inland on river ways. The major river ways associated with the communities of this geographic zone are the Noatak River, Kobuk River, Selawik River, Buckland River, and Koyuk River.

The geographic zone has many small lakes that are mainly found in the lowlands within watersheds and just inland of coastal regions. The three largest lakes within the Geographic zone are Selawik Lake, Inland Lake, and Imuruk Lake.

Climate: Most of the communities in the geographic zone are coastal and experience a maritime climate while the surrounding waters are ice-free around May through October. During these ice-free months cloudy skies are common, daily temperatures are fairly uniform, the predominate wind direction is from the west, humidity is higher, and fog is common due to the temperature difference of the water and the surrounding land mass. Most of the precipitation that falls occurs during these months

When the water in coastal regions freezes the climate changes to be more like that of a continental climate, with large fluctuations in temperature. As more and more open water freezes, the shift to a continental type environment becomes more pronounced. During these months, cyclonic storms are more abundant and accompanied by high winds and blizzard conditions. Most of these months have light snowfalls, but the fallen snow is often reactivated and windblown long distances away from where it originally fell.

The mountain ranges in the geographic zone are for the most part oriented west to east and do little to block the year round westerly winds. The mountains in the area provide a barrier from the cyclonic storms coming from the south to the communities located proximally to their northern edges. The mountains also provide a barrier to arctic storms coming from the north for the communities that lie to their south.

Geology: Most of the communities in this area are located in lowlands near the coast and rivers. The lowlands in this area are covered in vegetation growing on unconsolidated sands, gravels, and muds, which are associated with fluvial, glaciofluvial, colluvial, and eolian deposits. These unconsolidated sediments were deposited in the Quaternary, Pleistocene, and uppermost Tertiary time periods. Some of these sediments such as those found around Nome are associated with placer gold deposits.

This area has many mineral resources associated with bedrock outcrops in the mountainous regions of this area. Communities have sprung up and disappeared with the mining of these resources. Due to the remoteness of this area, and lack of infrastructure like roads and deep-water ports, it is economically difficult to extract these mineral resources. Currently Red Dog Mine, a zinc and lead mine located on the southern foothills of the Delong Mountains, is the largest operating commercial mine in this area. Red Dog Mine is located approximately 90 miles north of Kotzebue. Red Dog Mine also has a port site, to import supplies and fuel for the mine and export zinc and lead ore concentrate, that is located about 16 miles southeast of Kivalina.

Oceanography: The primary water bodies associated with this area is the Chukchi Sea to the northwest and the Bering Sea to the west and south. The next largest water bodies are the Kotzebue Sound located to the North of the Seward Peninsula and the Norton Sound located to the south of the Seward Peninsula. The waters in the coastal regions of this area are too shallow to support a deep-water port. Deep draft

vessels that bring supplies and fuel to the communities of this area must anchor out in the deeper waters offshore and lighter their cargo to smaller more shallow drafted vessels and barges for transport to shore or up rivers. In the case of Kotzebue, one of the largest hub communities in the area, deep drafted vessels must anchor 15 miles off the coast due to the shallowness of coastal waters.

Coastal Resources: Many people in this area rely on subsistence foods. A large portion of the subsistence foods that are harvested in this area are from the sea. The primary marine species harvested in this area are bowhead whales, beluga whales, gray whales, bearded seals, spotted seals, ringed seals, polar bears, walrus, seabirds and their eggs, arctic cod, tomcod, herring, flounder, ellpouts, sculpin, salmon, trout, whitefish, and sheefish. Almost all of these species are migratory species and are often only available seasonally. It is also important to note that these species rely on the health of their ecosystem to provide enough food for them to flourish.

The figures below illustrate the areas of critical Northwest Arctic Borough (NAB) subsistence activity based on the season and include all of the species listed in the previous paragraph. Please note that the following figures are based off of traditional knowledge gathered by interviews with villagers, and that all communities' subsistence use were weighted the same regardless of community size. These figures only depict subsistence activities within the NAB boundaries and do not show the other coastal subsistence areas located in the Northwest Arctic Geographic zone that are south of the NAB boundary.

According to the Northwest Arctic Borough, 134 residents hold commercial fishing permits. The 134 permit holder number does not include other potential commercial fishing permit holders that might reside in the Northwest Arctic Geographic zone but do not live within the Northwest Arctic Borough boundary.

Impacts to the coastal areas associated with a release could be very detrimental as the ecology in this region can take a very long time to rebound from a disruption.

4220.1.7 – Western Alaska

The following is an overview of wind, tide, ice and current conditions in the Bering Sea and Kuskokwim Bay. Much of the available data is general in nature and should be supplemented by area-specific updates and any information available from local residents. Included herein are wind data, tidal ranges, data on a variety of ice conditions and maps of net surface currents. Using the current edition of the U.S. Department of Commerce National Oceanic and Atmospheric Administration tide current tables for the Pacific coast of North America, it is possible to predict the times of ebb and flood tides for points within this region.

- 1) **Sea Ice Conditions:** Sea ice generally forms off the Yukon River beginning in mid-October. Between mid-December and mid-April, sea ice coverage ranges from 70 to 100 percent. Shorefast ice reaches offshore from 15 to 60 km. In deeper waters beyond the shorefast ice, sea ice persists until April or May. By mid-June or by early July, the delta area is ice-free.

An estimated 97% of the ice in the Bering Sea is formed within the Bering Sea; very little is transported south through the Bering Strait. During periods of increasing ice and prevailing northerly winds, the ice apparently is generated along the south-facing coasts of the Bering Sea and moves southward with the wind at as much as 1 knot before melting at its southern limit. During periods of southerly winds, ice coverage generally decreases in the Bering, causing a wide variation in ice cover from month to month and year to year.

In the Bering Sea a wind-induced polynya immediately south of St Lawrence Island is a frequent but undependable feature. Northerly winds cause the polynya to form in the lee of the island as sea ice is advected to the south. A polynya can form on any side of Nunivak Island, depending upon prevailing wind direction. Usually the feature is located to the north or south, under southerly or northerly winds, respectively. Like the polynya off St. Lawrence Island, the appearance of this polynya is variable, but it is usually observed at least once a year, often more. Its extent is variable, and thin ice commonly covers the polynya quickly during cold, northerly windstorms.

- 2) **Current Data:** Tides in the Bering Sea are considered the result of co-oscillation with large oceans. Once inside the Bering Sea. Each tidal constituent propagates rapidly as a free wave subject to the Coriolis Effect and bottom friction. The tide wave propagates rapidly across the deep western basin. Part of it then propagates onto the southeast Bering shelf where large amplitudes are found along the Alaska Peninsula and in Kvichak and Kuskokwim Bays. Circulation in the northern Bering Sea and near the Yukon River Delta is dominated by a northward mean flow paralleling the local bathymetry.

- 3) **Tidal Ranges:** Tides in the Yukon River delta area exhibit a high degree of spatial variability in amplitude and phase because of the delta's complex topography. The tides are a mixture of diurnal and semi-diurnal tides depending on the location and time of year. The diurnal tidal range at the face of the delta is about 1 to 2 m. Storm surges may occur in the area during the ice-free period, particularly during autumn.
- 4) **Winds:** In many cases, spill trajectory is determined primarily by winds, especially when currents are weak. Throughout the Bering, the wind is fairly strong year-round but blows the hardest in winter. Prevailing summer winds blow from the south or southwest at 7 to 10 knots. Winter winds generally come from the east or northeast at 10 to 15 knots, and can persist in one direction for weeks at a time causing a wide variety of water and ice movement. Winds are usually stronger at St. Lawrence Island (averaging 15.5 knots) than along the mainland. Maximum-recorded sustained wind speed at Nome is 78 knots and 92 knots at Unalakleet.
- 5) **Spill Trajectory Modeling:** The behavior of spilled oil on water is the result of the complex interaction of the forces described above. Accordingly, trajectory modeling can be difficult. The National Oceanic and Atmospheric Administration is capable of generating computerized spill trajectory forecasts. Requests for this service should be directed to the NOAA Scientific Support Coordinator.

NOAA Weather Radio (NWR): National Weather Stations in Alaska can be found at the following link: <http://www.nws.noaa.gov/nwr/coverage/stations.php?State=AK>. These VHF FM radio stations are managed by the National Weather Service. Forecasts are issued at scheduled times; broadcast tapes are updated and amended as required. The broadcasts, in general, contain forecasts and warnings for the local area and nearby coastal waters, special severe weather bulletins, tsunami warnings, a description of the weather pattern as it affects Alaska, and weather reports from selected weather stations.

More information on NOAA Weather Radio can be found at the following link:
<http://www.nws.noaa.gov/nwr/>

NOAA Weather Radio continuous voice broadcasts on **162.40** and **162.55 MHZ** can usually be received 20-40 miles from the transmitting antenna site, depending on terrain and the quality of the receiver used. Where transmitting antennas are on high ground, the range is somewhat greater, reaching 60 miles or more. The VHF-FM frequencies used for these broadcasts require narrow-band FM receivers. The National Weather Service recommends receivers having a sensitivity of one microvolt or less and a quieting factor of 20 decibels. Some receivers are equipped with a warning alert device that can be turned on by means of a tone signal controlled by the National Weather Service office concerned. This signal is transmitted for 13 seconds preceding an announcement of a severe weather warning. One can also consult the *Alaska Marine Radio Directory* for additional information.

NATIONAL WEATHER SERVICE HF VOICE WEATHER BROADCASTS

The following VOICE BROADCASTS are on the Upper Sideband (USB) 4125 KHz

* Barrow broadcasts April 1 thru September 15 only.

** King Salmon broadcasts from April 1 thru October 15 only.

Location	Station	Time of Broadcasts
Barrow*	KCB53	6:30 am and 12:00 pm
Kodiak	WHB29	8:00 am and 6:00 pm

Note: The Federal Aviation Administration (FAA) has live-feed Aviation Weather cameras in many of the communities in the region and available online at <http://avcams.faa.gov/>

USCG broadcasts National Weather Service high seas forecasts and storm warnings from six high seas communication stations. These broadcasts are prepared cooperatively by the Ocean Prediction Center, Tropical Prediction Center and Honolulu Forecast Office. Offshore and coastal forecasts are available in areas such as Alaska. Reference table below for station locations and schedules. Transmission range is dependent upon operating frequency, time of day and atmospheric conditions and can vary from only short distances to several thousand miles. Best reception can be achieved by proper selection of frequency and an adequate antenna system. A Listing of NWS Marine Products Broadcast via USCG HF Voice is available <http://www.nws.noaa.gov/om/marine/hfvoice.htm>.

Visit the [USCG Maritime Telecommunications Information](#) webpage for further information on USCG telecommunications.

4230 – Situation Unit Displays - TBD

4240 – Command and Control - TBD

4250 – Required Operational Reports

Incidents resulting in the activation of an IMT require detailed information transfer. [Reference Section 4800](#) for additional required Correspondence, Permits, Consultation and Reports that might be necessary during or after an incident.

4250.1 – ICS Form 209 - Incident Status Summary

Access the ICS Form 209 at the [USCG Homeport Website](#).

4250.2 – Pollution Reports (POLREPs)

POLREPs are prepared for pollution events of significance/potential significance and whenever the Oil Spill Liability Trust Fund has been opened. Reports are sent from the FOSC to the USCG Seventeenth District, EPA, and ADEC to provide an overview on spill response efforts. [A POLREP template can be found on the CG Portal](#).

4250.3 – Situation Reports (SITREPS)

ADEC disseminates information on ongoing emergency spill response activities through the issuance of periodic Situation Reports (SITREPs). The number and frequency of these reports, which follow a standard format, depends upon the severity of the incident and the size and scope of ADEC response activities associated with the incident. ADEC SITREPs are routinely distributed to ADEC management, the Governor's Office, and other State agencies, as well as to all appropriate stakeholders depending on the specific incident. Additional SITREPs are generated during the cleanup and recovery phase to keep interested parties informed on the progress of this aspect of the response. These SITREPS can be found on [ADEC's website](#).

4250.4 – After Action Report

In order to better evaluate the response methods used by ADEC and ensure that any problems encountered are adequately addressed, an "after action" summary report (i.e., a lessons learned report) is produced for each significant spill incident involving ADEC and other State response staff. After Action Reports are prepared through consolidating ADEC internal inputs as well as inputs from other responding State agencies.

4250.5 – Federal On-Scene Coordinator’s Report

The FOSC will submit an FOSC report as determined necessary by the ARRT for a particular incident.

4300 – RESOURCES - TBD

4310 – Resource Management Procedures - TBD

4310.1 – Check-in Procedures - TBD

4320 – Volunteers

The use of volunteers has been an item of increasing interest following several incidents of note in the United States.

The possible use of volunteers is recognized in 40 CFR 300 (the National Oil and Hazardous Substances Pollution Contingency Plan [NCP]), part 185 (c) as follows: Area Contingency Plans (ACPs) shall establish procedures to allow for well-organized, worthwhile, and safe use of volunteers, including compliance with 300.150 regarding worker health and safety. ACPs should provide for the direction of volunteers by the on-scene coordinator, remedial project manager, or by other federal, state, or local officials knowledgeable in contingency operations and capable of providing leadership. ACPs also should identify specific areas in which volunteers can be used, such as beach surveillance, logistical support, or bird and wildlife treatment. The definitions section of the NCP includes “volunteer” as follows: **Volunteer** means any individual accepted to perform services by the lead agency that has authority to accept volunteer services (examples: Reference 16 U.S.C. 742f(c)). A volunteer is subject to the provisions of the authorizing statute and the NCP.

Within the State of Alaska, the Alaska Department of Environmental Conservation (ADEC) does not embrace the concept of the use of volunteers for oil and hazardous substance response for a number of reasons, including insurance and liability issues and general accountability (the need for a dedicated work force to meet specified performance standards, availability to work as scheduled, and not as time permits, etc.).

In the case of a major spill event, the ADEC will direct the responsible party (RP) to train and hire an additional work force (volunteers may be considered, but will be hired only as paid employees) as necessary. If no RP exists (or the RP refuses to hire needed additional workers), then the ADEC will use its term contractors and proceed with emergency hiring of additional workers, as necessary. The agency will bill the RP and cost recover for any and all costs involved in the response, including the agency’s costs to bring on additional workers (e.g., paid employees, not volunteers).

Local volunteers can play an important role in oil spill response, and this is especially true in the Arctic and Western Alaska Area, where there is a wealth of local knowledge pertaining to wildlife populations, currents, tides and other environmental phenomena. During a spill emergency, it is likely that large numbers of local community members will arrive on scene, eager to participate in response activities.

A volunteer coordination plan is necessary to effectively manage and direct volunteer activities such as recruitment, training, communications and referral. This plan addresses such issues for all “unaffiliated” volunteers, or volunteers who are not already affiliated with a response organization. Affiliated volunteers should work through their respective agencies.

This plan has been modeled after the Volunteer Action Plan developed for Kenai Peninsula Borough with funding from Arco Marine, Inc. This plan is designed to deal only with volunteer coordination activities during an actual spill response.

Organization and Activation: A Volunteer Coordinator may be appointed by the Incident Commander to manage all aspects of the volunteer program, including communications, recruitment, training and referral. The Volunteer Coordinator will report directly to the Logistics Section Chief.

The Volunteer Coordinator will operate a Volunteer Referral Center (VRC), which will refer volunteers to appropriate ICS units or activities where they can apply their skills and interests. The VRC will provide initial screening, skill and training identification, and orientation. Additional screening, training and supervision will be provided by the ICS unit to which the volunteer is referred.

The facility selected to serve as the VRC may be co-located with the Command Center, or may be located nearby in a school, church, recreation center, community building, or other such facility. The facility should provide easy public access, enough room for reception and training areas, and some communication capabilities. The VRC should have basic office equipment, such as computers, telephones, fax machines, copiers, and office supplies.

Insurance and Liability: There are currently no state or borough provision for insurance/liability/worker's compensation coverage for volunteers in an emergency response. In most cases, volunteers will be working for the Responsible Party (RP) or lead agency in charge of spill response. The VRC will act only as a referral agency and will not directly supervise the volunteers, with the exception of those volunteers working in the VRC. Effective screening, training, and supervision will help to limit liability when assigning volunteers.

Training, Screening and Skill Identification: As potential volunteers contact the referral center, they will be screened and referred to ICS units based on their skills, training and certification, and availability. During response and recovery activities, response agencies or the RP may contact the Volunteer Referral Center and submit requests for volunteers.

Training, screening and skill identification will be accomplished by using the following:

- A training module that covers basic orientation to the AWA Contingency Plan, ICS organizations and functions (both general section divisions and specific unit tasks), and basic safety and communications procedures.
- A database that identifies volunteers' completed training, additional skills and certifications (HAZWOPER, wildlife hazing, etc.), and individual preferences and availability.

General Guidelines on the Use of Volunteers: The National Response Team developed guidelines for the use of volunteers in support on an oil or hazardous substance response:

- [Use of Volunteers Guidelines For Oil Spills \(2012\)](#)
- [Use of Volunteers for Oil Spills Memorandum of Understanding](#)

The Pacific States/British Columbia Task Force for Oil Spills has developed a document entitled **Planning Guidelines for Convergent Volunteer Management**, which may be viewed at the following website: http://www.oilspilltaskforce.org/docs/planning_for_volunteer_management.pdf

4320.1 – Assistance Options

During response and recovery operations, the following process will be used to identify needs, recruit, and place volunteers:

- Designate Volunteer Coordinator and establish VRC as soon as Incident Command is mounted.
- Establish and publicize toll-free phone number.
- Distribute volunteer request forms to ICS Section Chiefs (through Command Center).
- In cooperation with Public Information Officer, distribute volunteer information to local newspaper and radio.
- As volunteers contact the VRC, screen and refer them to agencies/organizations/ICS units based upon their skills, training and availability.

The Volunteer Request Form (below) should be copied and distributed to responders via the Command Center as early as possible. Responding agencies, contractors, organizations, or ICS unit leaders will use these forms to identify volunteer needs.

Convergent volunteers (volunteers arriving at the VRC or on-scene) will be directed to the VRC and asked to fill out a Volunteer Registration Form (below).

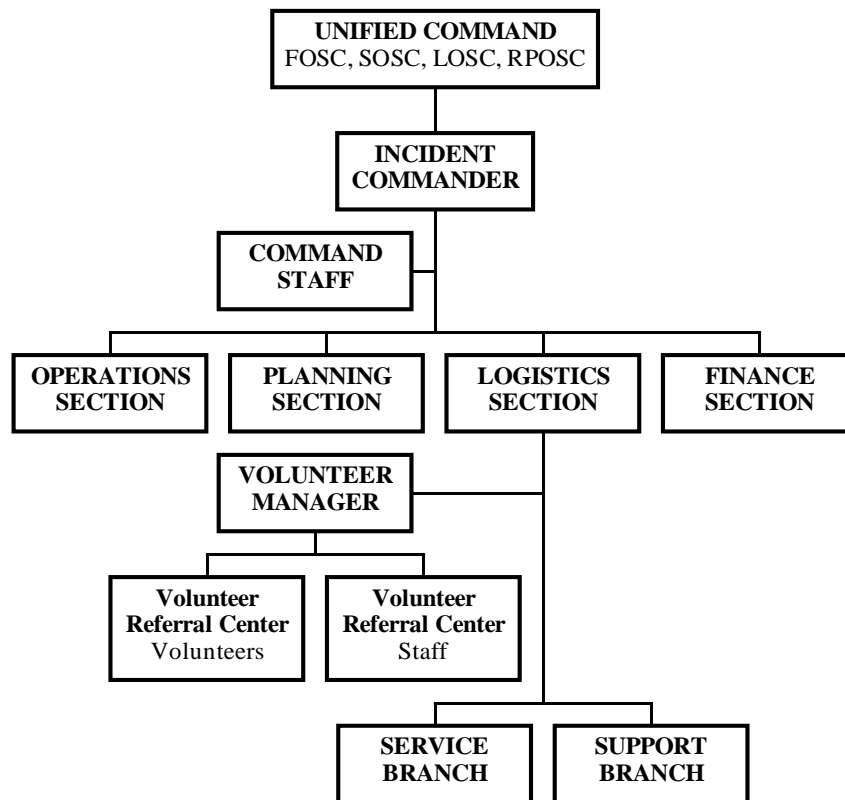

4320.2 – Assignment – TBD

4320.3 – Coordination

The Volunteer Coordinator is responsible for the implementation and management of the Volunteer Coordination Plan. It is the Volunteer Coordinator's responsibility to recognize and anticipate the potential role of volunteers in a spill response, to coordinate needs and available resources, and to manage the VRC in recruitment, identification, training, and placement of volunteers during a response.

All volunteer referral center staff and volunteers will report to the Volunteer Coordinator, who reports to the Logistics Section Chief (Reference diagram below).

Figure 4-27: Volunteers and the Incident Command System

The Volunteer Coordinator's duties may include the following:

- Serve as a liaison with the IC and Unified Command via the Logistics Section Chief to coordinate volunteer needs.
- Serve as the principal contact for all volunteers and all units/agencies needing volunteers.
- Establish and manage the VRC to include registration, orientation, placement, recruitment, training, and referrals.
- Establish a communication system, including a toll-free phone number, fax lines and fax machines, phones, and a link to the Command Center.
- Coordinate with the Public Information Officer (or Joint Information Center) to provide notification to the media regarding types of volunteer jobs available and procedures for volunteering.
- Provide safety training as necessary for all volunteers to ensure they are properly trained and equipped and in compliance with federal, state and local safety regulations.
- Coordinate with response agencies and the Responsible Party to provide additional volunteers as needed and to coordinate referrals.
- Maintain record keeping of volunteers, training and certification, hours worked, and their assigned activities.
- Provide volunteer recognition.

Volunteer Referral Center

1. Facility: the VRC should provide:

- Easy public access
- Room for training and orientation
- Basic communications capabilities and office equipment:
 - Telephones
 - 2-3 phone lines, one of which is toll free incoming only
 - Fax machine and 2 dedicated fax lines (ingoing & outgoing)
 - Communication link to Command Center
 - Access to news & information releases to media and local government in order to advertise volunteer needs and toll free number
 - Computers and printers
 - Copier
 - Maps, flip charts, bulletin boards, pens, tape, markers
 - Paper, pens, pencils, stapler and other general office supplies

2. Establishment

In setting up the VRC, the Volunteer Coordinator should consider the following:

- Arrange space to allow for foot traffic and to maximize wall space.
- Face tables and chairs so that information can be viewed easily.
- Allow enough space, pens, clipboards, etc. so that volunteers can fill out registration materials.
- Clearly identify the reception desk/area.
- Provide seating.
- Post signs directing potential volunteers to the building/room.
- In the event of a large spill response where sufficient staffing is available at the VRC and volunteer needs are extensive, set up stations for each major class of work, such as:
 - Administrative
 - Communications
 - Shoreline Operations
 - On-Water Operations
 - Wildlife Recovery/Rehabilitation
 - Repair/Construction
 - Logistical Support
- Assign early volunteers to staff the Referral Center and to be couriers to bring information about volunteer needs from the Command Center to the VRC.
- Set aside time and space for training and orientation.
- Set up an information bulletin board. This area may serve as an informal information and referral area.

Early volunteers should be used to supplement staffing of the VRC. Staffing needs at the VRC will include:

- Receptionist: answers questions, phones, gives out forms & directions
- Data Entry Clerk: enter personnel information into database
- File Clerk: files, copies, sends & receives faxes

- Intake and Referral Personnel: conducts initial screening, matches volunteers with needs
- Communications: compiles updates of volunteer needs, maintains bulletin board
- Training: coordinates/conducts general training & orientation for all volunteers
- Facility Support: maintains equipment, cleanliness, order
- Transportation: assist with transportation as needed
- Courier: serves as go-between for VRC and command center

It is essential that all volunteers are routed through the VRC. Volunteers arriving on-scene who have not first checked in at the VRC must be referred to the VRC for assignment.

It is important to track volunteers, recognize, and reward their efforts. The following are suggestions for volunteer identification, record keeping and recognition:

- Develop and maintain a database of current interested volunteers and skills using appropriate computer software.
- Develop and distribute an after-action newsletter or report to all volunteers who participated in a spill response.
- Issue identification badges to all volunteers as they are assigned to specific jobs.
- Ensure that all volunteers register at the VRC before placement in a job. Encourage unit leaders or agency personnel to document volunteer hours worked.

If a Responsible Party directs the spill response, volunteer coordination may proceed according to the RP's approved contingency plan. This plan has been designed to facilitate volunteer coordination and promote positive community involvement during all phases of a spill response. If vessel or facility operators in the area have not developed individual volunteer management plans, they are encouraged to incorporate this plan by reference into their state-approved C-plans.

4320.4 – Training

Training will be provided to all volunteers assigned to jobs during a response. If, in the future, a pre-emergency volunteer coordination program is implemented in the AWA Area, volunteers may receive ongoing training and be added to a permanent volunteer roster. This process would facilitate initial activation of trained volunteers.

Training sessions for volunteers should include:

- Basic orientation to this Arctic and Western Alaska Area Plan and the Regional Contingency Plan
- ICS structure, organization, and general and specific job requirements
- Site-specific hazards
- Environmental and cultural concerns related to the response
- Safety and security procedures
- Proper attire and safety equipment
- Safety training (Reference below)
- Liability
- Limitations on non-professionals

Training may also be provided for bird and wildlife rescue and treatment, shoreline cleanup, food distribution, check-in procedures and other response activities.

The initial volunteer training (conducted at the VRC) may be supplemented by additional position-specific training provided once the volunteer is assigned to a job.

Safety training for volunteers should address the following policies and procedures:

- Worker's compensation
- Drug and alcohol policies
- Firearms
- Equipment use
- Limitations for non-professionals
- Hazwoper
- General safety procedures (buddy system, safe lifting, etc.)
- Evacuation procedures
- Potential hazards of work environment
- First Aid
- Accident Reporting Procedures

VOLUNTEER REQUEST FORM

Date/time: _____

Requesting organization/agency/unit: _____

Name of contact: _____ Phone: _____ Fax: _____

VOLUNTEER NEEDS: Total Number of Volunteers Needed: _____

Job Title/Description: _____

Duties	Experience/Skills	Training Provided?

Equipment/Special Clothing Needs: _____

Brief Description of Training to be Provided: _____

Job Location: _____ Date/time volunteers needed: _____

Please check if available: _____ Restrooms _____ Parking

_____ Safety Equipment _____ Telephone _____ Transportation to Work Site

Volunteer(s) should report to the following person for additional training/instruction:

Name: _____ Phone: _____ Location: _____

FOR OFFICE USE ONLY:

Follow up date & time: _____ Follow up action: _____

Position(s) filled _____

Volunteer name(s): _____

VOLUNTEER REGISTRATION FORM

Name: _____ Date: _____

Phone (day): _____ (eve.) _____ E-mail: _____

Address: _____

## **4330 – Alternative Planning Criteria - TBD**

### **4400 – DOCUMENTATION**

**Minimum Requirements** - Each agency shall immediately implement document control and collection procedures. In all cases telephone logs, correspondence, reports, time records, and field notes shall be considered part of documentation. Numerical document control by all participating agencies and a mechanism for centralized document control and retention shall be instituted at the agency level. All staff shall be subject to a "Check In - Check Out" process through the Resource Unit of the Planning Section to ascertain that vital records are retained onsite.

Additional documentation and data management requirements shall vary by incident. ADEC, in conjunction with the Department of Law, shall establish the documentation and data management requirements for each incident. Attention shall be paid to cost recovery requirements. Each participating agency shall be provided written instructions by ADEC for documentation requirements in excess of minimums.

### **4410 – Services Provided - TBD**

### **4420 – Administrative File Organization- TBD**

### **4500 – DEMOBILIZATION**

#### **4510 – Sample Demobilization Plan**

[Sample Demobilization Plans](#) can be found at the USCG Homeport Website.

### **4600 – ENVIRONMENTAL - TBD**

#### **4610 – Geographic Response Strategies**

Reference [Section 9740](#) of this document for Geographic Response Strategies.

#### **4620 – Fish & Wildlife Protection Strategies**

Reference the following documents for various fish and wildlife protection information across the Arctic and Western Alaska area.

- [Wildlife Protection Guidelines for Alaska](#)
- [Sensitive Area Plans](#)

#### **4630 - Potential Places of Refuge**

Reference [Section 9750](#) of this document for Potential Places of Refuge.

### **4700 – TECHNICAL SUPPORT**

#### **4710 – Hazardous Materials - TBD**

##### **4710.1 – Sampling**

Reference ADEC's Prevention Preparedness and Response webpage for detailed information on water quality sampling methods and procedures to determine the presence/absence of oil contamination that could potentially impact the commercial fisheries of Alaska [via the Alaska Commercial Fisheries Water Quality Sampling Methods & Procedures Manual](#).

## **4720 – Oil**

### **4720.1 – Scientific Support Coordinator**

NOAA Scientific Support Coordinators (SSC) are the principal advisors to the USCG FOSC for scientific issues, communication with the scientific community, and coordination of requests for assistance from State and federal agencies regarding scientific studies. The SSC strives for a consensus on scientific issues affecting the response, but ensures that differing opinions are communicated to the FOSC. At the request of the FOSC, the SSC leads the scientific team during a response and is responsible for providing scientific support for operational decisions and for coordinating on-scene scientific activity. The SSC leads the synthesis and integration of environmental information required for spill response decisions in support of the FOSC, while coordinating with State representatives, appropriate trustees and other knowledgeable local representatives. The SSC is supported by a scientific support team that includes expertise in environmental chemistry, oil slick tracking, pollutant transport modeling, natural resources at risk, environmental tradeoffs of countermeasures and cleanup, and information management. At the request of the FOSC, the NOAA SSC may facilitate the FOSC's work with the lead administrative trustee for natural resources to ensure coordination between damage assessment data collection efforts and data collected in support of response operations.

### **4720.2 – Decontamination**

Within the State of Alaska, hospital decontamination stations have been established at a few hospitals. Field decontamination is critical prior to transporting injured workers to a medical facility. Reference the [Community Profiles](#) for the closest EMS/Hospital resources available on an incident specific basis.

### **4720.3 – Dredging**

The **U.S. Army Corps of Engineers (USACE)** can provide expertise in all disciplines of engineering. USACE can provide assistance in the areas of dredging, surveying, supply vessels, and manpower. Their expertise can also be used for clearing channels and locating obstructions. The USACE also has authority for emergency removal of obstructions to navigation. Activation of USACE resources in support of an RRT activity would be in the form of a written mission assignment that outlines the parameters of work to be done and estimates dollar authority to accomplish the mission.

## **4730 – General**

### **4730.1 – Cultural & Historic Properties**

Reference [Section 9220.4.1](#) for technical support on historic properties.

### **4730.2 – Legal - TBD**

### **4730.3 – Chaplain - TBD**

### **4730.4 – Public Health**

Reference the Personnel and Services Directory, [Section 9200](#).

### **4730.5 – Human Resources - TBD**

### **4730.6 – Critical Incident Stress Management - TBD**

## **4740 – Law Enforcement**

Reference the [Community Profiles](#).

## **4750 – Search and Rescue (SAR) - TBD**

#### **4760 – Marine Fire**

Reference the Salvage and Marine Fire Fighting Plan, [Section 8100](#).

### **4800 – REQUIRED CORRESPONDENCE, PERMITS & CONSULTATION**

#### **4810 – Administrative Orders - TBD**

#### **4820 – Notice of Federal Interest**

The FOSC is required to inform the responsible party (RP) of the U.S. Government's legal requirements when a pollution incident occurs. This function is achieved by issuing a “Notice of Federal Interest” to any and all suspected responsible parties. The U.S. Government's role in an incident is primarily oversight unless the RP fails to take adequate removal action.

#### **4830 – Notice of Federal Assumption**

The FOSC is required to notify the RP if their actions to abate the threat and remove a hazardous substance are unsatisfactory. The FOSC then assumes response management, and the RP is liable for costs incurred by the federal government. The document by which this is communicated is called a “Notice of Federal Assumption.”

#### **4840 – Letter of Designation**

The FOSC is responsible for notifying the NPFC of the source of an actual or potential discharge. The NPFC must also be notified if the source is not identified. Notification may be made by letter, rapidraft, or message. The NPFC should be contacted for procedural guidance and with any questions.

Further information on “designation of source” can be found at the [National Pollution Fund Center \(NPFC\) website](#):

#### **4850 – Permits**

This section contains a list of the various permits that could be required during oil or hazardous substance response and recovery. The Alaska Oil Spill Permits Project (AOSPP) workgroup developed a Permit Tool, which contains electronic versions of permits that may be required by State and federal agencies, listed below. It allows users to create a file with incident-specific information and exports that information into each permit form using the Adobe Acrobat® forms function. The Permit Tool also provides an example of a completed version of each form for a hypothetical incident.

If an incident occurs within the boundaries of a municipality, additional municipal permits may be required. Appropriate local government officials should be contacted to determine local permitting requirements. Some forms, authorizations, and instructions in the Permit Tool are not required by regulation, but are recommended formats for particular response activities.

The [Alaska Spill Response Permits Tool](#) is available on ADEC’s Prevention Preparedness and Response web page.

Permits can be accessed within the Permit Tool either by the agency that requires the permit or by response activity type.

**NOTE:** None of the permit applications that appear on ADEC’s website will cover permission granted by ADF&G to haze wildlife. This activity requires that an applicant contact ADF&G directly to obtain a hazing permit.

For the most current version of the following ADF&G permits, please Reference the website provided.

Mammal, Bird & Reptile Permits

**4880 – Dredging - TBD****4890 – Decanting**

Reference [Section 4850](#) for permitting instructions.

**4900 – RESERVED FOR AREA/DISTRICT**

### 5100 – LOGISTICS SECTION ORGANIZATION

The following are helpful resources for establishing a case specific logistics section organization:

- [The USCG Incident Management Handbook](#)
- [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response.](#)

Note: None of these are specifically prescribed by this plan, and none are mandated for use by response plan holders or potential responsible parties. Federal and State On-Scene Coordinators will work with the response organization established by the responsible party in responding to and managing oil or hazardous substance releases as long as their organization is compatible with ICS principles

### 5200 – SUPPORT

Alaska is the largest state, with isolated communities and villages, extreme weather, vast uninhabited areas, and limited transportation options. The majority of communities in the State are accessible only by air or water and have limited accommodations to house and support a large influx of response personnel. Accordingly, self-contained support facilities for equipment and personnel will be required for a sustained response in the remote regions. Due mainly to these extreme logistic requirements, it can be far costlier to mount a response in Alaska.

#### **5210 – Supply**

##### **5210.1 – Federal**

###### *5210.1.1 - EPA*

The **U.S. Environmental Protection Agency** incident response equipment is based out of the EPA Emergency Response Warehouse in Anchorage, AK. Additional equipment in Region 10 is also located in Seattle, Washington and Portland, Oregon. Equipment maintained at the Anchorage Emergency Response Warehouse consists of the following:

- Monitoring equipment for multiple hazardous materials and chemicals;
- Sampling equipment;
- Level A & B response gear and PPE;
- Personnel Decontamination equipment;
- Minor containment and clean-up equipment;
- Mobile command post trailer with satellite communication capability, including a T-1 internet connection;
- Response trucks; two equipment trailers, and an all-terrain vehicle with equipment bed; and
- Gasoline and diesel generators for remote power.

###### *5210.1.2 - USCG*

The **USCG** maintains twenty pre-positioned oil pollution response equipment depots in Alaska. Locations of these depots are Ketchikan, Sitka, Juneau, Petersburg, Valdez, Cordova, Anchorage, Kenai, Seward, Homer, Kodiak, Attu, King Cove, Whittier, Port Graham, St George, St Paul and Dutch Harbor. Except for Anchorage, the basic equipment package consists of harbor boom (mainly Kepner Sea Curtain), anchor/towing support, various sorbents, generators, emergency lights, and limited personnel protection equipment (Reference map provided in this annex). In Anchorage, one vessel of opportunity skimming system (VOSS) and 5,000 ft. of offshore boom (seas to 4 ft.) are pre-positioned on four flatbed trailers for

quick transport to the scene. The equipment is located at Fort Richardson. A response trailer with sorbent materials is maintained at Seward. Contact the FOSC or the Supervisor of the District Response Team (DRAT) for access to the pre-positioned equipment. For additional details regarding USCG District 17 DRAT resources, visit the following website: <http://www.uscg.mil/d17/d17response/drat/dratpage.asp>

At Ft. Richardson, the USCG VOSS and 5,000 feet of ocean boom are located in Building 800. The equipment is staged on flatbed trailers for quick response. This building is also the main warehouse for response equipment maintained by the Navy Supervisor of Salvage (NAVSUPSALV) ESSM Base Anchorage. In the event of an oil spill, this equipment is available for mobilization at the request of the FOSC. Under most circumstances, mobilization support will be coordinated by NAVSUPSALV ESSM Base Anchorage personnel. In the event that NAVSUPSALV cannot assist, an Interagency Support Agreement (ISA) is in place between the US Army and the USCG. The ISA provides authority for the US Army to arrange for immediate transportation requirements, and provides funding reimbursement, normally through the Oil Spill Liability Trust Fund by means of a Federal Pollution Number for a particular event.

#### **Oil Spill Response Equipment Notification/Mobilization:**

***During normal duty hours, notification of personnel and mobilization of equipment will be as follows:*** FOSC authorizes mobilization of USCG equipment. FOSC representative or USCG D17 (DRAT) will coordinate with NAVSUPSALV (907 384-2968) to prepare the loads for transport, and arrange for commercial transport to the site or the load-out area. A Pollution Fund Authorization form will be required for NAVSUPSALV support.

In the event NAVSUPSALV is unavailable, USCG will notify DOD (ALCOM) and the Ft Richardson Command Operations Center (COC) of an oil spill, specify the support required, and pass along the name and telephone number of the USCG point of contact. The Ft Richardson COC has procedures in place to alert the Director of Logistics, Plans and Operations Division (907 384-2212), and to arrange for 24-hour vehicular support (907 384-6666).

**During Other-Than Normal Duty Hours:** The USCG will notify the 24- hour NAVSUPSALV duty officer (907 229-8859) and request support. If NAVSUPSALV is unavailable, USCG will notify ALCOM and request assistance to mobilize the VOSS and other pre-staged response equipment from Bldg. 800, Ft. Richardson. ALCOM will coordinate with the Ft. Richardson Command Operations Center to provide necessary support.

Designated individuals within the framework of this agreement will be given emergency contact procedures to use in contacting the USCG personnel involved in this process. Upon notification that emergency support is requested, NAVSUPSALV or US Army personnel should contact the USCG to determine the equipment destinations and specific time schedules.

Questions concerning these procedures or the USCG's emergency response equipment should be directed to USCG D17 (DRAT) at (907) 463-2807/2806/2804.

The USCG operates vessels and aircraft that may be available for use in pollution response. The type and location of these assets are as follows:

**Air Station Kodiak:**

1. Five HH-C-130H Hercules fixed wing aircraft. A long-range workhorse with 14 hours endurance and cruise speed of 290 knots. Cargo space is limited to 2,870 cubic feet with no passengers. Cargo space dimensions are 10 ft. (width) x 26 ft. (length) or 41 feet from ramp with Search and Rescue (SAR) bin removed x 9 ft. (height). Size of loading hatch is 7'-6" high x 9'-11" wide. Under normal operation conditions with a standard fuel load, the maximum allowable loading including passengers is 50,000 lbs.
2. Four HH-60J Jayhawk helicopters. A medium range recovery helicopter with 6 hours endurance and cruise speed of 135 knots. The cargo space is approximately 300 cubic feet. Under normal operating conditions with a standard fuel load, the maximum allowable loading, including passengers is about 2000 lbs. This aircraft is equipped with a hoist having a 600 lb. capacity and an external sling whose capacity is rated at 6,000 lbs.; however, the total weight of fuel and other cargo may limit the lifting capacity of the helicopter.
3. Four HH-65A Dolphin helicopters. A short-range recovery helicopter with 3.5 hours endurance and 125-knot cruise speed.
4. USCG Aviation Support Facility Cordova (AVSUPFAC Cordova). This facility may be reached at (907) 424-7346.

**Air Station Sitka:** Three HH60J Jayhawk helicopters. A medium range recovery helicopter with 6 hours duration and 135-knot cruise speed.

**Seagoing Buoy Tenders (WLB/WLM):** WLBs are 225 ft. in length, with a maximum speed of 15 knots, and a maximum range of 6000 nautical miles. WLM is 175 ft. in length with a maximum speed of 13 knots. Four WLBs and one WLM are home ported in Alaska.

1. CGC SPAR (WLB 206): Kodiak, Alaska
2. CGC HICKORY (WLB 212): Homer, Alaska
3. CGC SYCAMORE (WLB 209): Cordova, Alaska
4. CGC MAPLE (WLB 207): Sitka, Alaska
5. CGC ATHONY PETIT (WLM 558): Ketchikan, Alaska

In addition, all four of the WLB's carry two SORS (Spilled Oil Recovery System) on board. Each system consists of an outrigger assembly, a fast sweep boom, a Desmi Terminator Weir Skimmer, a control stand, and two Canflex Sea Slug floating storage bladders (12,500 gal capacity and 26,400 gal capacity).

**High Endurance Cutters (WHEC):** WHECs are 378 feet in length, with a maximum speed of 29.0 knots and a maximum range of 14,000 miles. Although no WHECs are home ported in Alaska, a WHEC is usually on patrol in Alaskan waters.

**Medium Endurance Cutters (WMEC):** WMECs are 213 to 283 feet in length. The CGC ALEX HALEY is the largest WMEC in the USCG fleet. Their maximum speed ranges from 14 to 19.5 knots and maximum range can approach 22,000 miles. The Register of Cutters of USCG contains vessel specific information on an individual cutter's performance. Two WMECs are home ported in Alaska:

1. CGC MUNRO(WHEC 724): Kodiak, Alaska
2. CGC ALEX HALEY (WMEC 39): Kodiak, Alaska

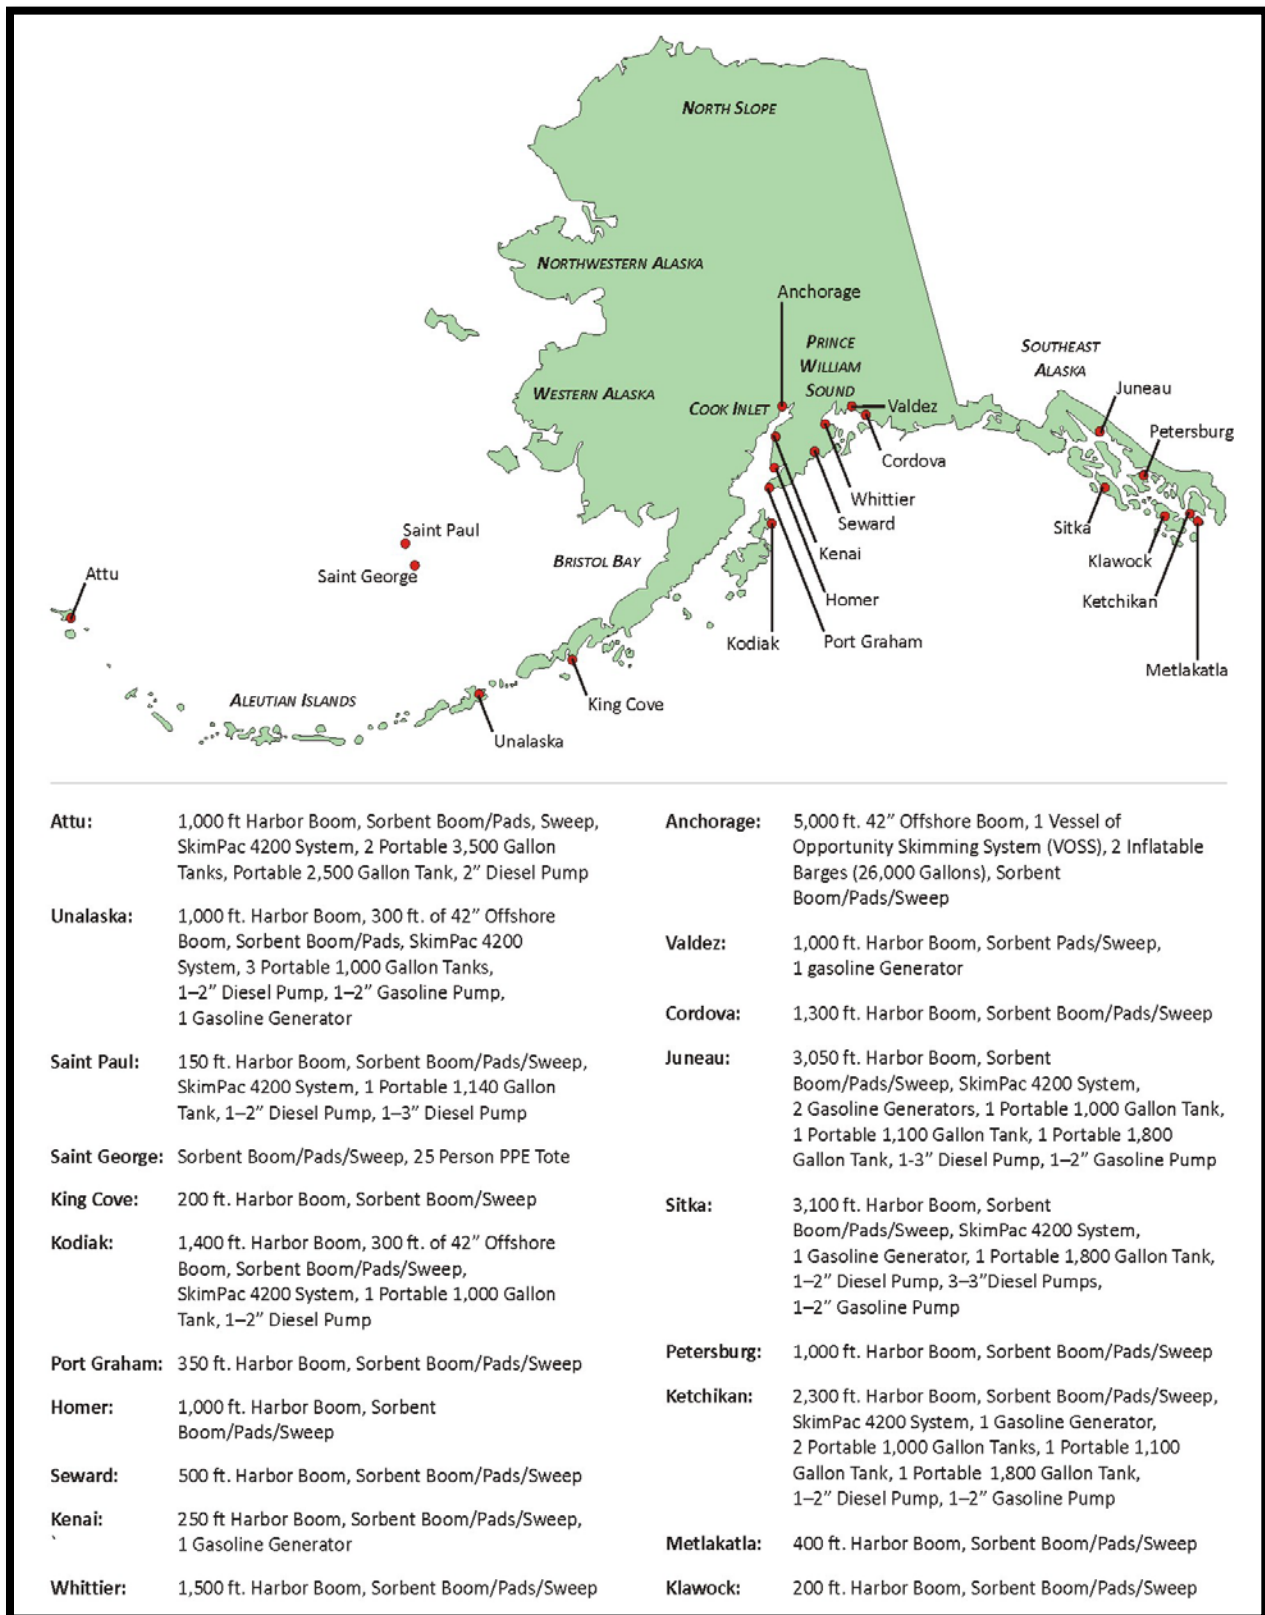

**Patrol Boats (WPB)/Patrol Cutter (WPC):** WPBs are 110 feet in length with a maximum speed of 30 knots, and a maximum range of 1,800 miles. Five WPBs are home ported in the following locations. One WPC

(154 feet in length, max speed of 28 knots, and a max range of 2,500 nautical miles) is homeported in Ketchikan Alaska:

1. CGC MUSTANG (WPB 1310): Seward, Alaska
2. CGC LIBERTY (WPB 1334): Juneau, Alaska
3. CGC ANACAPA (WPB 1335): Petersburg, Alaska
4. CGC NASHON (WPB 1311): Homer, Alaska
5. CGC CHANDELEUR (WPB 1319): Valdez, Alaska
6. USCGC JOHN MCCORMICK (WPC-1121): Ketchikan Alaska

**Inland Buoy Tenders (WLI):** The only WLI in Alaska, CGC ELDERBERRY, is home ported in Petersburg. It is 65 ft. in length, has a maximum speed of 10 knots, and a maximum range of 2,000 miles.

**Figure 5-1: USCG D17 District Response Advisory Team Per-Positioned Equipment Location**

#### 5210.1.3 - DOD

The **Department of Defense (DOD)** has various military facilities, vehicles, equipment, and in some cases aircraft which can be made available in the event of critical incidents. In addition, construction related equipment might be locally available. Requests for DOD support shall be made through the RRT.

All request for DOD assets shall be made through the FOSC. The FOSC will forward the request to the USCG D17 Command Center, who will liaison with ALCOM. Funding for all DOD assets will be provided through the OSLTF. If DOD assets are employed in a response, representatives from DOD shall be included in the incident command structure. Actual availability of equipment will depend on contractual arrangements and agreements between the party owning the equipment and the party desiring to purchase or use the equipment. No prior permission or arrangement for the use of this equipment is implied or granted by the inclusion of any organization's equipment, whether federal, state, local, or privately owned.

#### 5210.1.4 – NAVY SUPSALV

The **U.S. Navy, Supervisor of Salvage (NAVSUPSALV)** is the Federal agency most knowledgeable and experienced in ship salvage, shipboard damage control and diving. They also have extensive knowledge in oil spill response. They have equipment depots in Williamsburg, Virginia, Port Hueneme, California, Anchorage, Alaska, and Pearl Harbor, Hawaii. These depots have an extensive array of specialized equipment and personnel for use in oil spill response and ship salvage operations. Equipment is available to FOSC's, with operators and maintenance support, on a cost reimbursable basis. Requests for NAVSUPSALV support shall be made through the RRT. Contact (907) 384-2968 (Anchorage) or (703) 602-7527 (24-hour) for current inventories and equipment availability. Early alert "heads-up" calls are encouraged, appreciated, and invaluable even if the extent of the response has not been determined.

#### 5210.2 – State

Although emergency spill response equipment depots have not been established as required by law, the Alaska Department of Environmental Conservation (ADEC) has established nearshore response packages and pre-positioned spill response equipment caches as directed by the State legislature.

##### 5210.2.1 – Term Contractors

ADEC maintains Term Contracts for emergency response to both oil and hazardous material spills. These contracts can be activated by the issuance of a *Notice to Proceed* by the Contract Manager or State On-Scene Coordinator.

#### 5210.2.2 – Community Spill Response Agreements

ADEC has entered into formal [community spill response agreements](#) with several local communities for the purposes of oil and/or hazardous materials response. ADEC will reimburse the community for costs incurred in responding to the spill and any containment and recovery actions involved. These local response agreements are intended to maximize the use of existing local resources, provide proper reimbursement, and, where appropriate, provide training in the use of response equipment. Also, Reference the ADEC Call-out Directory (current edition) for the contact persons and telephone numbers for activating these response agreements.

#### 5210.2.3 – State Ferries

An important response asset is the State “response” ferry, which provides an expanded communications capability as well as an excellent platform to manage a significant spill response. Other State ferries may also be called upon in a major spill response to provide berthing and forward staging platforms for work crews. Other State vessels may be available from the Alaska Department of Fish and Game and the Alaska Department of Public Safety. Reference the Alaska Marine Highway System [Vessel Information Table](#) for further details.

#### 5210.2.4 – Emergency Towing System (ETS)

Reference [Section 8200](#) of this document for information on the Alaska Emergency Towing System.

#### 5210.2.5 – Spill Response Containers

ADEC, as the State of Alaska’s lead agency for responses to oil and hazardous substance spills, has developed a network of response equipment packages positioned in at-risk areas throughout the state. Many Alaskan communities are isolated from the larger population centers and the spill response equipment that is likely to be available there. To enhance the State’s response capability and to assist these remote communities, ADEC has pre-staged across the state packages of spill response materials and equipment stored in steel containers of the “conex” type, which are air transportable. These local equipment response packages provide an immediate on-site response capability that can be accessed by trained personnel in a timely manner. Most of the packages are designed to assist in the initial response and cleanup of non-persistent oil spills in harbor areas. A map of response container locations and inventory information is available at the following link: <http://dec.alaska.gov/spar/ppr/response-resources/local-response/>

### 5210.2.6 – Alaska Department of Fish and Game (ADF&G) Vessels

The following information is provided for ADF&G vessels that may be available to support an oil spill response operation. Two other vessels, the R/V Kittiwake and the R/V Solstice are also part of the ADF&G vessel inventory. These are ADF&G research vessels and may be out at sea on research missions most of the time, so their availability for spill response is limited.

### 5210.3 – Industry

Five industry response cooperatives currently exist in the State to provide oil spill response capability for certain facilities located together in a specific region. Alaska Clean Seas serves the North Slope region; Cook Inlet Spill Prevention and Response Inc. (CISPRI) serves the Cook Inlet region; and Alaska Chadux Corp serves the non-crude industry.

#### 5210.3.4 – Kodiak

Within Kodiak, there are several businesses that maintain spill response equipment, and some of this equipment may be available to purchase or lease during a spill response. Because equipment inventories vary, it is not feasible to list exact quantities of this equipment.

The following lists includes contact information for facilities and vendors that may be able to provide response equipment.

| Facility/Vendor                          | Phone         | Equipment                                                                                                                   |
|------------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------|

BPXA, ConocoPhillips Alaska and other companies operating in the North Slope oilfields have a substantial amount of storage facilities and other equipment as identified in their respective contingency plans. In the event of a spill in these areas, the industry spill response cooperative, Alaska Clean Seas, would provide much of the required response equipment, but industry equipment may be available, particularly when the company is the responsible party (RP).

Alaska Clean Seas Inventory: **Alaska Clean Seas (ACS)** is a non-profit spill response cooperative, with membership companies involved in oil and gas exploration, development, production or pipeline transport activities on the North Slope.

The purpose of ACS is to provide member companies with the trained personnel and equipment in the event of an oil spill or chemical release. ACS must prepare for, respond to and clean up an oil spill resulting from North Slope oil production operations conducted by their industry members. The response area includes the oilfields and the Trans Alaska Pipeline (TAPS) from Pump Station 1 in Prudhoe Bay to Pump Station 4 in the Brooks Range north of Atigun Pass. ACS may also respond to non-member spills with authorization by the ASC Board of Directors.

Alaska Clean Seas equipment is listed on the ACS website ([www.alaskacleanseas.org](http://www.alaskacleanseas.org)). For specific questions regarding their spill response equipment assets, contact the ACS Resource Specialist at 659-3212.

Within the Northwest Arctic Geographic Zone, few businesses maintain spill response equipment for purchase or lease during a spill response. The Anchorage-based spill cooperative **Alaska Chadux Corporation (ACC)** maintains equipment to be used in responses in the region. Their inventory includes containment boom, sorbents, skimmers, pumps & hoses, skiffs, anchors, storage bladders, and personal safety equipment. Contact ACC at (907) 348-2365 for details; an updated list of equipment stored in Nome and Kotzebue can be found on their website: <http://www.chadux.com/nome.html> and <https://www.chadux.com/equipment/kotzebue-hub>

There is a limited amount of industry equipment in the Western Alaska Geographic Zone. Vessels and facilities operating in the Geographic Zone are required to have a minimum amount of equipment to comply with the contingency or response plans required for their operation by the State or Federal government. However, in the event of a large spill, additional equipment from outside the Geographic Zone will be necessary.

In the event of a spill in these areas, the industry spill response cooperative, Alaska Chadux Corporation, would provide much of the required response equipment, but industry equipment may be available, particularly when the company is the responsible party (RP). However, not all facilities have arrangements with Alaska Chadux for response support.

Alaska Chadux Corporation (ACC)

## **5220 – Facilities**

### **5220.1 – Incident Command Post (ICP) Options**

#### *5220.1.1 – Location*

Regardless of the spill volume, the FOSC and SOSC will initially operate from their normal offices. Likewise, the resource agency representatives will likely do the same, although they may join one of the OSCs at their offices if space is adequate. For significant spills, these offices may prove inadequate and a joint command center will be required. Spills extending over a large area may require the establishment of forward command post as well. Potential outlying command posts and staging areas are listed, when provided, by community under the [Community Profiles](#). In general, a command post would likely be established in the closest community that has the services and support facilities to maintain a command center.

For a response by CISPRI to a member company's spill, expect to use the CISPRI command center facility in Nikiski as a central location. Spills extending over a large area may require the establishment of auxiliary locations. Incident Commanders may consider the Denaina or Egan convention centers or one of the large hotels in Anchorage with expandable meeting/banquet rooms that offer the space and utilities required

for a command post. The State Emergency Coordination Center at JBER (Camp Denali) or the Municipality of Anchorage Emergency Operations Center could also be activated for a major response operation.

For the Kodiak Geographic Zone, a command post would likely be established somewhere in the City of Kodiak, since this is the one location in the region that could meet the command post and staging area requirements of a large response operation. The Kodiak Island Borough School District Superintendent serves as the primary contact for coordinating the use of local schools in the Kodiak Island Borough.. The KIB Assembly Chambers is currently the designated EOC for borough-wide emergency responses, with the Alaska Army National Guard Armory the designated backup facility, but a new dedicated-EOC will be housed in the new police station, which is under construction on Mill Bay Road.

For a response to a major oil spill in the Prudhoe Bay area, the responsible party will normally establish a command post at existing facilities, and a Unified Command will be formed consisting of Federal, State, Local On-Scene Coordinators and the Responsible Party. For offshore incidents, land-based incident command posts (supported by on-water field command posts) will likely be activated.

The Mayor of the Borough will serve as the primary contact for coordinating the use of local schools in the North Slope Borough. The NSB School District (852-5311) should also be contacted on the use of a school as a potential command post. In most cases, all items for support (food, berthing, communication, etc.) at the field command centers will have to be provided from outside the community

The Mayor of the Northwest Arctic Borough (442-2500) will serve as the primary contact for coordinating the use of local schools in the borough, and the NWAB School District (442-3472) should be contacted on the use of a school as a potential command post. For locations in the Northwest Arctic Geographic Zone outside of the borough, contact the town/village government offices or school directly.

#### **WESTERN ALASKA - POTENTIAL COMMAND POST LOCATIONS**

| COMMUNITY     | POTENTIAL CP LOCATION                 | *CONTACT/PHONE    |

| Upper Kalskag                  | Airport, School                       |                   |

\*Consult/coordinate with airport manager prior to establishing a command post at the airport facility. For use of the school, contact the school district.

#### *5220.1.2 – Procedures for Establishment*

For a federally funded response, the General Services Administration (GSA) and the Seventeenth USCG District will locate and contract for the command center. For Responsible Party (RP) responses, the spiller/responder will be required to provide an adequate command center.

### 5220.1.3 – Equipment

The amount of equipment to outfit the command post will be determined by the size of the response. In general, the following will be required equipment for every command post (any items not already available will be rented or purchased locally):

- Telephones and phone books
- Appropriate number of copiers and computer printers, including large format printers or plotters.
- Desktop and portable computers with printers and fax/modem capability
- Internet and email access
- Office furniture
- Portable radios and marine communications base station
- Cameras and Video recording/playback capability
- Office supplies (pens, pencils, paper, flash drives, blank CDs and DVDs, etc.)
- Chart paper with easels and status boards (dry-write)
- Overhead and computer projectors
- Applicable maps and GIS data, including Environmental Sensitivity Index (ESI) maps and Most Environmentally Sensitive Area (MESA) maps
- Copies of any applicable industry contingency plans
- Copies of any appropriate local emergency response plans
- Copies of the Area Contingency Plan
- Copies of the Alaska Incident Management System (AIMS) Guide
- Copies of the USCG Incident Management Handbook (COMDTPUB P3120.17)
- Copies of the Spill Tactics for Alaska Responders (STAR) Field Guide

### 5220.2 – Berthing

A number of commercial lodging facilities are available across the Arctic and Western Alaska. However, during the summer tourist season, most lodging facilities are booked at capacity and availability will be limited. The smaller communities have very limited lodging facilities or no facilities at all. Some possible alternatives to traditional lodging may be the use of RVs, mobile homes, portable work camps/shelters, National Guard Armories, school gyms, etc. However, in some of these cases, if the incident is no longer deemed an emergency, specific zoning rules may prohibit use. On-water berthing facilities for response personnel may be required. Chartered passenger vessels, constructed “hotel” barges, or US Navy vessels might be utilized to provide berthing. All “berthing” type vessels must meet current USCG licensing requirements. Reference the [Community Profiles](#) for additional information.

### 5220.3– Port/Dock Facilities/Capacities

#### 5220.4 – Staging Areas

Staging areas for spill response are those locations where equipment from all sources is assembled and held pending deployment to the spill site. Ideally, staging areas should be large enough for interim storage of all equipment, and in close proximity to the spill site to minimize transit time for equipment to the scene. During prolonged spill control operations, equipment maintenance may be accomplished in the staging areas, and staging areas may likely have to be away from the water.

Reference the [Community Profiles](#) for community specific staging area options, as available.

Portable restrooms (port-a-potties) for remote or extended operations must be provided since most locations within the Arctic and Western Alaska are undeveloped. Portable toilets may be located on-site for use by crews working on the response. Portable restrooms in remote communities may have to be brought in from Fairbanks or Anchorage. While in service, the units would need to be offloaded into a pump truck mounted on a barge, pumped into a sewage barge, or airlifted by helicopter to a receiving site. USCG approved marine sanitation devices aboard vessels or designated sewage barges are other options that may be used in remote sites. Land-based outhouses will need state and resource trustee approval. Approval from the property owner will be required if staged on private property.

#### 5220.5 – Security Providers

Reference the [Community Profiles](#) for community specific law enforcement details, as available.

#### 5220.6 – Airports/Heliports

Since airport information is updated on a frequent basis, rather than list the airports and specific information on each airport, the following website is provided for specific information regarding airports that may be used to support an oil or hazardous substance spill response:

[http://www.dot.state.ak.us/stwdav/airports\\_public\\_central.shtml](http://www.dot.state.ak.us/stwdav/airports_public_central.shtml)

##### 5220.6.1 – Aleutians

#### **5220.7 – Temporary Storage and Disposal Facilities (TSDs)**

Reference the [Community Profiles](#) for community specific storage/disposal details, as available.

An ADEC solid waste permit is required. Consult with ADEC on the landfill status and the current information on the adequacy of landfills. Currently, no approved hazardous waste disposal sites exist in Alaska. Municipal landfills in Alaska either no longer accept oily wastes or accept only lightly oiled soils.

#### **5220.8 – Maintenance and Fueling Facilities (land/water)**

Fueling Facilities: Fueling facilities for land, marine and air equipment will be limited in remote regions. For an extended response, remote fueling sites will need to be established to assure maximum operating and flight time on scene. Land based fueling sites will require approval from State and resource trustees and will need to provide provisions for spill prevention.

Maintenance Facilities: Maintenance facilities will need to be provided by the equipment owner/operators. In general, self-contained maintenance facilities are required in all areas outside the major population centers.

Reference the [Community Profiles](#) for community specific maintenance and fueling facility details, as available.

#### **5220.9 – Fish and Wildlife Response Facilities and Resources**

Guidance for determining how to deal with oiled or potentially oiled wildlife is found in the Wildlife Protection Guidelines for Alaska: <http://dec.alaska.gov/spar/PPR/plans/uc.htm>

For example, the Guidelines include contact information for wildlife resource agencies by wildlife species (Appendix 26); information on factors that need to be considered when determining when to begin and end a wildlife capture and treatment program (Appendix 1); permits and/or authorization required for wildlife response activities (Appendix 16); entities in Alaska with equipment and materials stockpiled for wildlife response activities (Appendix 21); and checklists for requesting authorization to conduct wildlife deterrence and/or wildlife capture, stabilization, transportation, and treatment (Appendices 24 and 25).

### **5230 – Vessel Support**

#### **5230.1 – Boat Ramps/Launching Areas**

Boat ramps are typically found in developed communities within each geographic zone. If available, harbor masters can provide port information. Reference [the Community Profiles](#) regarding the vessel

support capabilities at a specific community or contact the village coordinator for specific information and capabilities.

#### **5230.2 – Vessel/Boat Sources**

A partial listing of towing companies within the state is provided below. The homeports of vessels are provided, but at any time vessels may be on contract at distant locations. Due to the relatively low number of in-region tug operators, it may be necessary to mobilize vessels from outside the Geographic zone. The USCG at Sector Anchorage (428-4200) can provide additional information regarding companies capable of providing marine-towing resources.

5230.2.1 – Aleutians

### 5230.3 – Maintenance

Scattered maintenance and repair facilities exist across the Arctic and Western Alaska planning area. Extended operations not in the immediate vicinity of maintenance facilities will require that self-contained facilities be brought on scene. Limited maintenance facilities may be available locally. The responsible party will need to provide self-contained facilities aboard barges or other means.

For community specific information, reference [the Community Profiles](#).

### 5240 – Ground Support

The Alaska Railroad provides rail service to Anchorage, Fairbanks, Seward, and Whittier. Additionally, private truck companies and rental car/truck agencies are available for transporting response personnel and equipment.

#### 5240.1 – Vehicle Sources

Reference the local Phone Book/Yellow Pages for up-to-date listings of companies that commercially rent or lease trucks and automobiles. Also, reference [Community Profiles](#) for additional information that may be available for a specific town or village, including the possibility of local heavy equipment availability. The Alaska National Guard and the Alaska Department of Transportation and Public Facilities also may be able to provide resources.

##### 5240.1.1 - Aleutians

Note: No road connects the Northwest Arctic geographic zone with the rest of the state, and only a few towns or villages are connected to each other by any roads. Overland travel is more common in the winter when frozen trails allow the use of snow machines, dog sleds and four-wheelers. *No commercially available pump trucks known in region.*

#### 5240.1.7 – Western Alaska

Very few communities in this geographic zone are connected to other villages via year-round roads, although many seasonal roads or trails connect communities. None of the communities are accessible by road system and ground transportation and vehicle rental opportunities are limited. Several communities offer auto rentals and off-road vehicle rentals. In no vehicle rental business are listed in the community profiles, arrangements to rent a vehicle, snow machine or ATV may be available or facilitated by the city office, tribal office or village corporation.

| AUTOMOBILE RENTING/LEASING |          |           |
|----------------------------|----------|-----------|
| Company                    | Location | Telephone |
| Bethel Car Rental          | Bethel   | 543-3058  |

#### 5240.2 – Maintenance

Scattered maintenance and repair facilities exist across the Arctic and Western Alaska planning area. Extended operations not in the immediate vicinity of maintenance facilities will require that self-contained facilities be brought on scene. Limited maintenance facilities may be available locally. The responsible party will need to provide self-contained facilities aboard barges or other means.

For community specific information, reference the [Community Profiles](#).

### 5300 – SERVICES

#### **5310 – Food**

A major response will require significant quantities of food and the associated equipment necessary for properly handling, storing, preparing and disposal. These tasks would require contract support from the local area as long as the requirements did not exceed local capability. Anchorage has numerous construction support organizations that could provide portable field kitchens and catering support complete with portable shelters; this support can be provided in air-transportable "packages." It is recommended that food and other basic supplies be purchased from stores immediate to the incident, when possible. Larger responses will require purchases from vendors outside the area. High-speed vessel transport or small aircraft may be needed deliver food to on-scene personnel.

### **5320 – Medical**

All medical resource information can be found in [Section 3350](#) of this document, or in [the Community Profiles](#).

### **5330 – Clothing**

Alaska's environmental conditions dictate that response personnel be equipped to operate in the harsh arctic environment. Personnel must arrive on-scene with adequate clothing to begin working immediately. This includes a complete set of heavy-duty rain gear, steel-toed rubber boots, gloves, hard-hat liner, and warm (preferably no cotton) under garments. Depending on the season, winter outerwear will also be required. Employers will be responsible for resupplying their employees with necessary clothing.

### **5340 – Training and Safety Equipment**

All responders must report with the minimum required OSHA and State hazardous response training and all required personal protective equipment (PPE). This equipment includes hardhat, safety goggles, hearing protection, gloves, personal flotation device, respirator with cartridges, steel-toed boots. It will be the responsibility of the employer to provide and document the required training and to fully outfit and resupply their personnel with the necessary safety equipment. Availability of PPE will be confirmed by the Site Safety Officer.

All of Alaska is "bear country." Crews working in remote locations should be trained in how to be safe in brown bear habitat. Workers may need to be provided bear spray or have designated well-trained guards with the appropriate guns as a precaution against negative man/bear encounters. These remote crews may also require one or more of the following: briefings on how to handle food residue and trash; bear resistant containers for food and perishable items; and portable electric fencing for camp security to deter bear investigations.

## **5400 – COMMUNICATIONS**

### **5410 – Communications Plan**

#### **5410.1 – Incident Communications**

The following recommendations apply to response scenarios that are likely to occur and communications strategies for use during those type incidents.

#### ***Situation 1: Ability to receive initial report of grounding, collision, spill, etc.***

This is essentially the same basic information requirements for Search and Rescue (SAR) missions. Primary communications strategy would initially be by VHF marine radio and on telephone as the primary means of passing the initial report. Secondary communications would employ cell phone/SAT phone or HF radio depending upon the capabilities available in the surrounding area. Under normal circumstances, a call would be made to the USCG Communications Center, which would, in turn, pass the information to responsible Command Center personnel for further prosecution.

#### ***Situation 2: Voice communications with on-scene USCG investigation personnel.***

The investigator typically will not have a cutter on scene and may arrive via charter aircraft or vessel. The investigator must be able to pass and receive information in a timely manner (2-6 hours after the initial report) to the cognizant Sector Command Center. The investigator may not be able to use the assets of the damaged vessel due to safety or location issues.

Primary communications strategy would be by VHF marine radio either directly to the USCG Communications Center or cell phone to the Sector Command Center. If telephone service is available in the general area, subsequent reports will use that means. Secondary communications strategy would be via HF, VHF-FM, and/or telephone.

**Situation 3:** Command and control for a small number of on-scene units.

In a small response, there typically will be one USCG cutter, one helicopter, and two vessels from other organizations. They will need to talk to each other as well as to Sector personnel. The designated Federal On-Scene Coordinator (FOSC) will assign frequencies to all assisting units. The FOSC will be assigned by the Sector Command Center.

Primary communications strategy will be VHF-FM for close-in operations. HF communications guard with aircraft will be maintained by Communications Station (CommSta) Kodiak. Air-to-surface communications will be a combination of VHF-FM/HF or VHF, depending upon the surface vessel capabilities.

**Situation 4:** Command and control for large number of on-scene units (estimated occurrence is once every 5-10 years).

During an incident near the scale of the Exxon Valdez, communications requirements (voice and data) with numerous units (air and surface) from multiple organizations should be anticipated.

Primary Communications Strategy – VHF-FM and/or HF.

Secondary Communications Strategy – HF and/or VHF-FM, and UHF depending on unit capabilities and civilian capabilities. Normally the on-scene coordinator will have capabilities meeting both USCG/DHS and civilian sector capabilities. If not, a transportable telecommunications center can be airlifted in to provide the capability. This asset is situated in Sacramento, CA. and requires FORCECOM coordination to mobilize for air shipment. It also requires radio operators from the requesting district.

#### **5410.2 – Emergency Communications**

Three separate systems for broadcast of emergency messages are available to the Alaska Regional Response Team (RRT) and the Federal or State On-Scene Coordinator. These include the NOAA Weather Radio System, the State of Alaska Emergency Alert System, and the National Warning System.

**NOAA Weather Radio System:** The Alaskan NOAA Weather Radio System is handled through the National Weather Service (NWS) and is constantly updated. The NOAA Weather Radio System operates in two modes, i.e. normal and alarm. In the normal mode, the system provides regionally specific updated weather information. In an emergency, NWS can activate the alarm mode. In the alarm mode, NWS can remotely activate any one of 15 remote radio weather transmitters. The OSC or the RRT can activate the alarm mode of the Alaskan NOAA Weather Radio System by contacting the NWS and stating that they wish to activate the NOAA Weather Radio System to service certain geographical areas. All messages should be short and concise. As a minimum, provide the following information:

- The nature of the emergency
- Actions underway by local, State and federal agencies and the Responsible Party
- Special instructions to the public

Standard NOAA weather radio transmitters (with a nominal 45-mile broadcast radius) are situated at strategic locations throughout the state. In addition, when NOAA makes a broadcast on its weather radio affecting a specific geographical region, it can also notify the local primary Common Program Control

Station (CPCS-1), a component of the Emergency Alert System, covering the affected area and ask the CPCS-1 station to rebroadcast the emergency message.

**State of Alaska Emergency Broadcasting System:** The Alaska Division of Homeland Security and Emergency Management (ADHSEM) is responsible for activation of the State Emergency Alert System (EAS). The State EAS can be activated statewide or regionally. To use the EAS, contact ADHSEM and request system activation.

**National Warning System:** The ADHSEM also operates the Alaska component of the National Warning System (NAWAS). The NAWAS alerting system is designed to provide immediate notification to 28 communities and agencies located in Alaska. This system uses dedicated commercially leased landlines. To use this alerting system, contact ADHSEM and request activation of the NAWAS.

To activate either the EAS or the NAWAS contact ADHSEM at **1-800-478-2337 or 907-428-7000** and provide information as noted above in paragraph a: NOAA Weather Radio System.

## **5420 – Communications Capabilities**

### **5420.1 – General**

Adequate communications equipment along with a well thought out communications plan are imperative to a coordinated response. For responses involving numerous vessels or operations distant from the command center, the communications center will have to be placed as close to the response location as feasible. The communication center will require telephones, facsimile machines, single side band, and VHF-FM base station with additional portable radios. The distances involved may necessitate the installation of VHF repeater stations to allow communications at greater distances. Contingency planners must seriously address their communications requirements prior to a spill. Failure to properly command and control response resources will prove devastating to the response.

Good, dependable communications between the command center and field operations is essential for an efficient spill response. For minor, short duration responses, a minimum of direct point to point communications will be needed and can normally be provided with two or more VHF marine portable radios or, possibly, with telephones. For large, extended responses covering a wide area, a communications set up as close to the incident as possible will be necessary. The communications center will require telephones, facsimile machines, and a single sideband/VHF-FM base station along with additional portable radios. Satellite communications may be added as required.

During prolonged spills, VHF repeaters, multi-frequency scanners, and continuous tape recorders may need to be installed. Portable repeaters can increase the communication range several fold depending upon where the repeaters are placed, by supplementing the coverage provided by permanently installed repeaters.

All responses will require either a simple communication schedule identifying when reports are to be transmitted and when field crews are to report, or a full-scale communications management plan that includes the assignment of frequencies, channels, and call signs for various operations.

**Radios:** Marine communications at the command center and aboard vessels will generally require 25-watt VHF marine radios with high gain antennas. Vessels usually monitor channel 16 and switch to other working frequencies. When aircraft are used in conjunction with on-water activities such as directing vessel movements, VHF marine frequency radios will be required for use by the aircraft. Due to aircraft

noise, these radios should be equipped with headsets and boom mikes. Communications with aircraft from the command center will require standard VHF frequency capability. ALASCOM's Marine Radio Service provides vessel-to-vessel, vessel to shore, and shore to vessel communications through the marine VHF single side band service. In large spills where the responsible party is unknown or is not responsive, the contracted response organization will be required to provide the necessary communications "package".

VHF radio communications is the primary radio band used by the State of Alaska, EPA and USCG. However, many local emergency responders utilize the UHF band. During a Unified Command response, and in areas without ALMR coverage and ALMR compatible radios, multiple agency/ government radios may need to be utilized and monitored due to the range of frequencies used by the various parties.

ADEC Communications equipment is maintained by the logistics staff, which can be reached at 465-5234 in Juneau or 344-7380 in Anchorage. Communications support is provided by the Department of Administration ETS branch at 296-5781 in Anchorage.

Response on water will generally utilize the VHF marine radio frequencies. The USCG primarily operates on these frequencies. Due to aircraft noise, these radios should be equipped with headsets and boom mikes. Communications with aircraft from the command post will require standard VHF frequency capability

In large spills where the responsible party is unknown or is not responsive, the contracted response organization will be required to provide the necessary communications "package." The State of Alaska has a mobile emergency communications system (available through the Department of Military and Veterans Affairs) that can be deployed during an emergency declared by the governor. In the initial stages of a response, this system might be available to the Unified Command but only until a separate communications system can be established. The state's system is intended for use by state agencies in emergencies and not as a joint-use system for other response agencies/organizations. DMVA (through the Alaska National Guard) also maintains an Emergency Communications Response Team that can be mobilized to provide forward communications support in the event of a major spill incident.

**Telephones:** Telephone support will have to be coordinated through the local telephone utility. The requirements for telephone support may overload the capability of some of the remote locations resulting in delays in acquiring a suitable number of lines. Long distance service may also be severely limited during initial operations.

Telephones and facsimile machines should be used to reduce radio traffic congestion. Direct "hot lines" to key officials may be required if normal landlines are continuously tied up. A major response may surpass the local telephone system's capability to handle a large volume of long distance calls. This is especially true for a command post located in a small village. Smaller communities would require the addition of new trunk lines for anything greater than a 50% increase in volume (several days delay).

GCI is now providing cellular phone service to nearly all Alaska communities. Some communities may also have cellular service by Alaska Communications Systems (ACS) and AT&T. ACS is the primary local telephone (landline) company, but GCI is also providing local and business telephone services. Cellular and local telephone services in the outlying communities is carried via a terrestrial microwave ring system.. This new system should solve any bandwidth or repeater-use problems and will greatly increase access to telephone and Internet resources for many more locations.

**Telefax:** Dedicate at least two facsimile machines to the command center. Fax machines may be purchased or rented on the local economy in the larger cities within the region. For remote responses, plan to deploy to the spill location with adequate fax capability since availability will be limited. Use one machine for incoming and one for outgoing traffic. Establish procedures very early in the response for sending, receiving, and distributing faxes. Publish the fax numbers within the Command Center so that these numbers can be referenced to agencies and organizations outside the command structure.

Another option to consider is a scan to fax or email capable machine. Local office supply companies do sell or rent multi-function printer/copier/scanner/fax machines. These units can often scan or fax directly if they are tied into phone or internet systems. Alternatively, they can scan to removable drives (USB drives) to be transmitted by other devices with internet access.

**Portable Telephones:** Cellular telephone coverage is rather limited in Alaska and cannot be relied upon as a primary means of communication throughout the state. Yet, cellular phones often can provide an additional means of maintaining communications with individuals outside the command center. The USCG's Pacific Strike Team has an International Maritime Satellite Organization (INMARSAT) Telesystem capable of transmitting and receiving calls from anywhere in the world. The system can also send and receive faxes. ADEC also has several of these systems on hand. ADMVA/DHSEM has five Personal Satellite Terminals (PST) on the American Mobile Satellite Corporation (AMSC) system and three on the INMARSAT system. ADMVA/DHSEM has 15 Iridium portable satellite phones and three Globalstar portable satellite phones available for deployment. The DOD/Alaska National Guard may also have available portable satellite communications packages available.

**Portable Radios:** Response teams, whether small boat crews or beach and land-based teams, will generally need portable VHF radios with 1 to 5 watts power; usually these radios have approximately 55 channels. Backup batteries, chargers, and extra radios will be required for extended responses. The responsible party/response contractor must provide adequate radios for their personnel. On the government side, ADEC has a number of portable VHF radios available for use throughout the state, and USCG Sector Anchorage has twelve handheld marine VHF radios, MSD Kenai has five, and MSD Kodiak has two. The USCG government vehicles (2) at Sector Anchorage also have VHF radios installed.

**Interpreters:** With the growing influx of other cultures into Alaska, plus the possibility of foreign-flag vessels, language barriers may arise. Response staff may need the skills of an interpreter. Local hospitals and the State Troopers are the two most likely sources for the names of available interpreters. EPA and USC Tribal Coordinators can assist in identifying interpreters of Alaska native languages.

**Portable Communications Trailers:** Portable communications trailers are rare in Alaska. The major industry response co-ops have the capability to establish portable communications centers, in either flyaway kits or road transportable units. The DOD has extensive communications that could conceivably be brought to bear in the event of a significant spill. ADEC, DMVA, and EPA maintain a command van trailer in Anchorage for deployment during spill responses. The Alaska State Troopers have a communications trailer available. The 103rd Civil Support Team (CST, Alaska National Guard) has a communications van available for use in special situations. The Navy Supervisor of Salvage (NAVSUPSALV) also has a command trailer, as does ADEC. DOD has extensive communications capabilities that could conceivably be made available in the event of a significant spill.

**Copiers:** Dependable, high volume copiers will be required in the command center. The size of the response will dictate the number of copiers required. Having more than one copier is advisable in the event that one machine breaks down from overuse.

#### **5420.2 – Federal**

**General:** The following is a description of USCG VHF and HF radio coverage in Alaska. The USCG provides VHF-FM throughout the Southeast and South Central coastal areas and two sites in the Bering Sea. This coverage is not continuous along the coast. High Frequency (HF) coverage provides additional coverage for offshore Alaskan waters. VHF-FM Communications are monitored continuously at Juneau, Valdez and Kodiak operated by USCG Sectors in Juneau and Anchorage. Each Communication Center has listening watches on VHF Channel 16 and 2182 KHz. Communication Station Kodiak (CommSta) provides 24 hour HF coverage on 2182 KHz and 4125 KHz. USCG cutters and aircraft have HF, VHF, and UHF capabilities during underway or air borne operations. All USCG ships (while in port) and shore stations in Alaska are interconnected with a wide area network. All data and recorded message traffic is carried on this network. Telephone service is available at all USCG units. Cellular phone capabilities are available throughout large areas of the state's coastal areas and along the road system. The Juneau USCG District Office maintains a sole satellite capability with other DOD entities.

Each Communication Center can be contacted via VHF-FM channel 16. For communications in Southeast Alaska, Upper Cook Inlet (Site Summit High Site) and the Bering Sea (Cold Bay and St. Paul Island) contact the Sector Juneau Command Center. For Prince William Sound, communications contact Sector Anchorage Command Center. Valdez and Kenai Peninsula, Cook Inlet and Kodiak Island communications are Sector Anchorage Command Center.

**USCG Communications Capabilities:** The following are USCG Aircraft, Ship, and Shore Station communications capabilities.

1. C-130 (Fixed wing), H60, and HH65 (Helicopter) Communications Capabilities:
  - HF 2-30 MHZ
  - VHF 30-87.975 MHZ, Guard 40.5
  - VHF 108-117.975 MHZ, AM, RX only
  - VHF 118-155.975 MHZ, AM TX/RX, Guard 121.5
  - VHF 156-173.95 MHZ, FM, Guard 156.8 (Channel 16)
  - UHF 225-399.975 MHZ, AM, Guard 243.0
  - ADF FULL DF CAPABILITIES EXCEPT FOR HF
2. Patrol Boats (WPB), and Buoy Tenders (WLB):
  - HF 2-30 MHZ
  - VHF-FM 146-174 MHZ, Preprogrammed channels only, State Trooper 155.2500, and State Disaster 155.2950 are preprogrammed.
  - VHF-FM 156-162 MHZ marine band
  - UHF 225-399.975 MHZ
3. USCG Shore VHF-FM Fixed Sites:

| Prince William Sound/Sector Anchorage Area: |                 |
|---------------------------------------------|-----------------|
| CAPE HINCHINBROOK HF                        | 601416N1463852W |

The above National Distress System (NDS) high sites are monitored 24 hours a day, 365 days a year from Sector Juneau, Airsta Kodiak and MSU Valdez. Those locations listed beneath are remoted to the respective control station by landline, microwave, UHF, or VHF or a combination thereof.

- All sites (except those under Valdez) have the following channels: 6, 12, 16, 21A, 22A, 81A
- Valdez (except for Cordova) have channels: 6, 13, 16, 21A, 22A, 81A
- Cordova has channels: 13, 16, 21A, 22A

Those locations marked (HF) Guard 2182 KHz International Distress and calling frequency are capable of operation in the 2-30 MHz range, but on preprogrammed frequencies only. They DO NOT contain any State or Local emergency frequencies. Changes require a technician to physically go to the remote site and reprogram the frequency; they are not remotely changeable/programmable.

Communications Station (CommSta) Kodiak maintains a full long-range HF capability 2-30 MHz.

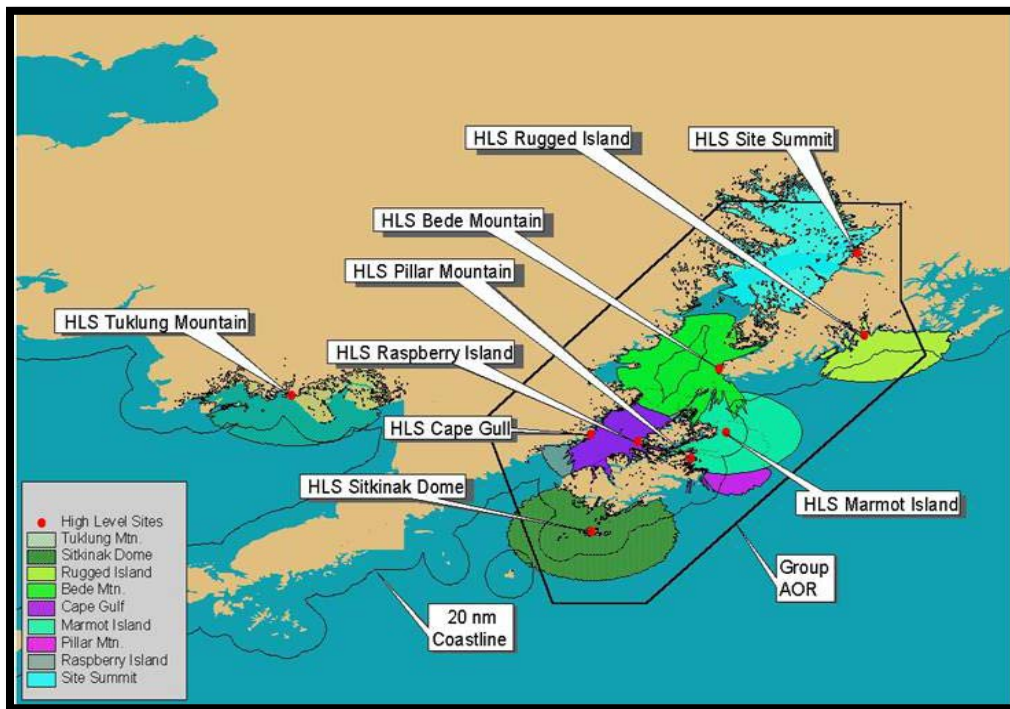

#### 4. Portable Communications Capabilities:

**Kodiak Air Station (AirSta) Capabilities:** Hand held VHF-FM radios, 156-162 MHz

**Kodiak Communications Station (CommSta) Capabilities:**

- 1) URC 94 (1 each), HF/VHF AM/FM/CW/SSB Upper/Lower Sideband, Transceiver, HF 1.5-29.999 MHz, 100 Watts, 12,000-mile range. VHF 30.0-79.999 MHz, 50 Watts, 5-mile range.
- 2) ARC 94, 2-30 MHz, 1k increments, 125 Watts
- 3) ARC 190, 2-30 MHz, 100 Hz increments, 400 Watts
- 4) ARC 618, 118-135.9 MHz, 1k increments
- 5) RC 513, 150-173.995 MHz, 25k increments
- 6) ARC 159, 225-399.975 MHz, 25k increments
- 7) ARC 182 V/U, 1 VHF 30-87.975 MHz, Guard 40.5
- 8) 2 VHF 108-117.975 MHz, AM, RX only
- 9) VHF 118-155.975 MHz, AM TX/RX, Guard 121.5
- 10) 3 VHF 156-173.95 MHz, FM, Guard 156.8 (Channel 16)
- 11) 4 UHF 225-399.975 MHz, AM, Guard 243.0

**Figure 5-2: USCG VHF Tower**

### **5420.3 – State**

The ADEC currently operates an assortment of communications equipment, including a variety of VHF hand-held and base station radios, portable repeaters, repeater extenders, and portable satellite phones. Additionally, sixteen wide-area mountaintop VHF repeater sites in Juneau, Prince William Sound, the Kenai Peninsula, the Anchorage area, Fairbanks, Kodiak and the North Slope are available to enhance area communications.

ADEC is also part of the [Alaska Land Mobile Radio \(ALMR\)](#) system.

ADEC communications equipment is maintained by the logistics staff, which can be reached at 465-5234 in Juneau or 344-7380 in Anchorage. The Alaska Department of Administration Enterprise Technology Services (ETS) branch provides communications support and can be reached at 269-5781 in Anchorage.

The ADEC maintains three communications flyaway kits statewide (one each in Fairbanks, Anchorage, and Juneau) to support on-scene operations. Each kit consists of a VHF/FM base station radio with two 12-volt batteries and supporting hardware (the radio can also operate on commercial power). In addition to the flyaway kits, ADEC has portable suitcase repeater systems, which will provide extended range for on-scene communications. Two UHF suitcase repeater systems are also available, along with 48 compatible handheld transceivers. Four 100-watt portable generators can be deployed to provide power for the communications equipment.

The State DMVA Division of Homeland Security and Emergency Management also acquired a Mobile Emergency Operations Center (MEOC). General facts and information on the MEOC are provided below. The MEOC can be deployed anywhere along Alaska's road system to support a major response operation.

**Vehicle Specifications:**

- Make/Model Freightliner Columbia
- Length: 45 feet
- Licensed Gross Weight 56,000 pounds
- Dispatch Weight (full fuel) 41,000 pounds approximately
- Fuel Capacity 140 gallons (3 days' supply at full electrical load)
- Emergency Vehicle Equip. Lights, siren, public address
- Internal & External lighting White/Red internal with external floods
- Electrical Separate Chassis and Coach battery systems for DC
- Two 12.5 KW generators to support AC load

**Command Center Capabilities:**

- Configured to support a Unified Command level incident.
- Command center will support 10 workstations with laptops.
- Spare dispatch position in Command Center
- High Speed satellite system; supports video conferencing, VOIP phones, Wi-Fi and internet.
- Self-erecting and self-orienting satellite system.
- Supports up to 16 Voice Over Internet Protocol (VOIP) telephones via satellite.
- Receive and record both analog and digital broadcast television.
- External tower mounted (pneumatic extension/retraction) high-resolution color video camera with full optical and digital zoom via remote control.
- Multiple video screens with video management panel and external video capability.

**Dispatch Center Capabilities:**

- Four computer aided dispatch positions utilizing Telex C-Soft software with full patch capability.
- Headsets, boom microphones and foot switches available to dispatchers
- Hard mounted ergonomic dispatcher seating.
- Four ALMR mobile radios, panel mounted
- Two Conventional VHF radios, panel mounted
- High and Low UHF radios, panel mounted
- 700/800 MHz (AWARN) radio, panel mounted
- Marine Radio, panel mounted
- VHF AM aircraft radio, panel mounted for Air-Ground comm.
- ARES capable amateur radio
- Citizens Band radio
- On board ALMR capable portable radio cache with gang charger

**Support Equipment:**

- 24 inch plotter for maps, drawings, etc...
- Fax/copier
- Document printer
- Fridge, microwave and coffee pot for extended deployment (comfort items)
- Support trailer with storage space to house up to 5 personnel for extended deployment

ADEC owns three portable repeaters, available from the Juneau office (465-5239), the Fairbanks office (451-2145), and the Anchorage ADEC warehouse (344-7380). Repeater channel coverage is shown in the following table:

| ADEC Portable Repeater Channels | Operating Frequencies |       |         |
|---------------------------------|-----------------------|-------|---------|
|                                 | Transmit              | PL    | Receive |
| ADEC Channel 1                  | 154.755               | 141.3 | 159.255 |
| ADEC Channel 2                  | 154.815               | 141.3 | 159.285 |
| ADEC Channel 3                  | 154.830               | 141.3 | 159.315 |

#### *5420.3.1 – Mobile Emergency Operations Center (MEOC)*

The DMVA maintains the Unified Command Mobile Emergency Operations Center, which is available for a spill response if requested by ADEC. The State originally commissioned the mobile facility for establishing an emergency operations center at the Yukon River Bridge in the event of a threat to the Trans-Alaska Pipeline, a critical State resource under the federal Buffer Zone Protection Plan of 2006. The fact sheet below provides details on this transportable operations center.

#### **MOBILE EMERGENCY OPERATIONS CENTER (MEOC) FACT SHEET**

##### **Truck Specifications:**

**Make/Model:** Freightliner Columbia

**Length:** 45 feet

**Licensed Gross Weight:** 56,000 pounds

**Dispatch Weight (full fuel):** 41,000 pounds approximately

**Fuel Capacity:** 140 gallons (3 days' supply at full electrical load)

**Emergency Road Equip.:** Lights, siren, public address

**Internal/External lighting:** White/Red internal with external floods

**Electrical:** Separate chassis and coach battery systems for DC; Two 12.5 KW generators to support AC load

##### **Command Center Capabilities:**

- Configured to support a Unified Command level incident.
- Command center will support 10 workstations with laptops.
- Spare dispatch position in command center
- High-speed satellite system; supports video conferencing, VOIP phones, Wi-Fi, and internet.
- Self-erecting and self-orienting satellite system.
- Supports up to 16 Voice Over Internet Protocol (VOIP) telephones via satellite.
- Receive and record both analog and digital broadcast television.
- External tower mounted (pneumatic extension/retraction) high-resolution color video camera with full optical and digital zoom via remote control.
- Multiple video screens with video management panel and external video capability.

##### **Dispatch Center Capabilities:**

- Four computer-aided dispatch positions utilizing Telex C-Soft software with full patch capability.
- Headsets, boom microphones, and foot switches available to dispatchers
- Hard mounted ergonomic dispatcher seating.
- Four ALMR mobile radios, panel-mounted
- Two Conventional VHF radios, panel-mounted
- High and Low UHF radios, panel-mounted
- 700/800 MHz (AWARN) radio, panel-mounted
- Marine Radio, panel-mounted
- VHF AM aircraft radio, panel-mounted for air-ground comm.
- ARES-capable amateur radio
- Citizens Band radio
- On-board ALMR-capable portable radio cache, with gang charger

##### **Support Equipment:**

- Document printer
- Fax/copier

- 24-inch plotter for maps, drawings, etc.
- Refrigerator, microwave, and coffee pot for extended deployment (comfort items)
- Support trailer with storage space to house up to five personnel for extended deployments.

#### **5420.4 – ALMR**

**Alaska Land Mobile Radio (ALMR)** – The State of Alaska, the Department of Defense, other federal agencies in Alaska, and local municipalities have joined together in a consortium effort to design, build, and operate and maintain a fully interoperable wireless communications system in Alaska, the Alaska Land Mobile Radio Project (ALMR). The primary objective of ALMR is to provide a reliable and secure emergency communications system for all emergency responders in Alaska, especially for multi-agency responses to emergencies and critical situations.

ALMR is a two-way radio system used by first responders and public safety officials for instant, effective, and private communications during everyday operation. It also provides the efficiency, security and flexibility required during emergencies for communications on demand and in real time.

The ALMR transportable capability provides coverage in areas outside the range of the fixed infrastructure to increase capacity during an emergency or event, or to provide temporary communications for a site where communications are down. The transportable capability includes four skids. The communications skid houses a five-channel, P25 trunk site and provides connectivity to support voice, data, internet, telephone and video. The dispatch skid provides for two dispatch locations along with control of the gateway and foreign radio equipment, acquisition and control of the satellite skid, systems monitoring and mesh network control. The tower/generator skid provides power and a crank-up microwave tower. The C and K-U band satellite skid provides reach back capability, as well as robust bandwidth to support National Incident Management System implementation at remote sites. Each skid is military air transportable and complies with requirements for both military and commercial sling lift operations, and is ground-transportable on flatbeds, meeting standards and regulations for transport along state and interstate highways.

The ALMR coverage in the State of Alaska is primarily in the Interior, Southcentral and Southeast areas of the state. For those areas of Alaska not currently within the ALMR coverage, the State of Alaska Department of Military and Veterans Affairs (ADMVA) has coordinated with state and local agencies to develop a Statewide Communications Interoperability Plan (SCIP) to address the interoperability needs of those areas. The plan envisions local entities applying for federal grants to purchase communications equipment appropriate to those communities to allow them to communicate with regional response communities through portable, tactical, interoperable IP gateway devices. For specific details of the SCIP, contact ADMVA. For additional information on the ALMR, Reference [the Alaska Land Mobile Radio website](#).

ALMR provides first responders and public safety officials' instant, effective, and private communications during everyday operation and the efficiency, security and flexibility required during emergencies for communications on demand and in real time. It is a system providing interoperable communications using disparate radios, voice communications, whether they are open or encrypted, to other users authorized to be in the same talkgroup. Essentially, these radios are computers capable of transmitting voice and data, but can provide a number of other functions to assist the first responder carrying the radio.

Connectivity between the ALMR sites is provided by the State of Alaska Telecommunications System and the Municipality of Anchorage microwave systems, which enables ALMR users to communicate radio to radio anywhere in the ALMR coverage area, which is primarily along the road system.

The ALMR Help Desk is the single point of contact for ALMR Operations Management and Maintenance services. The Help Desk provides customers with problem, issue and complaint resolution. Services include account set up and update, radio checks, lost or stolen radio services, and general troubleshooting. Regular Business Hours are 8:00 am to 5:00 p.m., Monday through Friday After-hours (includes federal holidays): Call the Help Desk and follow the prompts to notify Motorola. An on-call technician will be notified.

The State of Alaska Telecommunications System (SATS) microwave network provides the wide-area connectivity for the Alaska Land Mobile Radio (ALMR) Communications System. Therefore, ALMR primarily provides coverage along the major road system and in some portions of Southeast Alaska. Recognizing the potential need for communications outside the ALMR coverage area and SATS infrastructure, two transportable/deployable, self-contained ALMR sites were designed and built for the Department of Defense. The transportable systems are assets of Joint Task Force, Alaska. In an emergency, and when approved by the Commander Alaskan Command, the units can be deployed anywhere in the state by truck, heavy-lift helicopter, or large cargo aircraft. The Transportable Communications Systems are designed to integrate into the existing ALMR fixed infrastructure. The following is a basic description of the shelters/skids and their functions.

**The Communication Shelter** module is approximately 9 feet wide, by 16 feet long, by 9 feet high. It contains a five-channel RF site, satellite control interface, an unlicensed 5.8 GHz microwave radio, a central electronics bank (CEB) and a 48 VDC battery plant for eight hours run time.

**The Dispatch Shelter** is approximately 9 feet wide by 16 feet long by 9 feet high. It contains one Motorola® Gold Elite console position and a conventional UHF and VHF radios, marine band and air-to-ground radios, a MotoBridge® RGU, OMC, ACP, SIP Server, WSGU, and dispatch position.

**Tower/Power Skid** is approximately 9 feet wide by 20 feet long and contains a 35KW self-contained diesel generator and integral fuel tank designed for three continuous days of operation at half load. It also contains a 50-foot, powered crank-up tower. It has permanently mounted antennas for the trunked RF site and two conventional frequencies.

**Logistics Skid** is utilized to store ancillary equipment supporting the transportable during deployment. It also serves as a facility for maintenance operations while in the deployed state.

Contained within the Logistics Skid is the Unclassified Deployable Mesh (UDM) Network. Mesh network technology was originally developed for the military battlefield to provide instant, ad-hoc communication networks where fixed infrastructure was not available or deployable. The Mesh also provides Wi-Fi access, security and real-time video, dedicated licensed network connectivity, and a license-free mobile broadband that is self-forming and self-healing and can deliver seamless data connections and real-time video transfers to vehicles moving at highway speeds. The Logistics Skid measures 9 feet wide, by 20 feet long, by 9 feet high.

### **Rapid Deployable System**

The Rapid Deployable System Shelter provides a fast, easy, durable, and versatile structure for first responders, command posts, operations centers, or other remote operation uses.

#### Cellular and Satellite Communications

Presently, cellular telephone coverage is limited in the Aleutians region to small individual carriers that do not have roaming agreements with the larger carriers. Companies currently offering cell phone service include Alaska Wireless and Bristol Bay Cellular. Other cellular phones with “roam” capability may also work at certain locations. This capability is unpredictable and dependent on multiple factors that affect the capacity of cellular towers to handle additional carriers.

#### Cellular Companies

| Company              | Phone    | Areas of Coverage                       |
|----------------------|----------|-----------------------------------------|
| Alaska Wireless      | 581-5071 | Unalaska/Dutch Harbor w/minimal roaming |
| Bristol Bay Cellular | 581-4555 | Roaming in Unalaska/Dutch Harbor        |

#### 5420.6 – Bristol Bay

**Cellular and Satellite Communications:** Presently, in the Bristol Bay Geographic zone, cellular telephone coverage is limited, but available within most communities. However, as stated above, coverage problems should be solved with the addition of the terrestrial microwave ring system.

#### 5420.7 – Cook Inlet

A system of seven fixed repeaters in the Cook Inlet Geographic zone allows for a wide range of VHF radio coverage. The seven repeaters and their operating frequencies are as follows:

**ADEC Fixed Repeaters – Cook Inlet Geographic zone**

| Location                                                    | Transmit | PL Code | Receive |
|-------------------------------------------------------------|----------|---------|---------|
| Mount Susitna (DECMTSUE)*                                   | 158.775  | 127.3   | 151.070 |
| Hope (RPTHOP)*                                              | 158.925  | 127.3   | 51.040  |
| Gore Peak (DECJKGOR)**                                      | 154.755  | 114.8   | 159.255 |
| Pipeline Hills (RPTPIPHL)**                                 | 159.420  | 103.5   | 151.340 |
| Ski Hill (DECSKIHL)<br>[Primary Use in Kenai/Soldotna Area] | 158.925  | 114.8   | 151.040 |
| Mount Bede (RPTLLBD)**                                      | 159.390  | 114.8   | 151.370 |
| Rugged Island (RPTRUGED)**                                  | 154.830  | 127.3   | 159.315 |

\* Anchorage Repeater System (repeaters are simulcast)

\*\* Kenai Repeater System (repeaters are simulcast and includes the Shuyak Island repeater as well)

Alaska Dept. of Natural Resources, Division of Forestry – Radio Communications Assets:

The following provides an inventory of ADNR-DOF radio communications assets in the Cook Inlet Geographic zone. ADNR-DOF VHF and UHF repeater locations are listed below.

RTI – There is a Remote Telephone Interface (RTI) located on Mt. Susitna. This allows radios in the Anchorage area to connect with the phone system and then make phone calls. This is used by State Parks, USFS, and DOF. Each agency has eight radios that access the system.

Intercom - All SCRO offices are connected via the State Microwave system.

Repeaters - The AMSA office has one UHF Repeater (Mt Susitna), and four VHF Repeaters (Mt Susitna, Government Peak, Byers Lake, and Site Summit). Reference Table 2 for information on these repeaters.

ADNR-DOF Southcentral Regional Office (SCRO) - Anchorage: 269-8463 Fax: 269-8931  
DOF's Southcentral Regional Office (SCRO) can transmit (Tx) and receive (Rx) on all the repeater frequencies for the region. They also have an intercom connection to the three area SCRO locations at Big Lake, Kenai, and Copper River through the State microwave system.

DOF Anchorage/Mat-Su Area Forestry (AMSA) - Mat-Su: 761-6300 Fax: 761-6319  
The Dispatch office is located 8.2 miles down the Big Lake Cut-off at Mile 54 of the Parks Highway.

DOF Kenai/Kodiak Area Forestry (KKAFF) - 262-4124/762-2373 Fire: 262-5528 Fax: 262-6390  
The KKAFF Dispatch office is located 1.5 miles east of Soldotna city center. This office has a primary console and a Desktrak 14-channel programmable base station.

**\*\*USCG working channels only; monitor only, unless permission received from local USCG Command authorizing use while working a spill or a drill.**

**Cellular phone** coverage in the Cook Inlet region has improved significantly in recent years. Currently, AT&T, GCI, Matanuska Telephone Association (MTA), and Verizon provide cell services. Wireless data service is also available from these providers. Currently 4G data is available throughout the major road corridors where voice coverage is also available. It should be noted that mountainous terrain restricts cell coverage in many areas, even on the highways. In locations with marginal cell phone service, text messaging may be more effective and reliable than voice service.

Network Service Limitations: Responders to an area should confirm if there are any network service limitations. Some service providers have limitations based on the version or generation of phone technology, in-network versus 'roaming' service, and type of service contract (monthly contract vs. 'pay-as-you-go.' 'Roaming' cellular service may be limited based on the network load or capacity and the generation of technology used. In the event of high network utilization, the host service provider may limit the roaming service available. Many service providers prioritize roaming service (including service access or quality) to the latest generation of cell phone devices. "Pay-as-you-go" contracts or devices may also have a more restricted coverage area.

The footprints of cellular phone coverage in the Cook Inlet Geographic zone are changing frequently, with service improving and coverage zones expanding. For current information, consult the providers' websites. For information on coverage in a specific location, a call to that community is recommended to determine the best options for cellular communications.

#### **5420.8 – Kodiak**

**Telephones:** Kodiak is now connected to the mainland by two fibrotic cables, which should remove any bandwidth issues for the connected areas. However, outlying communities may still experience problems and a major response may surpass the local telephone system's capability to handle a large volume of long distance calls.

**Cellular and Satellite Communications:** Presently, in the Kodiak Geographic zone, cellular telephone coverage is limited. However, as stated above, coverage problems should be solved with the addition of a terrestrial microwave ring system in 2009/2010.

#### **5420.9 – North Slope**

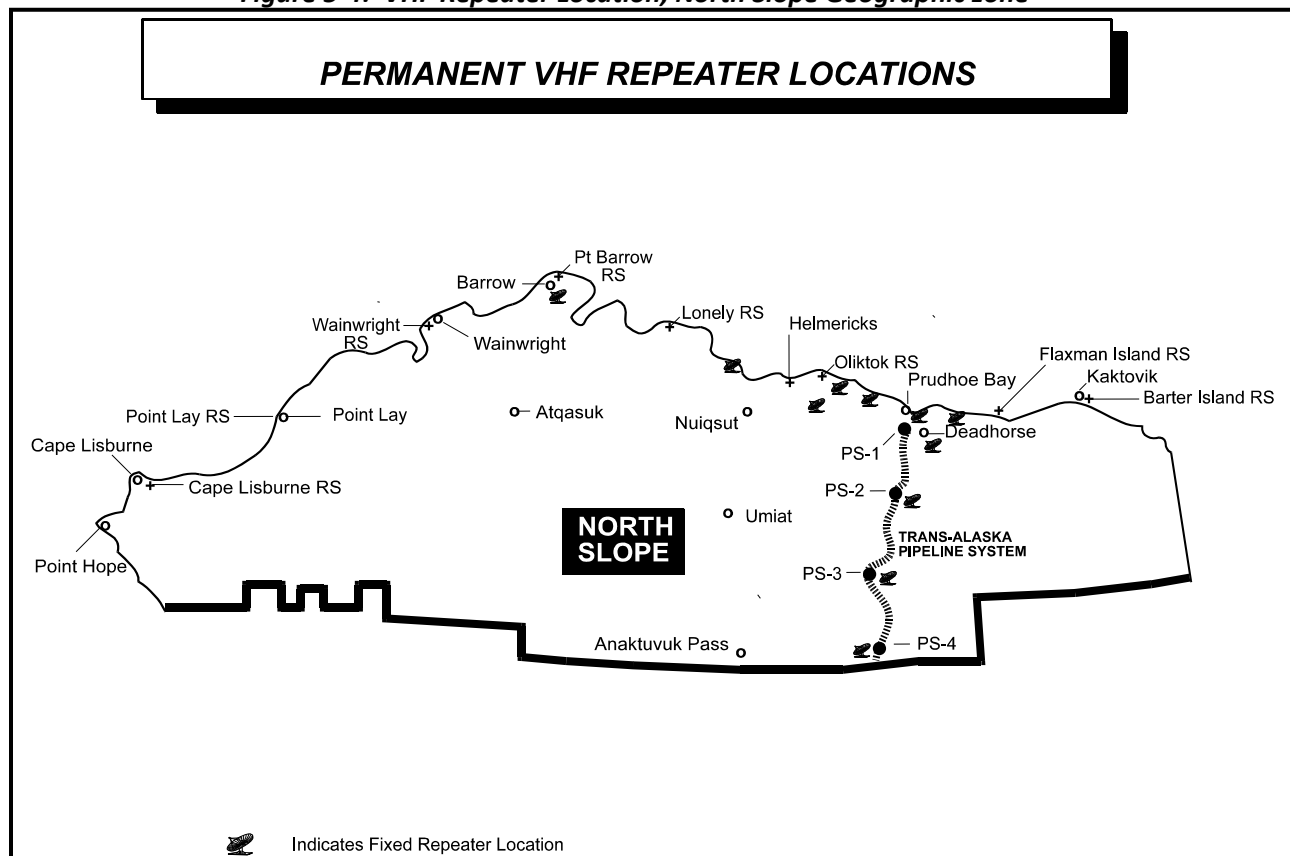

**Radio Communications:** For a current listing of Alaska Clean Seas communications assets, please Reference the ACS Tech Manual, Volume 1, Tactic L-5.

**Cellular and Satellite Communications:** Presently, cellular telephone coverage is limited in the North Slope Alaska region to the Prudhoe Bay area. Limited service may be available in Barrow as well. Companies currently offering cell phone service include ACS and Alaska DigiTel. Figure B-2 shows ACS cell phone coverage. Other cellular phones with “roam” capability may also work at certain locations. This capability is unpredictable and dependent on multiple factors that affect the capacity of ACS cellular towers to handle additional carriers.

| Alaska DigiTel                                                                                                                                                                                                                                                                                                                                     | 274-3114<br>888-530-3114 | Provides analog roaming service using ACS towers. However, ACS can block non-ACS customers from “roaming” on their infrastructure to prevent system overloads or other problems. |
| **Note: ACS has a cell tower in Barrow. However, at present only phones with a Barrow phone number can make or receive cell phone calls in Barrow. Due to the older technology format of the Barrow tower, it is unknown whether FCC rules will allow ACS to sell additional phones that function on the “old network” for use in the Barrow area. |                          |                                                                                                                                                                                  |

**Figure 5-5: Cellular Phone Coverage in North Slope Geographic Zone, provided by ACS**

Some other carriers may roam on the ACS wireless network if capacity allows for additional users. Alaska DigiTel is the only confirmed cellular communications provider in Alaska that has such an agreement with ACS; other Lower 48-based providers may also have agreements.

#### **5420.10 – Northwest Arctic**

The ADEC does not maintain any fixed communication equipment in the Northwest Arctic.

| **USCG working channels only; monitor only, unless permission received from local USCG Command authorizing use while working a spill or a drill. |   |  |          |          |

**Cellular phone:** Network Service Limitations: Responders to an area should confirm if there are any network service limitations. Some service providers have limitations based on the version or generation of phone technology, in-network verses 'roaming' service, and type of service contract (monthly contract vs. 'pay-as-you-go.' 'Roaming' cellular service may be limited based on the network load or capacity and the generation of technology used. In the event of high network utilization, the host service provider may limit the roaming service available. Many service providers prioritize roaming service (including service access or quality) to the latest generation of cell phone devices. "Pay-as-you-go" contracts or devices may also have a more restricted coverage area.

The footprints of cellular phone coverage are changing, with service improving and coverage zones expanding. For current information, consult the providers' websites. For information on coverage in a specific location, a call to that community is recommended to determine the best options for cellular communications.

Cellular Coverage Website:

- AT&T <http://www.att.com/maps/wireless-coverage.html>
- GCI <http://www.gci.com/wireless/coverage>
- MTA Wireless <https://www.mtasolutions.com/images/Mobile/MTACoverageMap.pdf>
- Verizon: <https://ss7.vzw.com/is/content/VerizonWireless/eCatalogs/Alaska-Maps-Voice-Data-Final.pdf>

As noted above, cellular telephone coverage is limited. The most extensive coverage in Western Alaska, including the Northwest Arctic Geographic zone is provided by GCI.

#### **5420.11 – Western Alaska**

Portable repeaters can increase the communication range several fold depending upon where the repeaters are placed. Portable repeaters are also listed along with in-State location, owning agency, and operating frequencies.

#### **Alaska Department of Natural Resources, Division of Forestry – Radio Communications Assets:**

Information on the Alaska Department of Natural Resources' Division of Forestry is also provided in this section. The Dispatch office is located in McGrath adjacent to the runway. The following provides an inventory of ADNRF-DOF radio communications assets in the Western Alaska geographic zone.

#### **DOF Southwest Area Forestry (SWAF)**

## **6000 – FINANCE/ADMINISTRATION**

---

### **6100 – FINANCE/ADMINISTRATIVE SECTION ORGANIZATION**

The following are helpful resources for establishing a case specific finance/administrative section organization:

- [The USCG Incident Management Handbook](#)
- [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response.](#)

Note: None of these guides is specifically prescribed by this plan, and none is mandated for use by response plan holders or potential responsible parties. Federal and State On-Scene Coordinators will work with the response organization established by the responsible party in responding to and managing oil or hazardous substance releases as long as their organization is compatible with ICS principles

### **6200 – FUND ACCESS**

#### **6210 – Federal On-Scene Coordinator (FOSC) Funding**

The Seventeenth USCG District approves FOSC requests to respond to actual or substantial threat of oil pollution incidents. Procedurally, FOSC staff contacts the NPFC to request a federal pollution number and initial project ceiling. The pollution number is referenced in all subsequent correspondence. Obligation of funds is tracked to ensure the ceiling is not exceeded. For details regarding documentation and cost recovery Reference [NPFC Instruction 16451.2](#).

#### **6220 – State Funding**

State governments may request up to \$250,000.00 from the OSLTF via the appropriate FOSC. Procedures for state governments to access the OSLTF are outlined in [NPFC Instruction 16451.1](#).

For details on the state Oil and Hazardous Substance Release Prevention and Response Fund (OHSRPRF), reference [Section 6310.2](#).

#### **6230 – Trustee Funding**

The OSLTF is available to pay for response or removal actions carried out under FOSC direction. The NPFC designates the total amount of money available and assigns a Federal Pollution Number (FPN) for the FOSC. Federal agencies working for the FOSC may request funds from the FOSC to pay for their activities.

1. When an agency is notified of an incident, joint discussions between the FOSC and that agency's representative shall occur to determine if it is appropriate for the agency to participate and support the FOSC.
2. If participation in the response is appropriate, a request for funding shall be made to the FOSC. Initially, the request can be made orally but must be quickly followed by a written request.
3. The funding request shall include anticipated tasks, estimated costs, and the total amount of funding needed for the duration of the response.
4. Authorization comes from the FOSC in the form of a signed and dated Pollution Removal Funding Authorization (PRFA). The PRFA includes the activities to be funded, the amount of money

available, and an FPN. The FPN must appear on all incident documentation. The signed PRFA is used as agency authorization to invoice the NPFC for reimbursement of response costs.

5. It is necessary to fully document all costs associated with authorized response expenditures. Records must include salaries and benefits, daily transportation costs, individual per diem, authorized overtime costs, material costs, equipment costs (owned or rented), and authorized contractor costs.
6. If at any time during the response, it appears that the agency will exceed the PRFA ceiling, there must be an IMMEDIATE written request to the FOSC to increase the ceiling. The request must include detailed activities and costs. If an increase is approved, the FOSC will issue an amendment to the PRFA.

The [NPFC User Reference Guide \(eURG\)](#) is available online at USCG, NPFC website.

## **6300 – COST**

### **6310 – Cost Recovery**

#### **6310.1 – Federal - TBD**

#### **6310.2 – State**

ADEC is responsible for cost recovery of Oil & Hazardous Substance Release Prevention and Response Funds (OHSRPRF). ADEC will participate with the Department of Law in cost recovery agreement negotiation. Each participating agency will receive written notification of its responsibility under the cost recovery process. AS 46.08.020 requires that:

- a) Money recovered or otherwise received from parties responsible for the containment and cleanup of oil or a hazardous substance at a specific site, excluding funds for performance bonds and other forms of financial responsibility held in escrow pending satisfactory performance of privately-financed response action; and
- b) Fines, penalties, or damages recovered for costs incurred by the state because of the release or threatened release of oil or a hazardous substance shall be deposited in the general fund and credited to the special account called the "oil and hazardous substance response fund."

As such all monies shall be collected and deposited by the Department of Law/ADEC.

*Cost Recovery Direct from Responsible Party:* In cases of cost recovery direct from the responsible party, each participating agency may be required to provide documentation to the liable party and to ADEC for cost recovery. Written notification of procedures shall be provided by ADEC to each participating agency. Each agency shall be required to maintain records related to the cost recovery process. Specific record keeping requirements shall be outlined in writing by ADEC to each participating agency but shall include at a minimum:

- Expenditures Incurred
- Expenditures Submitted for Cost Recovery
- Expenditures Recovered

*Cost Recovery through Litigation:* In cases of cost recovery through litigation, each participating agency may be required to provide documentation to the Department of Law and to ADEC for cost recovery. Written notification of procedures shall be provided by ADEC to each participating agency.

## **6320 – Cost Documentation, Procedures, Forms & Completion Report**

### **6320.1 - Federal**

All federal cost documentation, procedures and forms can be accessed at the NPFC website:  
Regulation/Guidance - <https://www.uscg.mil/Mariners/National-Pollution-Funds-Center/URG/>  
Forms - <https://www.uscg.mil/Mariners/National-Pollution-Funds-Center/Forms/>

### **6320.2 – State**

**Fund Expenditures:** Activation of a multi-agency State response organization will occur when there is a major or extended incident. Many responses contain emergency elements which must be addressed immediately, and ongoing operations for which use of the Oil and Hazardous Substance Release Prevention and Response Fund (OHSRPRF) may be planned. Therefore, each participating agency should be aware of, and comply with, its policies and procedures for financial and accounting issues, and must be aware of emergency exceptions to its policies, procedures, and constraints for reimbursement from the OHSRPRF. Failure to comply with requirements for expenditures from the OHSRPRF shall preclude reimbursement of expenditures.

Expenditures made directly from or reimbursed from the OHSRPRF will have unique tracking requirements for both legislative reporting and cost recovery documentation. Due to the multi-agency involvement in ICS, it is important that all agencies understand the documentation and reporting requirements prior to obligating funds.

- 1) ADEC - ADEC shall expend and obligate money directly from the OHSRPRF. ADEC shall be responsible for a consolidated report on expenditures reimbursed from the OHSRPRF for initial response, cleanup, and recovery operations at the conclusion of the incident. The report shall address items required in agency reporting requirements, below.

Under AS 46.08.045, the Commissioner can access the response fund for an oil or hazardous substance discharge when it is a declared disaster, or if there is no declared disaster, by providing proper notice to the governor and legislature.

- 2) Other Agencies - Other State agencies should only incur obligations and expenditures after receiving a request for involvement and work plan approved by the State On-Scene Coordinator (SOSC). Obligations and expenditures not requested by the SOSC will not be reimbursed from the OHSRPRF.

Other agencies may seek reimbursement from the OHSRPRF by one of two methods: Inter-Departmental Accounting Journal Entries (AJE's) or Reimbursable Services Agreements (RSA's). In both cases, supporting documentation requirements may be in excess of standard State requirements. Thus, agencies should carefully review supporting documentation requirements. Requests for reimbursement shall be reviewed against OHSRPRF requirements and shall not be approved unless the documentation requirements have been met.

This reimbursement process may be amended if a cost recovery agreement is negotiated with a responsible party that adds or changes reporting requirements. ADEC shall provide written notification to all participating State agencies in such a case.

- 3) University of Alaska - Documentation requirements and access to the OHSRPRF for the University of Alaska has the same standard documentation and reporting requirements as other agency involvement, but reimbursements shall be through a general warrant.

### **Fund Expenditure Methods**

*Inter-Departmental Accounting Journal Entries* - The document shall include:

- ☐ Transaction Screen Printout
- ☐ Audit Trail Printout, Showing Expenditures
- ☐ Copies of Invoices, Procurement Documentation, Travel Documentation, Time Sheet, Warrant Register
- ☐ Narrative justification for the expenditure that addresses the specific reason for each expenditure as it relates to the approved work plan for that agency
- ☐ Other information to aid ADEC in the approval process
- ☐ Other information to aid ADEC in the cost recovery process
- ☐ Name and telephone of agency contact for additional information

All inter-agency accounting journal entries shall be approved by the SOSC or his/her designee prior to authorization and certification by ADEC.

*Reimbursable Services Agreements (RSA's)* - The execute document shall include:

- ☐ Transaction Screen Printouts
- ☐ Audit Trail Showing Expenditure
- ☐ Copies of Invoices, Procurement Documentation, Travel Documentation, Time Sheet, Warrant Register
- ☐ Narrative justification for the expenditure, addressing specific reasons for each expenditure as they relate to the agency's approved work plan
- ☐ Other information to aid ADEC in the approval process
- ☐ Other information to aid ADEC in the cost recovery process
- ☐ Name and telephone of agency contact for additional information

All RSA additions, executions, and amendments shall be approved by the SOSC or his/her designee prior to authorization and certification by ADEC.

*Required Reports* - All agencies shall be required to file reports on expenditures reimbursed from the OHSRPRF at the conclusion of their involvement in the response. The report shall address the following topics:

- ☐ Work Plan and Accomplishments
- ☐ Personal Services Expenditures by Name, PCN, Total Compensation and Services Performed
- ☐ One Time Purchases >\$10,000
- ☐ Contractual Agreements >\$20,000
- ☐ Equipment Purchases

### **Accounting**

Accounting functions (AKSAS) will rarely be located onsite. All agencies must use a unique accounting structure (such as ledger code, program code) or other tool to identify all expenditures by specific ICS project.

ADEC must receive written notification from each participating agency of the accounting structure being used to capture its authorization, obligations and expenditures. AKSAS Transactions for Inter Departmental AJE's for reimbursement by ADEC should be sent to ADEC RD 18128. AKSAS transactions for Reimbursable Services Agreement (RSA) executions, additions, and amendments for reimbursement by ADEC should be sent to ADEC RD 18128.

The State of Alaska maintains reimbursable petty cash accounts for small purchases (usually less than \$100.00). The balance of these accounts is normally under \$100.00. Field Warrants are used in situations that require immediate payment. They are limited to a maximum of \$1,000.00. Any amount over \$1,000.00 should be paid with an AKSAS generated general warrant.

**Personnel/Payroll** - Responsible Agency: DOA

Personnel and payroll actions are governed by the various collective bargaining agreements, Personnel Rules, and the State Administrative Manual, as well as individual departmental policies and procedures. In an initial activation of a multi-agency ICS, the Department of Administration shall take the lead role in establishing a core group, which will consist of one or more representatives from each of the following agencies:

- Department of Administration
- Division of Personnel
- Division of Labor Relations
- Division of Finance
- Department of Environmental Conservation
- All other State agencies with employees assisting in the cleanup efforts

The core group will address the following issues and any other issues as they arise to ensure consistency between departments:

- ❑ Overtime eligibility for Fair Labor Standards Act (FLSA) exempt employees
- ❑ Modifications to collective bargaining agreements through Letters of Agreement
- ❑ Time reporting form modifications to address unique reporting requirements of the incident
- ❑ Establishment of record keeping policies and procedures for volunteer corps
- ❑ Assist in position classification and hiring for large numbers of emergency hires and non-permanent staff, agency guidance and assistance. This assistance will be available to all agencies, but agencies may choose to follow the existing procedures without this assistance.
- ❑ Assist the Finance/Administration Section Chief in the hire and training of personnel/payroll staff to remain on site.

ADEC shall review each agency's equipment purchases and make a determination of equipment, which shall be required for the emergency response. The agency shall relinquish that equipment to ADEC for transportation to a local response conexus. The balance of equipment shall remain in the sole possession of the purchasing agency. The agency shall not be required to reimburse the OHSRPRF for equipment, which ADEC does not require for emergency response.

**Documentation** - Responsible Agency: ALL/ADEC/LAW

*Minimum Requirements* - Each agency shall immediately implement document control and collection procedures. In all cases telephone logs, correspondence, reports, time records, and field notes shall be considered part of documentation. Numerical document control by all participating agencies and a mechanism for centralized document control and retention shall be instituted at the agency level. All staff

shall be subject to a "Check in - Check Out" process through the Resource Unit of the Planning Section to ascertain that vital records are retained onsite.

*Additional Requirements* - Additional documentation and data management requirements shall vary by incident. ADEC, in conjunction with the Department of Law, shall establish the documentation and data management requirements for each incident. Attention shall be paid to cost recovery requirements. Each participating agency shall be provided written instructions by ADEC for documentation requirements in excess of minimums.

### **6320.3 – National Pollution Fund Center Technical Operating Procedures**

Utilize the following link for access to the NPFC Technical Operating Procedures (TOPS):

<https://www.uscg.mil/Mariners/National-Pollution-Funds-Center/Publications/tops/>

### **6320.4 – Finance and Resource Management Field Guide - TBD**

### **6330 – Reimbursable Expenses**

#### **6330.1 – Procedures for Reimbursement**

For reimbursement under the Oil Spill Liability Trust Fund, Reference the [Compensation/Claims](#) section of this document.

For local government reimbursement under the Comprehensive Environmental Response, Compensation and Liability Act, follow this link for information: <https://www.epa.gov/emergency-response/local-governments-reimbursement-program>

### **6340 – Liability Limits**

Limits of Liability as defined by OPA 90 are outlined in [33 CFR 138, Subpart B](#).

### **6400 – TIME - TBD**

### **6500 – COMPENSATION/CLAIMS**

#### **6510 –Claims against the OSLTF**

Guidance for submitting a claim under the Oil Spill Liability Trust Fund can be found at the following link: <https://www.uscg.mil/Mariners/National-Pollution-Funds-Center/Claims/>

#### **6520 – Compensation for Injury Specialist (INJR) - TBD**

#### **6530 – Claims Specialist (CLMS) - TBD**

### **6600 – PROCUREMENT**

#### **6610 – Contracting Officer Authority**

##### **6610.1 – Federal**

Federal contract authority for spill response falls under the Federal On scene Coordinator duties. Further guidance on this topic is found at the following link: <https://www.uscg.mil/Mariners/National-Pollution-Funds-Center/Response/>

##### **6610.2 – State**

Responsible Agency: DOA

Agencies are cautioned that procurement actions are governed by AS 36.30, the State of Alaska Administrative Manual, 2 AAC 12, Departmental Delegated Purchasing Authority Memoranda, as well as individual departmental policy and procedures.

In an initial activation of the multi-agency ICS, the Department of Administration shall establish an on-scene Procurement Office, using the designated contract support team (DCST); reporting to the Finance/Administration Section Chief. The Logistics Section Chief will work with the Procurement Office to ensure accounting practices and procedures are followed for all transactions.

Primary activities shall be to:

- ☐ Establish written term contracts for services.
- ☐ Eliminate State liability from verbal contracts through public notices.
- ☐ Assess and establish leases for office and other space.
- ☐ Provide assistance, as needed, to all participating agencies in contracting, emergency procurement, and reporting.
- ☐ Establish systems to provide adequate internal controls and communication between the finance procurement unit and the logistics supply unit.
- ☐ Coordinate with ADMVA/DHSEM and DOT/PF and Logistics to ensure ground transportation requirements are met.
- ☐ Assist in hiring and training staff for procurement functions.

### **7100 – INTRODUCTION**

This chapter profiles the hazards associated with extremely hazardous substances (EHS) in Alaska. It identifies the substances, where they are found, how they are transported, the risks they pose to the public, and the current capability of industry and government to respond to large-scale accidents.

EHS, for the most part, are those substances that pose an acute inhalation threat to humans. The distribution of EHS in Alaska falls into relatively distinct and predictable patterns. Hydrogen sulfide gas occurs only in association with crude oil production. Chlorine is found primarily at the municipal water and wastewater treatment facilities and seafood processing facilities of coastal southcentral and southeastern Alaska, as well as larger municipal facilities on the highway system. Anhydrous ammonia is found typically in coastal communities with seafood processing facilities. Sulfuric acid occurs at major industrial facilities and at remote communications facilities (as a battery electrolyte), and sodium cyanide is typically located at mining operations and transport facilities. Many of the more exotic substances occur at a small number of industrial or trans-shipment facilities.

Major routes and modes of transportation of EHS into and around the state are relatively simple. Interstate transport of EHS consists nearly exclusively of transport of substances into the state from the southern contiguous states by water. With a scattered and largely rural population, the potential for an accidental EHS release with catastrophic consequences – for example, affecting over 1,000 persons – in Alaska is confined to a handful of population centers. On the other hand, release consequences could still be great in many Alaskan communities when evaluated in terms of the percentage of a community's population affected and the degree of impact.

Response to an EHS release can be either defensive or offensive in nature. Defensive response measures include detecting a release, notifying the public and appropriate agencies, predicting plume movement, and protecting the public through evacuation or shelter-in-place tactics. Key to effective defensive response is a local emergency plan to guide the effort. A degree of defensive response capability exists in Alaska communities as evidenced by the existence of local emergency response plans in most communities.

Offensive response includes monitoring chemical concentrations and entering hazard zones to accomplish rescue, control, decontamination or other objectives. Key to effective offensive response is a well-trained, equipped and practiced Hazmat team. Such teams, though, are expensive to equip and train, and maintaining a level of proficiency commensurate with the risk to responders is costly. The Hazmat response teams of the Municipality of Anchorage, the 103rd Civil Support Team WMD (Alaska National Guard), and the City of Kodiak provide a degree of offensive response capability for their respective locales.

Areas with substantial risk and no or limited offensive response capability include the Kenai Peninsula Borough Planning District, the Aleutians East and Aleutian and Pribilof Planning Districts, the Bristol Bay Planning District, and the Northwest Arctic Borough Planning District.

### **7110 – Overview of Chemical Hazards**

This section discusses chemical hazards in general and those in Alaska particularly. It is intended to provide some background for readers that may not be familiar with the hazards posed by EHS.

- 1) **Release and Dispersion Mechanics:** EHS in Alaska include compressed and refrigerated gases, liquids and solids. The ways in which each is released and disperses in the environment differ.

**Gases:** Compressed and refrigerated gases can be released directly into the environment and spread under the influence of meteorological conditions. The rate at which a compressed gas is released depends on such factors as the amount of the substance in the container, the temperature of the substance, and the size of the hole through which the gas escapes. Once released, compressed gases spread in a downwind direction under the influence of meteorological conditions and gravity. The spread of compressed gases is particularly sensitive to wind speed. The slower the wind speed, the further high concentrations of gases will reach.

**Liquids:** Liquids are normally assumed to be dispersed into the atmosphere through evaporation. The evaporative rate is largely a function of chemical properties, the temperature of the liquid, and the surface area of the pool. The rate of release of liquids to the atmosphere through evaporation at normal temperatures is usually much slower than that for compressed gasses. As a result, even highly toxic liquids are far less likely to cause off-site impacts than the compressed gasses, provided the liquids are released and remain at ambient temperatures.

It is important to note that heating toxic liquids as a result of fire or other chemical reactions can dramatically increase release rates and downwind impact distances. Highly reactive liquids, such as strong acids, react with many substances while generating heat, which increases evaporative rates. Chemical reaction of liquids with substances in the environment upon release can also produce toxic gases as products of reaction. Under certain conditions, liquids can also be introduced into the environment as fine aerosols, which behave much like gases.

**Solids:** Finely divided solids can be released by explosion or other physical means and may disperse much like gases. Like liquids, solids can also react with other substances to release toxic gases.

- 2) **Causes of Releases:** Causes of chemical accidents in Alaska are expected to mirror causes reflected in nationwide records. In a general sense, causes of most chemical accidents fall into three primary (but not entirely distinct) categories: human error, fire, and natural disasters.

**Human Error:** The single greatest cause of chemical releases reflected in nationwide records is, directly or indirectly, human error. Inadequate training, lapses in judgment, and inadequate number of personnel appear repeatedly in the records as the cause of chemical accidents. The statistic suggests that the frequency of accidental releases is directly proportional to the level of human judgment and opportunity for mistakes. There is every reason to expect that the prevalence of human error as a cause of chemical accidents will apply in Alaska.

**Fire:** Fire is also a common, and in some ways a problematic, cause of releases. In closed systems, such as pressure vessels or refrigeration systems, increases in temperatures cause increases in internal pressure. To reduce the risk of explosion, most closed systems are equipped with some form of pressure relief device that will vent all or some of the system contents in the event of over-pressurization. Extreme temperatures associated with fires can be expected to result in the release of gases via these pressure relief devices.

For liquids, heat produced by fires increases vapor pressures and the rate at which liquids are released into the air. Fires can also produce or accelerate chemical reactions whereby toxic substances are created

and dispersed. It is important to note that most plume models do not simulate the effects of fire and other chemical reactions.

One characteristic of fire, on the other hand, tends to reduce the effects of fire-associated releases. Produced heat forms strong vertical air currents that disperse emissions vertically, as opposed to horizontally along the ground surface.

**Natural Disaster:** Other causes of accidental chemical releases include natural phenomena such as earthquakes, and floods. With its active seismic zones, earthquakes may be a more likely cause of chemical releases in Alaska. Natural disasters can result in situations that exceed those contemplated in normal emergency planning.

- 3) **Accident Frequencies:** The expected frequency of accidental chemical releases on a unit basis will be higher in Alaska than on a national basis. Factors that will tend to increase the likelihood of a release include extreme environmental conditions, improper training, and lack of regulatory oversight.

**Fixed Facilities:** The Handbook of Chemical Hazard Analysis Procedures (Federal Emergency Management Agency - FEMA et al, 1990) presents an approach for estimating the likelihood of releases from facilities. In formulating the approach, FEMA suggests that the frequency of significant accidents is largely a function of the number of containers, and whether the containers are in use or in storage: Primarily due to the potential for fire damage, FEMA concludes that the frequency of accidents is ten times greater for containers in warehouses and other storage facilities than for containers at medium size industrial facilities such as water treatment plants. FEMA also concludes that accident frequency varies directly with the number of containers – the more containers, the higher the likelihood of an accident.

The handbook suggests a failure rate for water treatment plants and other medium size industrial users of  $1 \times 10^{-4}$  failures per storage tank or pressure vessel per year. For warehouses and other storage facilities, the handbook suggests a failure rate of  $1 \times 10^{-3}$  failures per storage tank or pressure vessel per year. While valve and piping leaks are far more common than container failures, such operational leaks are often detected and are often of a magnitude that does not pose a threat beyond the facility and immediate working environment. As a result of the limited number of containers present at individual facilities in Alaska, the expected frequency of container failure at any single facility should never exceed  $1 \times 10^{-2}$  per year.

**Bulk Marine Transport:** The Handbook of Chemical Hazard Analysis Procedures (FEMA et al, 1990) states that marine transportation has the lowest accident rate per ton-mile and the lowest number of accidents of the various modes of transportation. The large energies involved when accidents do occur, however, can result in large cargo losses. The handbook estimates spill frequency for bulk marine transport based on the likelihood of vessel accidents per mile traveled or per port call. Suggested accident frequencies vary from  $1 \times 10^{-3}$  per mile for collisions and groundings in harbors and bays to  $5 \times 10^{-6}$  per mile for groundings on lakes, rivers and intercoastal waterways. Of the accidents involving single-hulled vessels, 25 percent can be expected to result in releases, and of these, 30 percent can be expected to result in the loss of 100 percent of one tank or compartment. This suggests large-scale releases may occur at a frequency of  $7.5 \times 10^{-5}$  to  $3.75 \times 10^{-7}$  per mile traveled.

**Bulk Rail Transport:** The Handbook of Chemical Hazard Analysis Procedures (FEMA et al, 1990) estimates spill frequency for bulk rail transport based on the likelihood of accidents per rail car-mile. The handbook suggests a frequency for mainline accidents of  $6 \times 10^{-7}$  per car-mile and a frequency for yard accidents of  $3 \times 10^{-6}$  per car-mile. Of the accidents, the handbook suggests that 30 percent can be expected to result

in complete loss of cargo. This yields a frequency for large-scale releases from mainline accidents of  $1.8 \times 10^{-7}$  per car-mile and  $9 \times 10^{-7}$  per car-mile for releases from accidents in rail yards.

**Bulk Truck Transport:** The Handbook of Chemical Hazard Analysis Procedures (FEMA et al, 1990) estimates spill frequency for bulk truck transport based on the likelihood of truck accidents per mile traveled, and the percentage of those accidents that result in a release of some or all of the contents. The handbook suggests use of an average accident rate of  $2 \times 10^{-6}$  accidents per mile for trucks carrying bulk quantities of hazardous materials. The method suggests that accidents result in spills 20 percent of the time, and of those, 20 percent will result in release of the entire cargo. Considering all factors, the handbook suggests that accidents will result in release of the entire contents at a rate of  $8 \times 10^{-8}$  per mile traveled per year.

- 4) **Release Consequences:** While releases of chemical substances can certainly affect the environment, release consequences are most often evaluated in terms of human injury and loss of life. If this standard is used, it is understood that the most severe consequences are associated with releases in highly populated areas. With a scattered and largely rural population, the potential for catastrophic consequences - for example, affecting over 1,000 persons - in Alaska is confined to a handful of population centers. On the other hand, release consequences evaluated in terms of the percentage of a community's population impacted and the degree of impact could still be great in many Alaskan communities.
- 5) **Risk:** Risk is normally considered a function of both the likelihood of a release, and the severity of the consequences. Risk is greatest where a release is most likely to occur and the consequences would be most severe - the least where releases are highly improbable, or even if one were to occur, impacts would be minor. In a general sense, chemical risk in Alaska is not nearly as high as many parts of the nation. Nevertheless, many Alaskan communities are faced with some degree of chemical risk.

## 7200 – OPERATIONS

### 7210 – Hazmat Response

All hazardous material (hazmat) releases in excess of the reportable quantity must be reported by the responsible party to the National Response Center (NRC). Any release, regardless of amount, is required to be reported to the Alaska Department of Environmental Conservation (ADEC). Upon notification of a release, the NRC shall promptly notify the appropriate Federal On-Scene Coordinator (FOSC). The FOSC shall contact the ADEC State On-Scene Coordinator (SOSC). If ADEC receives notification first, the SOSC shall notify the FOSC promptly. The FOSC and SOSC will relay the notification to local communities, resource agencies, medical facilities, and others as necessary and begin coordination with a Local On-Scene Coordinator (LOSC), if available, if the incident poses an immediate threat to public health and safety.

***The community's local on-scene coordinator (LOSC) is in command and control until he or she determines that there is no longer an imminent threat to public safety.*** The LOSC can at any time request higher authority to assume command and control of an incident. Local emergency plans should be consulted for any specific directions or guidelines. The local fire department and/or Local Emergency Planning Committee (LEPC) should have the most current records on local storage of hazmat in quantities large enough to meet federal reporting requirements.

### Recognition

To deal with a hazmat release safely, it is essential to recognize the chemical or physical hazards that may affect response personnel. Chemical and physical hazards may be confronted by emergency response personnel when responding to a hazardous material incident. Chemical hazards include biological, radioactive, toxic, flammable, and reactive hazards. Physical hazards include slips; trips and falls; compressed gases; materials handling; thermal, electrical, and noise hazards; and confined spaces.

To help determine these hazards, it is important to identify the properties of the released material, including characteristics such as flammability, radioactivity, corrosiveness, toxicity, and/or other properties that classify them as hazardous. For any particular hazardous category, the degree of hazard varies depending on the substance.

The degree of hazard is a relative measure of how hazardous a substance may be. For example, the Immediately Dangerous to Life and Health (IDLH) concentration of butyl acetate in air is 10,000 parts per million (ppm); the IDLH for tetrachloroethane is 150 ppm. Tetrachloroethane is therefore far more toxic (has a higher degree of hazard) when inhaled in low concentration than butyl acetate. Vapors from butyl acetate, however, have a higher degree of explosive hazard than tetrachloroethane vapors, which are not explosive.

The hazardous properties and degree of hazard for a substance can be determined using reference materials. Chemical properties and the health hazards associated with the various materials transported in the Arctic and Western Alaska Area can be found in the United States USCG (USCG) Chemical Hazards Response Information System (CHRIS) Manual, the United States Department of Transportation (DOT) Emergency Response Guidebook (current edition), and Computer-Aided Management of Emergency Operations (CAMEO) computer programs. Industry experts can be consulted as well. An excellent resource is the CHEMTREC 24-hour information number, 1-800-424-9300, supported by the Chemical Manufacturers Association. Additional references are provided below.

Although print and online sources can provide information about a substance's environmental behavior, additional field data will likely be required to fully characterize it. Most frequently, air monitoring and sampling are needed to verify and identify the presence of hazmat, calculate concentrations, and confirm dispersion patterns.

## Evaluation

To properly evaluate a hazmat release, the incident must be characterized. Incident characterization is the process of positively identifying the substance(s) involved and evaluating the actual or potential public health and environmental impacts. This is generally a two-phase process, comprising an initial characterization followed by a more comprehensive characterization.

**1. Initial Characterization:** The initial characterization is based on information that is readily available or can be obtained rapidly to determine what hazards exist and if immediate protective measures are necessary. During this initial phase, a number of key decisions must be made regarding:

- Imminent or potential threat to public health
- Imminent or potential threat to the environment
- Immediate need for protective actions to prevent or reduce the impact
- Protection of the health and safety of response personnel

If the incident is not immediately dangerous to human life or sensitive environments, more time is available to evaluate the hazards, design plans for cleanup, and establish safety requirements for response personnel. Information for characterizing the hazards can be obtained from on-scene intelligence

(records, placards, eyewitnesses, etc.), direct reading of instruments, and sampling. Depending on the nature of the incident and the amount of time available, various combinations of these information-gathering methods may be used. The following outline describes one approach to collecting the data needed to evaluate a hazmat incident's impact.

- Attempt to gather as much information as possible, such as:
  - Nature and exact location of the incident
  - Date and time of occurrence
  - Hazardous substances involved and their physical/chemical properties
  - Present status of the incident
  - Potential pathways of dispersion
  - Habitation - population at risk
  - Environmentally sensitive areas - endangered species, delicate ecosystems
  - Economically sensitive areas - industrial, agricultural
  - Accessibility by air, roads, and waterways
  - Current weather and forecast (next 24 to 48 hours)
  - Aerial photographs/video when possible
  - A general layout and mapping of the site
  - Available communications
- Off-site reconnaissance (that can be conducted in Level D Personal Protective Equipment (PPE), per OSHA and EPA guidance) should be the primary inspection method for initial site characterization when the hazards are largely unknown or there is no urgent need to enter the site. Off-site reconnaissance consists of visual observations and monitoring for atmospheric hazards near the site. Collecting of off-site samples may help identify substance migration or indicate on-site conditions. Off-site reconnaissance would include:
  - Monitoring ambient air with direct-reading instruments for:
    - Organic and inorganic vapors, gases, and particulates
    - Oxygen deficiency
    - Specific materials, if known
    - Combustible gases and radiation
  - Identifying placards, labels, or markings on containers or vehicles
  - Noting the configuration of containers and trailers
  - Noting the types and numbers of containers, trailers, buildings, and impoundments
  - Identifying any leachate or runoff
  - Looking for biological indicators - dead vegetation, animals, insects or fish
  - Noting any unusual odors or conditions
  - Observing any vapors, clouds, or suspicious substances
  - Taking off-site samples of air, surface water, ground water (wells), drinking water, site runoff, and soil
  - Reviewing the Dangerous Cargo Manifest
  - Conducting interviews with workers, witnesses, observers, or inhabitants
- An on-site survey (conducted in a minimum of Level B PPE, per OSHA and EPA guidance until hazards can be determined) may be necessary if a more thorough evaluation of hazards is required. On-site surveys require personnel to enter the restricted or hot zone of the site. Prior to any personnel conducting an on-site survey, an entry plan addressing what will be initially accomplished and prescribing the procedures to protect the health and safety of response personnel will be developed. On-site inspection and information gathering would include:
  - Monitoring ambient air with direct-reading instruments for:

- Organic and inorganic vapors, gases, and particulates
- Oxygen deficiency
- Specific materials, if known
- Combustible gases and radiation
- Observing containers, impoundments, or other storage systems and noting:
  - Numbers, types, and quantities of materials
  - Condition of storage systems (state of repair, deterioration, etc.)
  - Container configuration or shape of tank cars, trailers, etc.
  - Labels, marking, identification tags, or other indicators of material
  - Leaks or discharges from containers, tanks, ponds, vehicles, etc.
- Noting physical condition of material:
  - Solids, liquids, gases
  - Color
  - Behavior (foaming, vaporizing, corroding, etc.)
- Determining potential pathways of dispersion - air, surface water, ground water, land surface, biological routes
- Taking on-site samples of storage containers, air, surface water, ground water (wells), drinking water, site runoff, and soil.

**2. Comprehensive Characterization:** Comprehensive characterization is the second phase, and may not be needed in all responses. It is a more methodical investigation to enhance, refine, and enlarge the information base developed during the initial characterization. This phase provides more complete information for characterizing the hazards associated with an incident. As a continuously operating program, the second phase also reflects any environmental changes resulting from response activities.

Information obtained off site and during the initial site, entries can be sufficient to thoroughly identify and assess the human and environmental effects of an incident. If not, an environmental surveillance program needs to be implemented. This program collects the same type of information gathered during the preliminary inspection, but more detailed and extensive. For example, if the first phase involved the collection of one or two groundwater samples, the second phase would conduct a broad and intensive groundwater survey over a long period.

Results from preliminary inspections provide a screening mechanism for a more complete environmental surveillance program to determine the full extent of contamination. Since mitigation and remedial measures may cause changes in the original conditions, a continual surveillance program can be used to identify and track these fluctuations or ramifications.

### **Evacuation**

Neither the USCG nor the EPA has the authority to order an evacuation of facilities or communities in the event of a hazmat release; this authority lies with local or state entities. However, evacuation should be strongly recommended to local civil authorities (police, fire departments, etc.) whenever a hazardous release poses a threat to surrounding personnel. In the event of such a release, the area should be isolated for at least 100 meters in all directions until the material is identified. Only trained and properly equipped personnel should be allowed access.

To guide evacuations, the DOT Emergency Response Guidebook includes “Table 1: Initial Isolation and Protective Action Distances.” Evacuation should always begin with people in downwind and in low-lying areas. Continual reassessment is necessary to account for changes in weather and wind, rate of release,

etc. CAMEO should be used to provide an air plume trajectory model for downwind toxic plume distances. Again, constant reassessment is required.

Issues concerning disaster assistance for people and organizations in evacuated areas should be referred to the Alaska Department of Military and Veterans Affairs (DMVA) Division of Homeland Security and Emergency Management.

### **Direction and Site/Entry Control**

The purpose of site control is to minimize potential contamination of emergency response personnel, protect the public from any hazards, contain and reduce the extent of contamination to the environment, and prevent unlawful entry onto the site that may result in an additional release of material, destruction of evidence, or prolonging of the cleanup effort. The degree of site control necessary depends on site characteristics, site size, and the surrounding community.

Several site control procedures should be implemented to reduce potential exposure and ensure an effective, rapid cleanup, including:

- Secure site, and establish entry control points
- Compile a site map
- Prepare the site for subsequent activities
- Establish work zones
- Use the buddy system when entering
- Establish and strictly enforce decontamination procedures
- Establish site security measures
- Set up communications networks
- Enforce safe work practices

For complete guidance on Direction and Site Entry/Control, Reference the NIOSH/OSHA/USCG/EPA Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities (Publication No. 85-115).

### **Command and Control**

The LOSC can at any time request higher authority to assume command and control of an incident. All applicable local emergency plans should be consulted. After the LOSC, together with the FOsc and SOsc, has determined that public safety is not at risk, then the Unified Command response organization will assume command and control of the incident.

Government response organization in the State of Alaska is based on the Unified Command structure of the Incident Command System (ICS), which is outlined in [Section 1400](#) of this document and the Alaska Regional Contingency Plan.

### **Communications**

A communications plan for all sections of the ICS will be established by the Incident Commander.

At this time, a pre-established generic communications plan accounting for the various police, fire, federal, state, and local frequencies has not been established.

### **Warning Systems & Emergency Public Notification**

Three separate systems for broadcast of emergency messages are available to the Alaska Regional Response Team, FOSC, and SOSC: the National Oceanic and Atmospheric Administration (NOAA) Weather Radio System, the State of Alaska Emergency Alert System, and the National Warning Systems. The LOSC or the local emergency services should activate any system available in their community (e.g., community alert system).

**Health and Medical Services** - For local hospital and clinic information, Reference the [Emergency Medical Services](#) section or the [Community Profiles](#).

### **7210.1 – Radiological Response**

**General:** The potential for a significant nuclear-related accident in the State of Alaska is remote. There are no active nuclear reactors in the State of Alaska and the quantities of nuclear materials transported within the state are insignificant in comparison to nuclear waste/cargo shipments in the Lower 48 states. However, Alaska's proximity to nuclear facilities (e.g., power plants, waste storage sites, and processing plants) in eastern Russia and seasonal weather patterns that could bring fallout over the state warrant concern, as well as preparedness on the U.S. side. Most of the Russian facilities are substandard in construction and have had a history of reported and unreported releases.

Two basic situations may occur following a radiological accident. In the case of a major catastrophic event with serious impact to the State of Alaska, the Governor may declare a disaster emergency, the State Emergency Response Plan would be activated, and the Alaska Department of Military and Veterans Affairs would be the lead agency. For non-declared emergencies, the Alaska Department of Environmental Conservation (ADEC) more than likely would serve as the lead agency under their hazardous materials response charter.

The National Response Framework (NRF), Nuclear/Radiological Incident Annex details the responsibilities of coordinating Federal agencies for nuclear/radiological incidents. These coordinating agencies include:

- Department of Defense (DOD) or Department of Energy (DOE), as appropriate, for incidents involving nuclear/radiological materials or facilities owned or operated by DOD or DOE; or for incidents involving a nuclear weapon, special nuclear material, and/or classified components under DOD or DOE custody.
- DHS, generally through Customs and Border Protection (CBP), for incidents involving the inadvertent import of radioactive materials as well as any other incidents where radioactive material is detected at borders.
- EPA or DHS/USCG, as appropriate, for environmental response and cleanup for incidents not otherwise covered above.
- DHS for all deliberate attacks involving nuclear/radiological facilities or materials, including radiation dispersal devices and improvised nuclear devices.

Basic Responsibilities of State and Federal Agencies:

1. Federal agency tasking is contained in the National Response Framework.
2. The Alaska Department of Military and Veterans Affairs (through the Division of Homeland Security and Emergency Management) will:
  - Implement the State Emergency Response Plan, if applicable.
  - \*Provide the designated State Coordinating Officer.
  - Receive communications from federal, state and local agencies.

- \*Provide updates to the Governor and federal, state and local agencies through Situation Reports (SitReps).
- \*Provide a State Area Commander and lead staff for the State Emergency Coordination Center.
- Facilitate release of health advisory information and recommended population protection measures.
- \*Coordinate area evacuation if the situation warrants.

\*Basic tasks under a declared disaster situation.

3. The Alaska Department of Environmental Conservation will:
  - Set up/participate in the Unified Command (non-disasters) and provide the State On-Scene Coordinator (SOSC).
  - Coordinate health advisories with the Alaska Department of Health and Social Services (ADHSS).
  - Coordinate and verify accuracy of actual and forecasted radiological contamination plume locations thru NOAA's National Weather Service satellite imagery and the University of Alaska's Geophysical Institute at Fairbanks.
  - Provide ADEC Air Quality staff and response team assistance, as requested by the State Coordinating Officer or the ADEC SOSC.
  - Alert the EPA Alaska Operations Office (if not previously alerted) and local communities that may be at risk. Coordinate response actions.
  - Determine areas within the State that are likely to receive airborne radiological contamination and establish a radiation-monitoring network. As a minimum:
    - Coordinate with EPA and determine local sample screening and analysis capability to expedite turnaround of sampling results.
    - Coordinate with the US Air Force, US Army, and US Navy for Department of Defense resources in Alaska and with the USCG and other federal agencies for their resources for establishing a monitoring network and data exchange.
4. The Alaska Department of Health and Social Services will:
  - Develop appropriate protective action guidelines for response to radiological releases. EPA-developed federal protective action guidelines may be used if deemed appropriate for the State of Alaska.
  - Coordinate health advisories with ADEC prior to release over statewide media networks.
  - Alert the US Food and Drug Administration and the US Nuclear Regulatory Commission of the potential for radiological contamination impacting the State of Alaska.
  - Advise the Unified Command on the potential health hazards resulting from the deposition of radiological contamination.
  - Maintain contact with rural health facilities and provide them with updated status reports.
  - Provide a representative to the Unified Command structure.
5. The Alaska Department of Labor and Workforce Development will:
  - Alert federal Occupational Safety and Health Administration (OSHA) officials.
  - Coordinate with ADHSS in determining OSHA standards for radiation exposure to emergency response personnel.

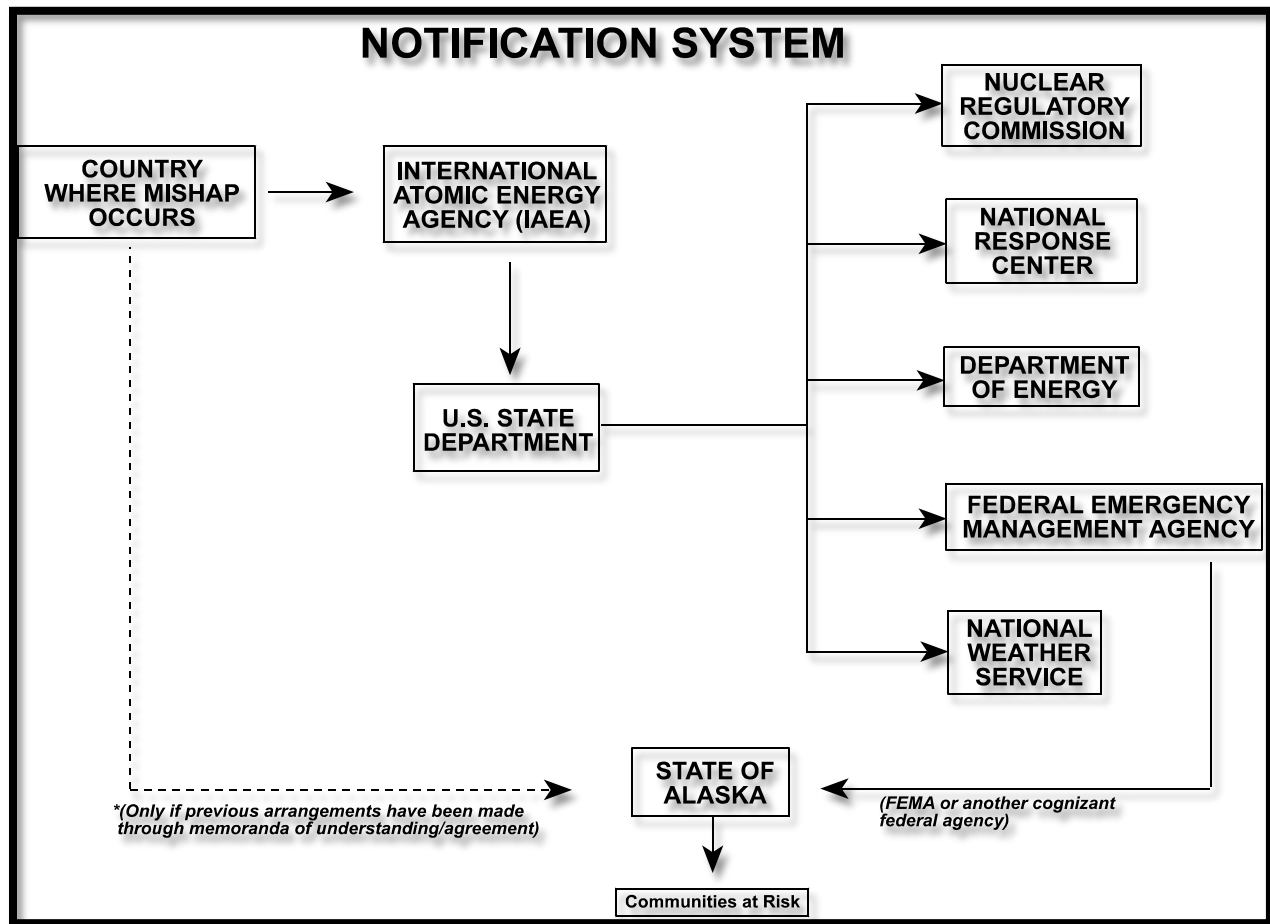

6. The Alaska Department of Fish and Game will:

- In conjunction with the U.S. Department of Agriculture and other federal agencies, determine the impact of radiological hazards on fish and wildlife in the affected area.
- Advise the general public on any restrictions to commercial, sport, or subsistence fishing and hunting as a result of potential health hazards (from consumption of contaminated fish and wildlife).

**NOTIFICATION PROCEDURES:** Immediate notification of a radiological incident is critical to develop and implement the proper response strategy to protect the general populace. While existing international protocols outline a formal notification system through the International Atomic Energy Agency (IAEA), direct communication with the affected country will provide immediate information on the release. The existing lines of communication are described below. Additionally, the figure below provides a schematic flow diagram for notification.

1. **International Notification:** Currently, in the event of nuclear releases, which may threaten the United States, the U.S. State Department could be notified by the International Atomic Energy Agency (IAEA) **and/or** the country where the release has occurred.
2. **Federal Notification:** The U.S. State Department notifies the Nuclear Regulatory Commission (NRC), which, in turn, notifies its regional offices, the National Response Center, the Department of Energy, Federal Emergency Management Agency, National Weather Service, and the State of Alaska.
3. **State Notification:** Within the State of Alaska, the Division of Homeland Security and Emergency Management (DHSEM) would receive the initial call from federal agencies. Upon receiving notification, DHSEM will notify the Governor and the Alaska Departments of Environmental Conservation and Health and Social Services. Additional notification responsibilities are also indicated under basic tasks for each State agency.
4. **Local Notification:** The State agency in charge of the radiological response will provide immediate notification to local elected officials for those communities, which may be at risk from the radiological hazard. In addition, Reference additional notification responsibilities indicated under basic tasks for each State agency.

Figure 7-1: Radiological Release Notification

## 7220 – Responsible Party Action

**Discovery and Notification:** Any person in charge of a vessel or a facility shall report releases of hazmat in excess of the reportable quantity as defined in Table 1 of 49 CFR 172.101 to the NRC's 24-hour telephone number, 1-800-424-8802, in accordance with the NCP. Any release, regardless of the amount, is required to be reported to the State of Alaska. This notification can be accomplished by contacting the ADEC either through the Central Area Response Team at 269-3063 or through the 24-hour telephone number at 1-800-478-9300.

If direct reporting to the NRC is not immediately practicable, reports will be made to the Captain of the Port (COTP) Western Alaska at 24-hour telephone number 428-4100. All such reports shall be promptly relayed to the NRC.

In any event, **the person in charge of the vessel, vehicle, or facility involved in a hazardous material release shall notify the NRC and the State of Alaska as soon as possible.**

As much information as possible shall be reported, including, but not limited to, the following:

- Location of the release
- Type(s) of material(s) released, including any pertinent SDS data
- Estimated quantity of material released

- Possible source of the release
- Date and time of the release
- Population and/or environment at risk

**Removal Action:** The responsible party shall, to the fullest extent possible, perform promptly the necessary removal action to the satisfaction of the pre-designated FOSC, SOSC, and LOSC or local emergency services.

Regardless of whether or not a cleanup will be conducted, the responsible party shall cooperate fully with all federal, state, and local agencies to ensure that the incident is handled in a safe, proper manner.

### **7230 – State Action**

**Authority:** The ADEC is mandated by statute to respond promptly to a discharge of oil or a hazardous substance (Alaska Statute [AS] 46.80.130). Additionally, the ADEC may contract with a professional emergency contractor or municipality to meet response requirements and/or establish and maintain a containment and cleanup capability (i.e., personnel, equipment, and supplies) (AS 46.09.040).

**Response Policy:** The ADEC is currently operating in accordance with an August 1992 policy decision that precludes ADEC personnel from responding to situations that require Level A/B protection. ADEC personnel are prohibited from responding with or using personal protective equipment beyond the Level C protection category (as defined in EPA standards).

**State Response Capabilities:** The ADEC has entered into community response agreements with the Municipality of Anchorage, Kenai Peninsula Borough, Matanuska-Susitna Borough, and the Cities of Homer, Kenai, and Seldovia.

The ADEC also coordinates with the Statewide Hazardous Materials Response Team, which consists of the local and regional Level A Entry capable hazmat response teams. These teams include the hazmat teams from the Municipality of Anchorage, Fairbanks North Star Borough, the City of Kodiak, the City and Borough of Juneau, and the City of Ketchikan, along with the Alaska National Guard 103rd Civil Support Team (CST) and the EPA response team (Superfund Technical Assessment and Response Team).

In the event of a hazmat release requiring immediate response, the ADEC's pre-designated SOSC may request support from any of the hazmat response teams. These teams maintain a Level A entry capability and can respond beyond their jurisdictional boundaries at the request of the SOSC. ADEC, in turn, will reimburse the community for expenses incurred by the team during the response. The teams are to be used strictly for emergency response operations. Once the immediate hazard is dealt with, the teams will be released to return to their home stations. Post-response recovery operations will be handled by the responsible party (if known) or through ADEC response team contractors or federal contractors.

The Level A response capability refers to the level of protection provided to emergency responders. Level A is the highest level of protection and provides skin and respiratory protection for Hazmat responders through the wearing of a vapor-tight protection garment and breathing apparatus. This level of protection is followed by Levels B, C, and D (with D providing the least amount of protection, usually requiring only specific work clothing and eye [splash] protection).

Another state asset is the 103rd CST, based at Joint Base Elmendorf Richardson, Alaska. The 103rd CST can be requested through the ADEC or DMVA's Division of Homeland Security and Emergency Management, State Emergency Operations Center (428-7100 or 1-888-462-7100). This team's primary focus is weapons of mass destruction, including chemical and biological warfare agents and toxic industrial chemicals. The 103rd CST maintains Level A entry capability and a wide variety of detection instruments and support equipment. The team can be used in an advisory role for hazard modeling or medical assessment and in a primary or an assist mode to perform entries alone or in conjunction with other first responders.

## **7240 – Federal Action**

**Authority:** Section 311 of the Federal Water Pollution Control Act and the Comprehensive Environmental Response, Compensation and Liability Act of 1980 are the principal authorities for federal response to discharges of oil and releases of hazardous substances. The procedures and standards for conducting responses are contained in the NCP (40 CFR 300). Under the NCP and the Regional Contingency Plan, each USCG COTP for coastal zones, or EPA representative for inland zones, coordinates federal activities on scene either as the pre-designated FOSC or as the first federal official in the absence of the pre-designated FOSC. The FOSC objective is to ensure rapid, efficient mitigation of actual or threatened pollution releases or discharges.

**Jurisdiction:** In accordance with the NCP, the USCG COTP for Western Alaska (Commanding Officer, Sector Anchorage) is identified as the pre-designated FOSC for the coastal zone. The FOSC will respond to hazardous substance releases, or threats of release, occurring in the coastal or inland zones and not involving Department of Defense vessels or facilities, which originate from:

- Vessels and vehicles (as well as other modes of transportation, e.g., railroad).
- Facilities, other than hazardous waste management facilities, when the release requires immediate action to prevent risk of harm to human life, health, or the environment.
- Hazardous waste management facilities, or illegal disposal areas, when the FOSC determines emergency containment or other immediate removal actions are necessary prior to the arrival of the EPA FOSC.

For all shore side incidents in the coastal zone, once the immediate threat to human life, health, or the environment has been abated and the character of the response changes to a long-term cleanup or site remediation, the FOSC's responsibilities will be transferred from the USCG COTP to a designated EPA official.

**Response Policy:** The USCG will follow the policy guidance contained in COMDTINST M16465.30, "Policy Guidance for Response to Hazardous Chemical Releases," and the Marine Safety Manual, Volume VI, Chapter 7 when responding to a hazardous chemical release. [The USCG Incident Management Handbook](#) also provides guidelines for responding to a hazardous substance release.

The USCG and other federal agencies in Alaska will maintain a "conservative" Level D response capability level. "Conservative" response consists of recommending evacuation of the affected area and maintaining a safe perimeter while attempting to positively identify the pollutant and outlining a clear course of action. Federal personnel, with the exception of specialized teams (e.g., the National Strike Force, the Pacific Strike Team, and the EPA Environmental Response Team and Superfund Technical Assessment and Response Team), will not enter a hazardous environment. This response posture is appropriate due to

insufficient numbers of trained or equipped personnel to allow a safe and proper entry into a hazardous environment and the low risk of a chemical release in the area.

Level D protection is primarily work uniform/coveralls, safety boots, safety goggles and a hard hat. This provides minimal protection. Level D must not be worn for "entry" into any hazmat situation. It does NOT provide protection from chemicals. Level D protection strictly applies to non-hazardous environments (e.g., Command Post, Cold Zone, etc.).

In situations requiring an entry into a hazardous environment, federal agencies will rely on the capabilities of the USCG Pacific Strike Team, EPA response teams, state and local hazmat response teams, if available, and industry or commercial resources.

In implementing this conservative response posture, the COTP for Western Alaska will carry out all the FOSC functions not requiring entry of unit personnel into a hazardous environment. These functions include:

- Conducting preliminary assessment of the incident.
- Carrying out COTP measures such as restricting access to affected areas, controlling marine traffic (safety zones), notifying affected agencies, coordinating with state and local agencies, and assisting as resources permit.
- Conducting local contingency planning.
- Identifying responsible parties and informing them of their liability for removal costs.
- Carrying out "first aid" mitigation if the situation warrants and capability exists.
- Monitoring cleanup activities.

The CAMEO software suite will be an important part of any chemical release incident. This set of software includes CAMEOfm, CAMEO Chemicals, Areal Locations of Hazardous Atmospheres (ALOHA), and Mapping Application for Response, Planning, and Local Operational Tactics (MARPLOT). Together, the CAMEOfm chemical database and CAMEO Chemicals chemical response information datasheets and reactivity prediction tool provide a rapid means of identifying chemicals and their associated hazards. ALOHA, air-modeling program, part of CAMEO, provides a rapid means of developing a downwind hazard evaluation. MARPLOT is an easy-to-use geographic information system (GIS) interface. The NOAA Scientific Support Coordinator will be the primary individual responsible for operating the CAMEO programs during a hazardous chemical release for the FOSC. Local fire departments and the EPA also maintain CAMEO to assist in their response efforts. Programs for the ALOHA model need to be frequently updated to account for changing wind and weather conditions, source strength, and other variable conditions. These software applications are available for free download at <https://www.epa.gov/cameo>.

## **7250 – Transportation**

Reference the [Statewide Hazmat Commodity Flow Study](#) for information on transportation of extremely hazardous substances, hazardous substances and oil/petroleum products in Alaska, to include an explanation of the United Nations Hazardous Materials Classification system.

## **7300 – HAZARDOUS SUBSTANCES AND PRODUCTS IN ARCTIC AND WESTERN ALASKA**

This section profiles specific EHSs in Alaska - the substances and their characteristics, the facilities that use or store them, their transportation, the risks they pose, and the capability to respond to large-scale releases.

Alaska is fortunate in that a limited number of EHS are known to be present in the state, and of the limited number identified only a few are prevalent. The top five EHS substances (with the addition of hydrogen sulfide) are listed below, generally in order of the total amounts thought to be present in Alaska, from greatest to least:

- Hydrogen sulfide gas associated with crude oil
- Anhydrous ammonia as a compressed gas and as a refrigerated liquid
- Sulfuric acid as a liquid and in solution
- Formaldehyde, formaldehyde solution, and urea-formaldehyde solution
- Sodium cyanide as a solid and in solution
- Chlorine as a compressed gas

**Chemical Properties:** Under certain conditions, all of the EHS present in substantial quantities in Alaska pose an acute inhalable toxic threat. Properties of some of the more common chemicals are discussed in the following paragraphs.

- **Hydrogen sulfide** gas is a colorless gas with an odor of rotten eggs. It is heavier than air and highly flammable. It forms explosive mixtures with air and a number of other substances. The gas is a central nervous system depressant. Inhalation of high concentrations for short periods can cause death. Even exposure to small concentrations for short periods can result in permanent injury or death.
- **Anhydrous ammonia** is a colorless gas with a characteristic odor. The term "anhydrous" is used to distinguish the pure form of the compound from solutions of ammonia in water. Like chlorine, anhydrous ammonia is not explosive, but will support combustion. It readily dissolves in water to form an aqua ammonia solution. Anhydrous ammonia is considerably lighter than air and will rise in dry air. As a practical matter, however, anhydrous ammonia immediately reacts with any humidity in the air and will often behave as a heavier gas. The chemical reacts with and corrodes copper, zinc and many alloys.

Anhydrous ammonia affects the body in much the same way as chlorine gas. Like chlorine, anhydrous ammonia gas is primarily a respiratory toxicant. In sufficient concentrations, the gas affects the mucous membranes, the respiratory system and the skin. In high concentrations, it can cause convulsive coughing, difficult and painful breathing, and death. Anhydrous ammonia will cause burns if it comes in contact with skin or eyes. Response to anhydrous ammonia releases may require Level A personal protective equipment.

Significant amounts of anhydrous ammonia are used in Alaska as a refrigerant, most often associated with cold storage of seafood. Historically, the chemical has been present in very large quantities at a single urea production facility on the Kenai Peninsula. It is nearly always found in transport and in temporary storage as a liquefied compressed gas in 100-, 150- and 2,000-lb pressure vessels. All pressure vessels are equipped with fusible metal pressure relief devices to relieve pressure and prevent rupture in the case of fire or other exposure to high temperatures.

While packaging for transport and temporary storage is nearly uniform, and similar to that for chlorine, anhydrous ammonia is often found in much larger volumes in the piping and receivers

of refrigeration systems. There are numerous refrigeration systems in Alaska where the amount of anhydrous ammonia present exceeds ten thousand pounds.

- **Sulfuric acid** is a colorless, oily liquid. It is highly reactive and readily soluble in water with release of heat. Both the liquid and solutions will cause burns if allowed to come in contact with skin or eyes. Fumes are highly toxic, and heat as a result of fire or other chemical reaction can significantly increase emissions. Reaction of the acid with a variety of substances can also produce other toxic gases.

While sulfuric acid is a versatile and common industrial chemical, in Alaska sulfuric acid solution is most often found in use as a battery electrolyte, as part of the water treatment process for industrial boilers, as part of the cleaning process for fish meal plants, and in ore milling processes. Sulfuric acid solution is found across the state, but nearly always in association with larger industrial facilities or at remote locations for power generation.

- **Formaldehyde** at normal temperatures is a gas, but in Alaska, it is found in bulk only as an industrial solution. Toxic formaldehyde gas readily vaporizes from solution. The gas is denser than air and will disperse as a heavy gas. Addition of heat will increase the rate at which formaldehyde gas is released from solution. While formaldehyde solution has a number of uses, it is used in bulk in Alaska primarily as a biocide, and occurs at fish hatcheries. It is most frequently found as a 37 percent solution in water. The gas is highly toxic and can cause adverse health effects at small concentrations.
- **Sodium Cyanide** is principally used by the mining industry to extract gold from gold bearing ore using the carbon-in-leach and carbon-in-pulp processes. These processes enable commercial recovery of gold at very low concentrations. It is normally shipped and stored as a white solid, and is readily soluble in water and other solvents including alcohol. The chemical is not combustible but forms flammable gas on contact with water or damp air, and emits irritating or toxic fumes (or gases) in a fire. The chemical can cause eye irritation, and can be absorbed through the skin. It also presents an inhalation and ingestion hazard.
- **Chlorine** is a greenish-yellow gas with a characteristic odor. It is neither explosive nor flammable, but is a strong oxidizing agent and will support combustion. It is only slightly soluble in water. At about two and one-half times the density of air, it will spread as a dense gas, flowing downhill under the influence of gravity. The chemical has a strong affinity for many substances and usually will produce heat on reacting. While dry chlorine is non-corrosive at ordinary temperatures, it becomes extremely corrosive in the presence of moisture.

Significant amounts of chlorine are used in Alaska for water and wastewater treatment. It is nearly always found in use, in transport and in storage as a liquefied compressed gas in 100-, 150- and 2,000-lb pressure vessels. All vessels are equipped with fusible metal pressure-relief devices to relieve pressure and prevent rupture in the case of fire or other exposure to high temperatures.

Chlorine gas is primarily a respiratory toxicant. In sufficient concentrations, the gas affects mucous membranes, the respiratory system and the skin. In high concentrations, it can permanently damage the lungs and can cause death by suffocation. Liquid chlorine will cause burns if it comes in contact with skin or eyes. Response to chlorine releases may require Level A

personal protective equipment. Chlorine can be disposed of by passing it through an alkali (caustic soda or soda ash) solution.

The State of Alaska Tier II Database can be accessed electronically at the following link: <https://ready.alaska.gov/tierII/>

This next section provides general information on the location of extremely hazardous substances and other hazardous substances within the Arctic and Western Alaska Area. Please note that under the requirements of Title III of the Superfund Reauthorization Act (SARA), the local fire department, as well as any Local Emergency Planning Committee, maintains records of reportable quantities of hazardous chemicals stored in the community, including their material safety data sheets, along with any reports of chemical releases to the environment, as reportable under the Tier II requirements of the SARA.

### **7310 – Aleutians**

As of June 2014, the most significant release in the Aleutians geographic zone occurred on July 6, 2012, when 20,000 pounds of anhydrous ammonia were released from the F/V Excellence while the vessel was at the dock in Dutch Harbor. The ADEC Spills Database also noted 19 other hazmat releases of 100-plus gallons/pounds, of which 15 involved anhydrous ammonia and three releases involved chlorine gas.

**Chemical Inventory:** Based on the 2011 Tier Two reports, the most prevalent extremely hazardous substances in the region are:

- Anhydrous Ammonia
- Sulfuric Acid

### **7320 – Bristol Bay**

The most significant release occurred on July 21, 2008, when a fire at a fish processing facility resulted in a release of 8,000 pounds of anhydrous ammonia. The DEC Spills Database also noted three other minor releases of anhydrous ammonia and a release of hydrochloric acid over the past 17 years of recorded data.

**Chemical Inventory:** Based on the 2011 Tier Two summary report, the most prevalent extremely hazardous substances stored in the region are listed below along with the federally mandated threshold reporting quantities:

- Anhydrous Ammonia
- Sulfuric Acid
- Chlorine

The overwhelming concentration of hazardous chemicals in the Bristol Bay Geographic zone occurs in the City of Naknek, with smaller amounts in Dillingham, Chignik, King Salmon, and Big Creek. Anhydrous ammonia is present in the greatest quantities, followed by chlorine and sulfuric acid.

In addition to these extremely hazardous substances, there is also an indeterminate amount of hazardous materials scattered throughout the Bristol Bay Geographic zone, mostly in formerly utilized defense sites (FUDS) located at Naknek, King Salmon, and Port Heiden. However, because the quantities and locations of these substances either are below reporting requirements or unknown, they have not been included in the hazardous materials inventory in this plan. Large quantities of flammable petroleum products, such

as propane and gasoline, also are stored at several facilities within the geographic zone and a few facilities store and utilize compressed gasses.

### **7330 – Cook Inlet**

The Cook Inlet Geographic zone includes the Municipality of Anchorage, Matanuska Susitna Borough, and Kenai Peninsula Borough. The region is characterized by several medium and large municipalities, and numerous smaller communities, including isolated coastal communities on the Kenai Peninsula, the western side of Cook Inlet, and along interior rivers of the Matanuska Susitna Borough.

This geographic zone has the highest concentration of industrial activity in the state. Numerous facilities within the geographic zone store and utilize chemicals categorized as extremely hazardous. Large quantities of flammable petroleum products, such as propane and gasoline, also are stored at many facilities within the geographic zone. Some facilities store and utilize compressed gasses.

Several hazmat spills or releases have occurred in the Cook Inlet Geographic zone. As of March 2016, the most significant release in this geographic zone was the Alaska Railroad Corporation train derailment release of 120,516 gallons of diesel fuel at Gold Creek on December 22, 1999. The ADEC Spills Database lists 888 hazmat releases of 100-plus gallons/pounds since 1980. Of these, 14 were releases of chemicals classified as extremely hazardous substances (EHS) (anhydrous ammonia, sulfuric acid or hydrochloric acid), and only six exceeded the reporting threshold specified in the Emergency Planning and Community Right-to-Know Act Section 302.

**Chemical Inventory:** The most prevalent extremely hazardous substances in the region are

- Anhydrous Ammonia
- Chlorine
- Hydrochloric Acid (Muriatic Acid) – occurs as a colorless, nonflammable aqueous solution or gas. It has a highly pungent, irritating odor, and it sinks and mixes with water. It is a highly corrosive, strong mineral acid with many industrial uses. Hydrochloric acid is found naturally in gastric acid. When it reacts with an organic base, it forms a hydrochloride salt. Hydrochloric acid is corrosive to the eyes, skin, and mucous membranes. Acute (short-term) inhalation exposure may cause eye, nose, and respiratory tract irritation and inflammation and pulmonary edema in humans. Acute oral exposure may cause corrosion of the mucous membranes, esophagus, and stomach, and dermal contact may produce severe burns, ulceration, and scarring in humans.
- Sulfuric Acid

EHSs are generally transported into the Cook Inlet Geographic zone from southern ports via water and either delivered directly to facilities or transported to facilities by rail or by truck over local road systems within the geographic zone. They may also be transported by vessel, truck, or railcar from Cook Inlet ports and facilities to other Alaska destinations outside of the geographic zone.

### **7340 – Kodiak**

There have been relatively few major hazardous materials spills or releases in the Kodiak Geographic zone. The most significant occurred in April 1997, when a fire at the Star of Kodiak fish cannery released thirty pounds (30 lbs.) of anhydrous ammonia.

**Chemical Inventory** - Based on tier two reports contained in the CAMEO database, the most prevalent extremely hazardous substances stored in the region are listed below along with the federally mandated threshold reporting quantities:

- Anhydrous Ammonia
- Sulfuric Acid
- Chlorine - (Chlorine is not currently present in quantities that require federally mandated reporting, but is known to be stored in smaller amounts in several communities.)

The overwhelming concentration of hazardous chemicals in the Kodiak Geographic zone occurs in the City of Kodiak, with smaller amounts identified in Port Lions, Larsen Bay, Alitak Bay cannery, Port Bailey cannery, and Port O'Brien cannery (Uganik Bay). Anhydrous ammonia is present in the greatest quantities, followed by the extremely hazardous substances of sulfuric acid, found at three communications facilities, and chlorine. Though now stored in quantities below reporting requirements, noteworthy amounts of chlorine can still be found in the Kodiak Geographic zone. Anhydrous ammonia has been identified by ADEC in five facilities in the Kodiak Geographic zone, and the seafood processing facilities in the City of Kodiak and the remote communities (Port Bailey, Port O'Brien, Larsen Bay, and Alitak) are the prime users. The Kodiak Launch Complex, located approximately 50 miles south of the city of Kodiak, uses the chemical hydrazine in a solid state, which is employed as a rocket propellant for attitude control systems. Hydrazine arrives in bulk shipments at the city docks and is transported by road to the launch facilities where it is stored for short periods pending its use. Because the explosive chemical is only shipped through the city and then stored for periods shorter than required reporting times, it does not fall under federal reporting requirements of the SARA.

In addition to these extremely hazardous substances, there is also an indeterminate amount of hazardous materials scattered throughout the Kodiak Geographic zone, mostly in formerly utilized defense sites (FUDS). However, because the quantities and locations of these substances either are below reporting requirements or unknown, they have not been included in the hazardous materials inventory in this plan. Large quantities of flammable petroleum products, such as propane and gasoline, also are stored at several facilities within the geographic zone and a few facilities store and utilize compressed gasses.

**HYDRAZINE** is highly toxic and dangerously unstable, especially in the anhydrous form. Symptoms of acute (short-term) exposure to high levels of hydrazine may include irritation of the eyes, nose, and throat, dizziness, headache, nausea, pulmonary edema, seizures, coma in humans. Acute exposure can also damage the liver, kidneys, and central nervous system. The liquid is corrosive and may produce dermatitis from skin contact in humans and animals. Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Severe over-exposure can result in death.

### **7350 – North Slope**

The North Slope Geographic zone boundaries are equal to the North Slope Borough boundaries, which also define the Local Emergency Planning District (LEPD). The North Slope Borough Local Emergency Planning Committee (LEPC) represents the entire geographic zone. The City of Barrow is the largest community in the region. Small communities are scattered throughout the borough. Industrial activity is comprised largely of the oil production fields at Prudhoe Bay and other locations on the North Slope.

**Chemical Inventory** - Based on Tier Two reports contained in the CAMEO database, the most prevalent extremely hazardous substances in the region are:

- Sulfuric Acid (pure and battery electrolyte)
- Hydrochloric Acid – a colorless to light yellow liquid. It has a strong pungent odor and reacts violently with water. The acid causes respiratory tract burns, skin burns, eye burns, digestive tract burns, and is harmful if inhaled or swallowed. It may also be harmful if absorbed through skin. Water runoff from firefighting may be corrosive. Contact with metals liberates flammable gas. Corrosive gases/fumes are given off during burning or thermal decomposition.
- Hydrogen Peroxide - a clear, colorless, odorless liquid and is an oxidizer. The chemical is very hazardous in case of skin contact (irritant), or eye contact (irritant). It is slightly hazardous in case of inhalation (lung sensitizer). Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Prolonged exposure may result in skin burns and ulcerations. Over-exposure by inhalation may cause respiratory irritation. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering. Contact with combustibles may cause fire. The chemical decomposes yielding oxygen that supports combustion of organic matters and can cause overpressure if confined.
- Chlorine

Extremely hazardous substances are generally transported into the geographic zone from southern points via truck.

### **7360 – Northwest Arctic**

The Northwest Arctic Geographic zone includes the Northwest Arctic Borough and the area of the Seward Peninsula.

The region encompasses two Local Emergency Planning Districts (LEPD) as defined under State statute and the federal Emergency Planning and Community Right-to-Know Act of 1986 (EPCRA). These two LEPDs are the Northwest Arctic Borough LEPD and the Nome LEPD.

The region is characterized by predominantly isolated coastal communities with some communities located along interior rivers. Industrial activity is limited, with the exception of the Cominco Red Dog mine, located 60 miles northwest of Kotzebue, and other mining activities outside of Nome. Although the mines may use extremely hazardous substances in the mining operation, exposure is limited primarily to the worker population, except during periodic transport through or near populated communities.

The ADEC Spills Database lists 427 hazmat spills or releases of various sizes that have occurred in the geographic zone in the 10-year period between January 1, 2007 and December 31, 2016. The most significant release in this geographic zone was a 250,000-pound zinc concentrate spill to tundra on August 12, 2012. The ADEC Spills Database lists 61 hazmat releases of 100-plus gallons/pounds during that period. Of the 427 hazmat spills, 6 were releases of chemicals classified as extremely hazardous substances (EHS) (ammonia [anhydrous], and sulfuric acid), and only 1 exceeded the reporting threshold specified in the Emergency Planning and Community Right-to-Know Act Section 302.

**Chemical Inventory:** Two mining facilities in the geographic zone use large quantities of sodium cyanide, which is used in extracting gold from ore. Several communications facilities and military long-range radar site (LRRS) facilities use large amounts of sulfuric acid for battery power generation.

Bulk fuel facilities are listed for each community in the Community Profiles.

Of the non-EHS, chemicals, the most abundant other hazardous chemicals in the geographic zone include the following:

- Barium Hydroxide
- Calcium Chloride Pellet
- Calcium Oxide (Quicklime)
- Copper Sulfate
- Diesel Fuel
- Lead Concentrate
- Methanol
- Sodium Sulfide Flake, Hydrated
- Zinc Concentrate
- Zinc Sulphate

### **7370 – Western Alaska**

The Western Alaska Geographic zone includes Yukon-Kuskokwim delta region and the adjacent inland areas of western southcentral Alaska. The region is characterized by a mixture of isolated coastal communities and communities located along interior rivers. Industrial activity is limited primarily to seafood processing.

There have been relatively few major hazardous materials spills or releases in the Western Alaska Geographic zone. A minor chlorine release occurred in July 1995 at a school in Nightmute, and a minor ammonia release occurred in Bethel from the Yut Biat Barge in April 1998.

**Chemical Inventory:** Sulfuric acid is the only extremely hazardous substance reported or otherwise identified in significant quantities and is used at seven facilities in the geographic zone. This information is based on Tier Two reports submitted for Reporting Year 2011.

Extremely hazardous substances are transported into the geographic zone from southern ports by water and delivered either direct to facilities or transported to facilities by truck over local road systems. Reference the information provided under the Hazmat Commodity Flow data provided in the next section.

## **7400 – RESOURCES**

### **7410 – Manpower/Equipment**

[The 2010 Hazmat Commodity Flow Study](#) noted serious deficiencies in the State's ability to respond to a hazardous materials incident. The limited offensive response capability is inadequate, and areas exist with significant risks and no response capability. Many of the Local Emergency Planning Committees are making progress towards defensive response capability by developing or maintaining viable local response plans.

Sources of Hazmat response personnel fell into relatively distinct categories depending on the type of organization. Municipal organizations draw their Hazmat personnel primarily from local fire departments. In most cases, Hazmat response is simply one function of the local fire department(s) -- along with firefighting, other forms of disaster management and emergency medical services. Fire department Hazmat personnel include both paid and volunteer members.

Federal organizations with Hazmat response capability draw members from defense installation fire departments. The military fire departments often include both military and civilian personnel.

Industry organizations with Hazmat response capability draw personnel from two areas: facility workers and industry fire departments. The single exception is Philip Environmental, which draws emergency response personnel from their pool of Hazmat site and tank workers.

#### **7410.1 – Federal**

Reference the [Hazardous Materials Response Special Teams Capabilities and Contact Handbook](#) publication for information on federal hazmat responders.

Additionally, the USCG may call upon the Department of Defense's Alaskan Command (as a member of the Alaska Regional Response Team) to provide Hazmat response resources (teams and equipment) from Elmendorf Air Force Base and Eielson Air Force Base.

#### **7410.2 – State**

The Alaska Department of Environmental Conservation (ADEC) is mandated by statute to respond promptly to a discharge of oil or a hazardous substance (AS 46.08.130). The ADEC may contract with a person, business or municipality in order to meet response requirements, or may establish and maintain a containment and cleanup capability (i.e., personnel, equipment and supplies).

Presently, the ADEC has no Level A or B Hazmat response capability, although there is some possibility that ADEC response term contractors could be mobilized out of Anchorage in time to assist in certain Hazmat responses. The ADEC has some monitoring equipment in Anchorage and Fairbanks and there is some capacity for the agency to assist local or nearby response efforts by monitoring airborne contaminant levels.

As an alternative measure, the ADEC has negotiated response agreements with local communities to enhance oil and hazardous substance response capabilities using existing local resources. The ADEC will, in turn, [reimburse the responding local community for expenses incurred during the response](#). Under the provisions of the local response agreement, the local community reserves the right to refuse an SOS's request to respond based on local conditions and overall readiness capability.

The ADEC has formally entered into local response agreements with the Municipality of Anchorage (MOA) and the City of Kodiak whereby the local Hazmat team may elect to respond on the State's behalf to an incident when requested by the State On-Scene Coordinator. These agreements address Hazmat responses beyond the normal jurisdictional boundaries of the MOA and the City of Kodiak.

Information on the Statewide Hazardous Materials Response Team and current hazmat detection equipment and other assets can be found at this link: <http://dec.alaska.gov/spar/ppr/hazmat.htm>

Additionally, information on local/community fire departments can be found in the [Community Profiles](#).

**Collapsible Rigid-Frame Tent Systems (Main System and Deployable System):** These collapsible, rigid frame tent systems are erected at the field decontamination (decon) site, supported with heater systems and soap and water. This three-tent system is the decon system for major population areas.

The main system is pre-positioned in communities with high population densities or risks, and where an operational Level A team exists to provide support with use of the system. The system would consist of

the three-tent configuration with a trailer for storage and transport. The communities equipped with main decon systems include Anchorage (2), Kenai (1), and Mat-Su Valley (1). Anchorage maintains a second system in deployable configuration for responses elsewhere in the state.

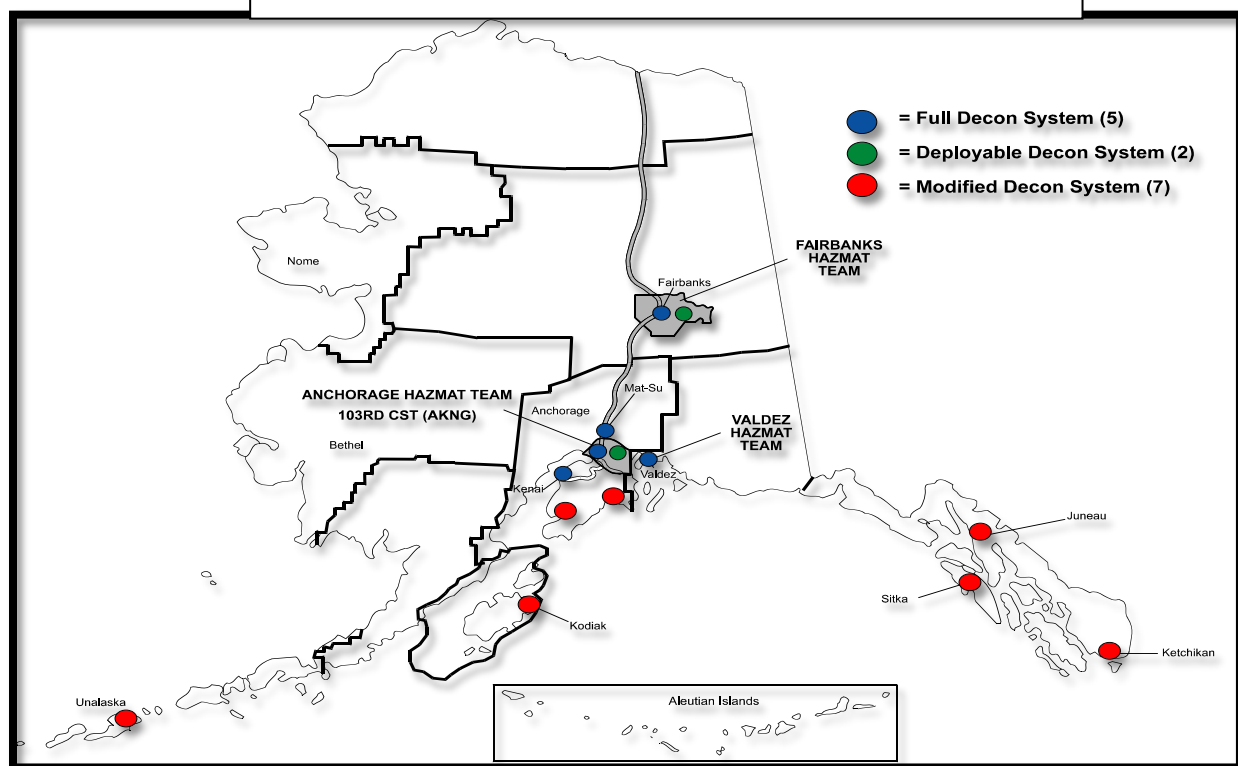

The systems may be collocated with local hospitals to assist with contaminated individuals either self-transported or transported to the hospital via ambulances for decontamination (for both expedient as well as complete decontamination.) Further coordination is ongoing with local hospitals and State medical staff to further develop and enhance the overall mass decontamination capabilities in the state.

**Modified Decontamination System:** A modified tent system was also purchased for smaller at-risk communities with an expressed interest in maintaining a decon system. The modified system consists of a single tent system with support equipment and a trailer for storage and transport. Communities equipped with the modified decon systems include Homer, Juneau, Ketchikan, Kodiak, Seward, Sitka, and Unalaska. Several other communities have requested decon systems as part of their federal Office of Domestic Preparedness grant request. The modified decon system specs and trailer specs were provided to these communities to maintain consistency throughout the state.

The Statewide Hazmat Response Workgroup continues to coordinate with the medical community on issues related to expedient field and hospital decontamination issues. The Hazmat Teams will generally perform expedient decontamination of persons at the scene of an incident. Once decontaminated in the field, individuals are then transported to the hospital or another location for further decontamination. In the event of a major incident involving numerous casualties and contaminated personnel, there is a definite potential for ambulatory and otherwise self-transported patients to arrive at the hospital for decontamination and treatment.

The below figure provides a quick summary of the locations of main and modified decontamination assets in the state.

**Figure 7-2: Statewide Decontamination Assets**

#### **7410.3 – Local Emergency Planning Committees**

Information on the Local Emergency Planning committees can be found at this link:

[https://www.ready.alaska.gov/SERC/LEPC\\_Home](https://www.ready.alaska.gov/SERC/LEPC_Home)

#### **7410.4 – Radiological Detection/Monitoring**

Within the State of Alaska, basic radiation monitoring capabilities are described below. In the event of a radiological incident threatening the State of Alaska, other resources in the lower 48 could be deployed to enhance the area and point detection capabilities.

**Statewide Hazmat Team Radiological Detection Assets:** For a listing of detection equipment maintained by ADEC, EPA, USCG and the Statewide Hazmat Teams, Reference below.

**Department of Defense:** The Department of Defense (DOD) also maintains a variety of radiation detection equipment at four primary locations in the state: Elmendorf AFB and Ft Richardson in Anchorage; Eielson AFB and Ft Wainwright in Fairbanks. These instruments are primarily handheld point detectors for high and low range radiation intensities. Personal dosimeters and film badges are also available in limited quantities. DOD does not maintain airborne monitoring capabilities in Alaska. For a listing of DOD radiological equipment assets located within Alaska, Reference below.

**United States USCG:** Radiological equipment for USCG D17 units includes two different types of gear: the Personal Radiation Detector (PRD) or PM1703GN, and the Radioactive Isotope Identifier (RIID) or identiFINDER-U.

#### **Other Federal Agency Assets (EPA, FEMA, DOE, NRC):**

- a. **Department of Energy** - The Department of Energy (DOE) maintains national and regional coordination offices as points of access to Federal radiological emergency assistance. The Regional Coordination Office for DOE Region 8 is the Richland Operations Office.
- b. **Radiological Assistance Program, Region 8, Richland Operations Office, Richland, Washington** - The Region 8 Radiological Assistance Program (RAP) is responsible for providing assistance in monitoring and assessment activities associated with radiological incidents or emergencies and coordinating U.S. Department of Energy resources as needed in the States of Washington, Oregon and Alaska. The RAP team is made up of teams composed of qualified DOE, Richland Operations Office (RL), and RL contractor personnel who are experts in monitoring radioactive materials involved in the incident. The RAP Team Leader (an RL official or designee) is responsible and has the authority to activate the resources and support necessary when assistance is requested. The radiological assistance teams are deployed in support of the State authorities and/or lead federal agency and are not intended to direct actions at the scene or assume command and control, except when DOE is the lead federal agency.

The RL can request the assistance of the other emergency response assets should the existing capabilities of the RAP team be inadequate to accomplish the task. Requests can be made through the Region 8 RAP or through DOE-Headquarters Emergency Operations Center through a 24-hour telephone number. Determination to activate or deploy the emergency response assets will be made by the National Nuclear Security Administration Office of Emergency Response, located in Washington, D.C.

Specialized expertise and equipment capabilities are located throughout the DOE and DOE contractor system. The DOE radiological assistance teams are knowledgeable of the DOE resources and may request their use, including other federal assets listed below.

- c. **Federal Radiological Monitoring and Assessment Center, DOE, Nevada Operations Office** – The Federal Radiological Monitoring and Assessment Center (FRMAC) is an operational center located at or near the scene of a radiological incident and provides a focal point to compile and coordinate all off-site federal radiological monitoring and assessment activities. The FRMAC is established when a major radiological emergency exists. A major radiological emergency is determined when a request for assistance requires capabilities exceeding those of the DOE regional RAP team. A request for additional assistance is recommended to the senior official or lead federal agency official.

The FRMAC is self-supporting, including specialized resources in radiation protection, legal and medical support, communications, logistics, videos, and administration. A FRMAC could be deployed as a unit or separately, as conditions dictate. Specific capabilities could be requested, e.g., Aerial Measuring System and the National Atmospheric Release Advisory Capability.

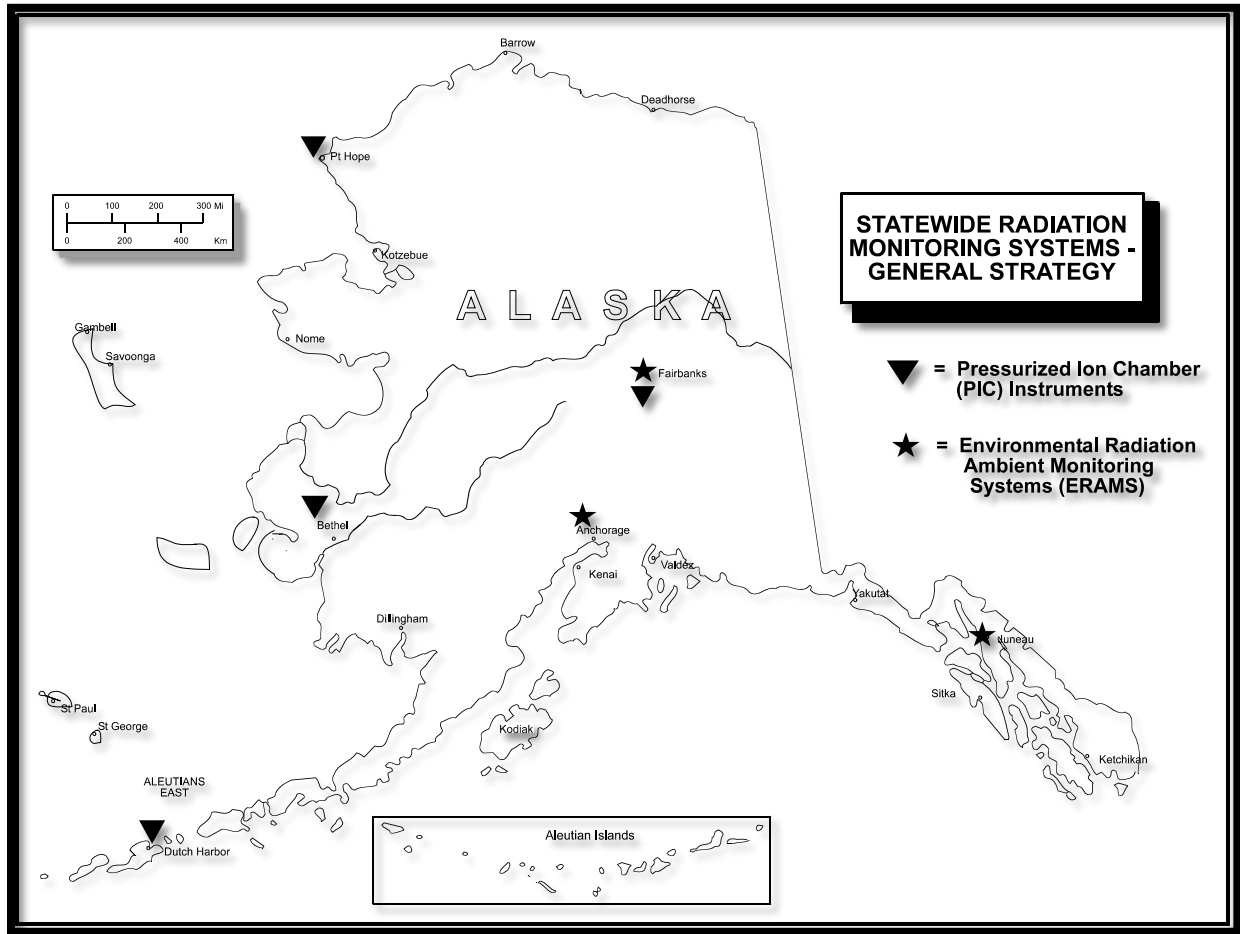

- d. **Aerial Measuring System, DOE, Nevada Operations Office** – The Nevada Operations Office contractor, Bechtel Nevada, can provide aerial measurements of ground surfaces through gamma spectroscopy. They also have a capability to make in-plume air concentration measurements in the event of a reactor accident release, large area continuous release, or contamination incident. Aerial photography can be performed simultaneously with isodose and isoconcentration curves. The aerial measurement survey is primarily used for making rapid radiological assessment of substantial land areas and the analysis and identification of the radioactive emissions from a source.

- e. **National Atmospheric Release Advisory Capability, DOE, Oakland Operations Office** – Another major DOE resource maintained at Lawrence Livermore National Laboratory is the National Atmospheric Release Advisory Capability (NARAC). The NARAC is a centralized computer-base system that estimates the transport, diffusion, and deposition of radioactive materials released to the atmosphere and dose projections to people and the environment.
- f. **Radiation Emergency Assistance Center/Training Site, DOE, Oakridge Operations Office** – Radiation Emergency Assistance Center/Training Site (REAC/TS), operated by the Medical Sciences Division of the Oak Ridge Institute for Science and Education for the U.S. Department of Energy, provides 24-hour assistance with medical and health physics problems associated with radiation accidents in local, national, and international arenas. REAC/TS is prepared to deploy to a radiological emergency with the FRMAC to provide:
  - Medical and radiological triage
  - Decontamination procedures and therapies for external contamination and internally deposited radionuclides, including chelating therapy
  - Diagnostic and prognostic assessments of radiation induced injuries, and
  - Radiation dose estimates by methods that include cytogenetic analysis, bioassay, and in-vivo counting.

## 8000 – SALVAGE & MARINE FIRE FIGHTING

---

This section is an On Scene Coordinator's (OSC) guide to marine firefighting, salvage, and lightering operations. This document is designed to work in concert with the Incident Command System Operational Period Planning Cycle and should be used as a reference before or *during* an incident in order to assist with initial actions when preparing an Incident Action Plan for marine firefighting, salvage and/or lightering operations. This document is *not* intended to be an all-inclusive technical guide to vessel marine firefighting, salvage or lightering. For technical guidance, OSCs should Reference resources and references covered in below.

### 8100 – MARINE FIRE FIGHTING

Normally fighting a shipboard fire is the responsibility of the ship's crew and owner. Tank vessels and non-tank vessels greater than 400 GT operating in U.S. navigable waters are required to have vessel response plans that detail marine firefighting and salvage operations. Local government resources may be used to fight the fire. State or federal government resources are not normally used to fight shipboard fires unless there is a threat to human life or safety or the fire threat creates a release of oil or hazardous substance. Funds available through the Oil Pollution Act may be used to fight a shipboard fire to alleviate the threat of pollution.

Navy SUPSALV has a contract with Ardent Global Marine Services to obtain firefighting expertise. The contact number is 202-781-3889 (24 hour).

This section is based on the assumption that a major marine fire, particularly a vessel fire, may require resources beyond those locally available and that effective response will require coordination of resource deployment from a number of organizations. Contingency planning identifies the means and methods necessary to make resources available from federal, state, and local agencies.

Contingency planning is essential for marine fires in general because:

- Marine fires pose unique logistical obstacles;
- Marine fires are rare occurrences and few firefighters have experience responding to them;
- With training mandates for shore-based firefighters up, and training budgets down, few fire departments can afford to train personnel for rare events, such as a marine fire;
- Roles and capabilities among landside firefighters are usually not clearly defined;
- Different communication frequencies are used by different response organizations.

Marine firefighting contingency planning specifically for the Arctic and Western Alaska is essential because of:

- Distances between areas of risk,
- Tides, currents, ice that frustrate response,
- Jurisdictional responsibilities overlap and can be confusing,
- Landside access to vessels, with the possible exception of Port of Kodiak, is difficult,
- Concern over liability,
- Networks and mutual aid protocols are not fully established or practiced in some areas,
- Lack of accessible resources including qualified marine firefighters.

This section provides for a coordinated response by the USCG and other federal, state, local, and civilian forces to fires on board vessels or at waterfront facilities. It provides policies, responsibilities, and procedures for coordination of on-scene forces. Response forces for the purposes of this plan include:

- Public Safety Agencies, including land-based fire departments
- Waterfront Facility Owners and Operators
- Vessel Owners and Operators
- United States USCG
- Other Military Departments or Agencies
- Private Companies and Individuals

## **8110 – Policy and Responsibility**

### **8110.1 - Federal Policy and Responsibility**

The USCG exercises primary federal responsibility for the safety and security of the ports and waterways of the United States. The role of the USCG Captain of the Port (COTP) in a marine fire event is to ensure firefighting efforts are carried out in a manner that does not threaten the safety of life, the environment, or property.

The USCG will render assistance as available, commensurate with each unit's level of training and the adequacy of equipment. The Commandant of the USCG intends to maintain this traditional "assistance as available" posture without conveying the impression that the USCG is prepared to relieve local fire departments or vessel owners of their responsibilities. Paramount in preparing for vessel or waterfront fires is the need to integrate USCG planning and training efforts with those of other responsible agencies, particularly vessel operators or owners, local fire departments and port authorities.

**Request for Federal Resources:** All requests for federal resources or equipment should be made to the USCG COTP Western Alaska through the Unified Command. Significant non-USCG federal resources include U.S. Navy fire tugs, US Navy Supervisor of Salvage (SupSalv), and Military Sealift Command firefighting experts.

**Captain of the Port (COTP) Responsibility:** The USCG COTP exercises primary federal responsibility for the safety and security of the port. This responsibility is discharged by enforcing dangerous cargo regulations, marine terminal safety regulations, port security, and pollution prevention regulations. In emergencies, the COTP may control the movement of ships and boats, establish safety zones, and provide on scene personnel for situation assessment. Responsibilities of the COTP in a major fire aboard a vessel or waterfront facility may include:

- ☐ Conduct notifications.
- ☐ Assume IC for burning vessel underway or at anchor when:
  - The responsible party does not take appropriate action,
  - The fire department with jurisdiction is unable to respond, and/or
  - No fire department has jurisdiction
- ☐ Participate in the Unified Command.
- ☐ Assume operational control of all USCG resources on-scene.
- ☐ Coordinate information flow or processing of technical data from the vessel for the benefit of the local responders.
- ☐ Establish safety or security zones, as necessary.
- ☐ Provide information on involved waterfront facilities.

- ❑ Provide information on the location of hazardous materials on the vessel, or at the facility, if available.
- ❑ Provide technical data on ship's construction, stability, and marine firefighting techniques.
- ❑ Respond to oil or hazardous materials discharges.
- ❑ Obtain tugs to assist in relocating moored or anchored vessels.
- ❑ Alert owners/operators of terminal or vessel at risk.
- ❑ Notify and consult with appropriate natural resource trustees when the incident results in a pollution threat or may otherwise affect resources under the trustee management authority.

## **8110.2 - State Policy and Responsibility**

### *8110.2.1 - Division of Homeland Security and Emergency Management (DHS&EM)*

The Alaska Department of Military and Veterans Affairs, Division of Homeland Security and Emergency Management (DHS&EM) operates the State Emergency Coordination Center (SECC) and helps coordinate and provide logistic support for the response of state agencies to emergencies and disasters. In addition, DHS&EM, through the SECC, will coordinate with federal government agencies to request assets that are not available from local and State resources, such as the Disaster Mortuary Operational Response Team (DMORT), the Disaster Medical Assistance Team (DMAT), and DOD MEDEVAC resources.

With regard to potential situations associated with marine fires, four general criteria will dictate a response by the State. These are listed below in priority order from a response standpoint:

- Search and rescue, evacuation
- Local Emergency Declaration
- Investigation or response to possible criminal activity
- Firefighting operations
- Oil or hazardous substance release

### *8110.2.2 - Department of Public Safety*

In situations where there may be concurrent emergency issues [e.g., a cruise ship requiring firefighting assistance, search and rescue (SAR) support, and spill response coordination], lifesaving efforts will take precedence over all other emergency operations. In this situation, the Department of Public Safety through the Alaska State Troopers Office for SAR operations will serve as the SOSC.

**Request for State Resources:** State resources can be requested from the Alaska Department of Public Safety through the Alaska State Trooper's 24-hour dispatcher at 907-486-4121 or 800-478-9300 or 911.

The Alaska State Troopers will be involved when there is the possibility that the cause of the casualty was due to criminal activity. They will assist the FBI. They may also provide persons for the USCG Away Team. The Alaska State Trooper Fish and Wildlife Enforcement Division maintains a patrol vessel in Kodiak (M/V Woldstad) that has a fire monitor. This vessel, if in port, may be able to provide waterside cooling water or rescue.

### *8110.2.3 - Alaska Department of Environmental Conservation*

The Alaska Department of Environmental Conservation (ADEC) is the lead State agency with jurisdiction for responding to releases of hazardous material and oil spills. During a ship fire, the State On-Scene Coordinator (SOSC) will direct and coordinate the State's response to an actual or potential spill. The USCG will coordinate with ADEC whenever a vessel is in distress and a threat of oil or hazardous materials release exists. ADEC SOSCs can be notified through the Alaska Department of Public Safety through the Alaska State Trooper's 24-hour dispatcher at 800-478-9300.

ADEC has a local response agreement with the City and Borough of Kodiak for oil and hazardous material response.

**ADEC Responsibilities:**

- Participate in the Unified Command.
- Provide portable communications equipment to response personnel, as needed.
- Assume operational control of all State resources on-scene.
- Respond to oil or hazardous materials discharges. Mitigation, removal and cleanup efforts may be delayed until the firefighting operations are terminated.

**8110.3 - Local Response Agency Policy and Responsibility**

*8110.3.1 - Land-based fire departments*

Land-based fire departments are responsible for fire protection within their jurisdictions. Local fire departments will respond to shipboard fires within the limits of their capabilities. If the crew cannot control the fire, the local fire chief or designee should take tactical control of the firefighting operations. The master should assist the fire chief in the performance of firefighting operations. However, it should not be assumed that local fire departments are capable of providing on-board suppression and internal entry even if they assume tactical control.

Typical responsibilities of the municipal fire departments may include:

- Participate in the Unified Command.
- Establish and staff a Command Post.
- Provide water, air supply and foam for on board firefighting
- Determine the need for, and request mutual aid.
- Make all requests for USCG/Federal personnel, equipment, and waterside security through the COTP.
- Establish liaison with police department and emergency medical services for landside traffic and crowd control, scene security, treatment and transport of the injured, and evacuation.

*8110.3.2 - Mutual Aid Agreements*

All Fire Departments, including the USCG Integrated Support Command, have signed mutual aid agreements with the other area fire departments. Assistance for firefighting or emergency aid are made and rendered between the fire chiefs or their designees.

**8110.4 - Responsible Party**

*8110.4.1 - Vessel*

The vessel master is responsible for planning and directing firefighting efforts aboard the vessel as well as for the safety of the vessel and crew. The presence of local firefighters and/or the USCG does not relieve the master of command or transfer the master's responsibility for overall safety on the vessel. However, the master should not normally countermand any orders given by the local incident commander in the performance of firefighting activities on board the vessel, unless the action taken on clearly endangers the safety of the vessel or crew. Actions by the USCG or other response agencies do not relieve the vessel owner, operator, or master of liability. The master should work closely with the incident commander on scene to coordinate firefighting efforts. This will include providing information regarding actions taken by the crew, the vessel's layout, firefighting capabilities, and the location and types of cargo aboard.

If the crew cannot control the fire, the local fire chief or designee should take tactical control of the firefighting operations. The master should assist the fire chief in the performance of firefighting operations. However, it should not be assumed that local fire departments are capable of providing on board suppression and internal entry even if they assume tactical control. The vessel master should immediately bring to the attention of the fire chief and the Unified Command any action taken or planned that threatens the safety of the vessel, crew or nearby people or property.

#### *8110.4.2 - Owners/Operators of Waterfront Facilities*

Most waterfront facilities have limited firefighting resources and rely on local fire departments for fire protection. Therefore, in the event of a marine fire, facility operators are responsible for ensuring the safety of facility personnel, as well as for providing the incident commander with information regarding the facility's layout and the location of dangerous materials. In the event of a fire onboard a vessel moored to the facility, the facility operator shall assist the vessel's master, the incident commander, and the COTP to the maximum extent possible.

**Fire-wires** or towing-off wires are mooring wires hung over the off-berth side of the ship at both the bow and stern. They enable tugs to pull the ship free from the pier without the assistance of the crew in case of serious fire or explosion. Due to the extreme tidal currents and close proximity of the three primary facilities in Nikiski, these facilities (Agrium, ConocoPhillips and Tesoro) have instituted requirements for the deployment of fire-wires while vessels are moored at their respective terminals. Specifications and procedures for deployment of the fire-wires are in accordance with Section 3.11 of the Oil Companies International Marine Forum (OCIMF) Mooring Equipment Guidelines.

#### *8110.4.3 - Fires on unmanned/moored vessels -owner/operator/crew is not available.*

In this case, the facility owner and the local fire chief should work together in mitigation efforts. The local fire chief or designee should take tactical control of the firefighting operations. However, it should not be assumed that local fire departments are capable of providing on board suppression and internal entry even if they assume tactical control.

### **8110.5 - Other Potential Participants**

The following organizations have firefighting resources that may be available to respond with equipment and personnel.

- USCG ISC Kodiak
- Navy Supervisor of Salvage
- US Air Force (Elmendorf)
- US Army (Fort Richardson)
- Alaska Department of Natural Resources, Forestry Division
- Private contractors/consultants from outside the area

## **8120 – Planning**

### **8120.1 – Firefighting Areas**

NOTE: Prior to taking action for any of the scenarios below, responders should consult the [Potential Places of Refuge Section](#) in this plan.

**Potential Harbors of Refuge:** A ship on fire may present immediate risks to adjacent life or property, and the environment. More than likely, there will be substantial logistical firefighting problems. The Unified Command will review the facts of each event and determine if a ship should be moved, and if so, where the ship would best be situated, either to fight the fire or to minimize associated impacts. Ships may be moved to or from piers, to anchor or, possibly in extreme cases, to grounding or sinking sites. In moving a stricken vessel, primary consideration shall always be given to the actions necessary to save lives.

Areas of particular sensitivity to oil spills from damaged vessels are discussed and identified in the Sensitive Areas Section of plan. These areas should be avoided, if the situation allows Unified Command to choose among several potential places of refuge.

Within each harbor of refuge, there are potential firefighting piers, anchorages and grounding sites. The Unified Command must consider a number of factors before directing or towing a ship to a specific location. Some of the considerations are listed below.

1. **Potential Firefighting Piers:** Although piers are not the only sites that can, or should be considered for locating a burning ship, they may offer the greatest potential to maximize the use of shore-based firefighting resources. The following factors should be considered when selecting a pier:
  - The severity of the fire
  - The proximity of the pier to populated areas
  - Environmentally sensitive areas
  - Availability of the pier for an extended period
  - Availability of water and electricity
  - Construction of the pier
  - Prevailing winds
  - Availability of firefighting staging areas
  - Presence of hazardous materials at the pier and on the vessel
  - Availability of special equipment.

The selection of a pier or facility does not mean that the USCG or any other agency will unilaterally direct a burning vessel to that facility. At a minimum, a decision of this nature must be discussed with representatives of:

- The vessel
- The facility
- The appropriate port authority
- The appropriate fire department
- The USCG
- The Southwest Alaska Pilots Association (SWAPA)
- Appropriate natural resource trustees (if the incident poses a threat to resources under their respective management authority)
- Other agencies, depending on the particular situation.

2. **Potential Firefighting Anchorages:** If a fire is deemed to pose a significant threat to a facility, pier, or port, or the smoke poses a threat to nearby communities, a decision may be made to move the vessel to a temporary anchorage.

For planning purposes, the following criteria must be considered when selecting potential firefighting anchorages:

- Shelter from wind
- Type of bottom
- Depth of water at mean low tide
- Adequate swing room for the largest vessels
- Facilities for passengers and crew
- Proximity to staging areas
- Whether the site can be boomed off to limit environmental impact in the event of a spill.

The Unified Command will have to consider seasonal sensitivities per site prior to making their decision.

3. **Potential Grounding Sites:** Under certain circumstances, it may become necessary to ground a vessel. Grounding should only be considered if it is determined the vessel might sink or in other ways become derelict.

In choosing grounding sites, several factors must be considered:

- Bottom material: soft enough that the ship's hull will not rupture.
- Water depth: shallow enough that the vessel will not sink below the main deck, yet deep enough that fireboats, salvage barges and tugs can approach; consider depth of water at mean low tide.
- Weather: areas not known to have strong winds or currents that could hamper firefighting or salvage efforts.

Thus, in choosing firefighting grounding sites the following criteria must be considered for planning purposes when selecting these potential locations:

- Shelter from wind
- Type of bottom
- Depth of water
- Proximity to staging areas
- Whether the site can be boomed off to limit environmental impact in the event of a spill.

The Unified Command will have to consider seasonal sensitivities per site prior to making their decision.

4. **Offshore Locations for Intentionally Sinking Vessels:** When a vessel and cargo are deemed a total constructive loss and intentional sinking of the vessel is being considered, the COTP will consult with the potentially-affected natural resource trustees, the Environmental Protection Agency, and other appropriate stakeholders (e.g., Tribal and State government and U.S. Army Corps of Engineers representatives) and will obtain any necessary permits. This consultation could be accomplished through an incident-specific activation of the Alaska Regional Response Team.

#### **8120.2 – Control over Waterfront Areas**

The COTP may find it helpful to control or restrict traffic in an affected area to provide safety for the waterfront facilities or vessels. The COTP has sole authority to establish a safety zone. Implementation and enforcement of the safety zone is a joint effort of Sector Anchorage and any Coast Guard cutter involved in the enforcement of the zone.

1. **Control of Vessel Movement:** Reference [33 CFR 6.04-8](#) for guidance on the USCG Captain of the Port (COTP) authority over vessel movement.

2. Safety Zones: Reference [33 CFR 165](#) for guidance on the COTP authority to establish safety zones.

## **8130 – Operational Response Actions**

### **8130.1 – Command and Control**

A major waterfront or shipboard fire will involve response teams from Federal, State, and Local agencies. The nature and location of the fire will be the deciding element in determining which agency assumes overall command or lead agency<sup>1</sup> in a unified command. Overall command or lead agency must be determined early in the incident to ensure the effective use of personnel and equipment.

**Overall Command and Control:** Initially, response organizations, including the crew of the vessel on fire, will act independently, reacting to events as they occur. For serious casualties, responders must soon combine or coordinate their actions. The goal is to quickly establish a Unified Command with the COTP, local fire department incident commander, vessel owner/operator, affected facility operator and the State On-Scene Coordinator. The USCG COTP will ensure that an adequate response is undertaken.

**Unified Command:** In instances when several jurisdictions are involved or several agencies have a significant management interest or responsibility, a Unified Command (UC) with a lead agency designation may be more appropriate for an incident than a single command response organization. Generally, a unified command structure is called for when:

- The incident occurs within one jurisdiction but involves several agencies due to the nature of the incident or the resources needed to respond.
- The incident is multi-jurisdictional in nature because it affects or has the potential to affect several jurisdictions.

The USCG COTP will ensure the Unified Command functions efficiently. When response agencies and the responsible party are unable to agree and implement response actions, the COTP will direct the response.

The USCG COTP will consult with appropriate natural resource trustees when the incident is a pollution threat or may otherwise affect resources under their respective management authority. The USCG COTP will also consult with other stakeholders (e.g., Tribal representatives) as appropriate.

### **8130.2 – Communication**

An effective, well-coordinated communications plan must cover the areas of designated frequency, usage, responder compatibilities, outside communications support and logistics. When dealing with multiple agencies at a marine incident, such factors must be addressed.

**Response Communications:** It is vital that all responders be able to communicate directly. A shipboard fire incident or emergency creates several unusual communications problems. Because most commercial vessels are constructed of steel, fire service radios are unlikely to work well within a vessel. In Alaska, commercial vessels, the USCG, and municipal fire departments use very high frequency (VHF) radio systems. Thus, primary communications frequencies will be VHF. Incident command will establish tactical channels or frequencies based on the capabilities of all the involved parties. Most foreign ships will also have limited VHF radio frequencies. As such, a common channel should be used during the initial hours of the response. (Preferred VHF frequencies for use during the initial stages of a response appear below.)

---

<sup>1</sup> Usually, the organization that has committed the most resources will assume the role of lead agency.

Connecting interagency radio frequencies may require an exchange of radio equipment. If the on-scene fire department does not have VHF radio capability, handheld VHF radios shall be provided to the fire department. Additional handheld VHF radios may be obtained from the USCG, the vessel, the facility, the vessel agent, the harbormaster, or a commercial contractor. The initial communications frequencies will quickly become saturated and thus the Incident Command should move towards establishing a comprehensive communications plan and designating additional working (tactical) frequencies.

A considerable communications capability is also available through various State agencies. The ADNR Division of Forestry and The ADMVA Division of Homeland Security and Emergency Management are both equipped with impressive communications assets. The ADEC also maintains an extensive arsenal of communications equipment.

**Primary USCG Emergency Radio Frequencies:**

- Marine Band Channel 81A operates at 157.075 MHz and is the primary Marine Safety operating frequency. Channel 81A is also the national marine pollution response coordination channel. 81A is the primary means of radio communication between marine safety field teams and contractor teams during emergency responses. Channel 81A is the preferred channel to establish initial radio communications between vessel crew, shore responders and USCG personnel.
- Marine Band Channel 83A operates at 157.175 MHz and is the USCG Auxiliary primary operating channel. The COTP may preempt the use of this channel in emergencies. 83A is used as an overflow channel for 81A during emergency case prosecution.
- Marine Band Channel 22A operates at 157.100 MHz and is the primary USCG-public liaison channel. Urgent marine broadcasts are announced on 16 and are broadcast on 22A. During emergency responses, 22A may be used by USCG to inform mariners of hazardous conditions or restrictions on the use of waterways.
- Marine Band Channel 16 operates at 156.800 MHz and is the international hailing and distress frequency. In an emergency, channel 16 may be used by to alert mariners of urgent COTP information broadcast on 22A. FCC regulations prohibit the use of Channel 16 by land-mobile stations and non-SAR land-fixed stations.

**Fire Mutual Aid Radio System:** The FCC has designated three frequencies, 154.126, 154.260, and 154.290 MHz, as the Fire Mutual Aid Radio System (FMARS) to provide for common communications between firefighting units from different agencies operating at a common incident. These frequencies should be utilized when establishing a long-term communications plan for an incident response.

**Landline and Cellular Communications:** Cellular communications may be a means of communication between USCG and fire department personnel on scene.

**SSB/Satellite:** Single Sideband radios and the global satellite network are available for short and long-range communications.

**Circuit Discipline:** The following guidelines must be adhered to during a major crisis to keep communications problems to a minimum:

- Do not deviate from assigned working frequencies unless it is for the purpose of re-establishing communications.
- Limit radio traffic to essential communications only.

- Limit length of transmissions in keeping the frequency clear for emergency traffic only. Information containing lengthy operational details should be passed by alternate means whenever possible.

**Communications Security:** Secure communications systems available to Sector Anchorage and other USCG units include Secure Telephone Equipment (STE), and data encrypted security (DES) VHF-FM radios. Use of these systems to communicate information will be at the discretion of the COTP.

**Lessons Learned:** Effective communications are always difficult to achieve during multi-agency response efforts. As such, communications procedures should be rehearsed during all marine firefighting drills. Lessons learned from exercises and actual events must be incorporated into this plan.

### **8130.3 – Exercises and Training**

**Exercises:** Joint exercises and training, which include local fire departments, vessels, facilities, and government agencies, will enhance working relationships and contribute to a more effective response, as well as demonstrate the capabilities of the various organizations involved. These exercises also point out possible conflicts or weaknesses in the plan.

Periodic exercises with selected fire departments, port facilities and government agencies will be conducted. Each fire department or response organization should coordinate with port facilities and marine users in their respective jurisdictions to establish a training and exercise schedule. The workgroup that developed this plan understood that the USCG COTP should take the lead in promoting and organizing area-wide exercises. The USCG should fix the time and frequency of large multi-agency exercises in order to allow fire departments time to designate exercise funds in their annual budgets. Exercise planners should consider conducting at least a portion of the exercise on a weekend to allow volunteer firefighters the opportunity to participate.

All interested parties and stakeholders should be encouraged to participate or observe the exercises.

The USCG should limit the number of exercises (security, pollution, and firefighting) but make them comprehensive. For example, area maritime security exercises should incorporate marine firefighting scenarios. The USCG and ADEC should grant appropriate oil spill PREP credit when marine fire response exercises promote and practice inter-agency response tactics, strategies, communications, and organization.

**Training:** Training is the cornerstone of effective response. Local fire departments, port facilities, and government agencies will establish their own training programs and should incorporate into their training programs the contents of this plan, the resources available, and the firefighting systems installed on the various vessels, and basic vessel construction. Training programs may be divided into the (1) awareness level, (2) operations level, and (3) technician level. The training guidelines in the National Fire Protection Association (NFPA) #1405 should be consulted in developing training programs.

The training outlined in the International Fire Service Training Association, Marine Firefighting for Land-Based Firefighters, (Chapter 11 and Appendix I) provides one appropriate model-training plan.

## 8140 - Checklists

### 8140.1 – Initial Response: Incident Commander Checklist

#### INITIAL RESPONSE: Incident Commander Checklist

##### Size-up and Incident Information

Time of Incident: \_\_\_\_\_

Location: \_\_\_\_\_

Vessel name: \_\_\_\_\_

Registry: \_\_\_\_\_

Contact: \_\_\_\_\_

Rank: \_\_\_\_\_

Vessel type:

☐ Passenger ship

☐ Ferry

☐ Fishing Vessel

☐ Military

☐ Recreational

☐ Processor (ammonia tanks?) ☐ Y ☐ N

☐ Container

☐ Tug

☐ Tanker (cargo): \_\_\_\_\_

☐ Barge (cargo): \_\_\_\_\_

☐ other: \_\_\_\_\_

Number of crew and passengers \_\_\_\_\_

Are they all accounted for? ☐ Y ☐ N

Are there any injuries? ☐ Y ☐ N

If injured, how many and to what extent? \_\_\_\_\_

Vessel is: ☐ Anchored ☐ Moored ☐ Underway

Maneuverability impaired?

☐ Y ☐ N

Stability

Compromised?

☐ Y ☐ N

Fuel onboard: \_\_\_\_\_

(Type and amount, tank capacities and locations.)

HAZMAT onboard: \_\_\_\_\_

(Type, amount, and locations.)

##### Incident Type

☐ Fire (location): \_\_\_\_\_ ☐ Explosion (location): \_\_\_\_\_

☐ Collision ☐ Grounding ☐ Spill / Hazmat ☐ Other: \_\_\_\_\_

Weather conditions: Temp: \_\_\_\_\_ Winds: \_\_\_\_\_ Wave height: \_\_\_\_\_ Tides: \_\_\_\_\_

What is currently being done by the ship's crew to mitigate the incident? What is their plan?

What immediate assistance does the vessel need?

☐ Firefighting resources:

☐ Water ☐

Foam

☐ SCBA Air

☐ Firefighters

☐ Tug assist.

☐ Search and rescue vessels.

☐ Other: \_\_\_\_\_

☐ Nothing

Fire Plans? ☐ Y ☐ N

Cargo Manifest? ☐ Y ☐ N

Dangerous Cargo/Goods Manifest? ☐ Y ☐ N

##### Incident Command

**Incident Commander:** \_\_\_\_\_

☐ Establish unified command and command post

Time: \_\_\_\_\_

☐ Establish communications with vessel's Master or designee

Time: \_\_\_\_\_

☐ Ensure personnel accountability

## Incident Commander's Checklist, cont.

### Initial Notifications

- ☐ USCG: 487-5555 or Channel 16 VHF
- ☐ Local Public Safety Dispatch: 486-8000 or 911

Time: \_\_\_\_\_  
Time: \_\_\_\_\_

### Risk Assessment

#### Consider the following:

- ☐ Location of fire / fire behavior
- ☐ Condition of the vessel, vessel trim and stability
- ☐ Are mooring lines exposed to fire?
- ☐ Dangerous cargo / HAZMAT nearby?
- ☐ Available resources

### Firefighting Tactical Priorities

### PROVIDE FOR LIFE & SAFETY FIRST!

- ☐ **Rescue** – Rescue victims in immediate danger.
- ☐ Primary search.
- ☐ Secondary search.
- ☐ Number and location of victims:
- ☐ Establish secondary means of egress.
  
- ☐ **Exposures** – Protect other vessel areas, other vessels, and any other structures.
- ☐ Pollution prevention / control.
- ☐ On vessel
- ☐ Other Vessels
- ☐ On dock
  
- ☐ **Confinement** – Contain the fire and prevent it from spreading.
- ☐ Secure power
- ☐ Secure fuel
- ☐ Secure ventilation unless personnel are trapped in the space
- ☐ Consider fixed suppression systems
- ☐ Primary boundary Location:
- ☐ Secondary boundary Location:
- ☐ Monitor all four sides of compartment, above and below
  
- ☐ **Extinguishment** – Control and extinguish the fire.
- ☐ Establish water supply
- ☐ Primary attack team
- ☐ Secondary attack team
- ☐ Ventilation
  
- ☐ **Overhaul/Salvage/Loss Control** – Prevent re-ignition and minimize damage.
- ☐ Dewatering
- ☐ Check for Fire Extension
- ☐ Ventilation/De-smoking
- ☐ Maintain fire watch

**Figure 8-1: Ferry or Cruise Ship Emergency Response Flowchart**

### 8140.3 – Tank Barge Fires

**Tactical Guidelines:** Extinguishing Class B (Flammable/Combustible Liquids) Fires on Deck<sup>2</sup>

#### **Size-up**

- ☐ Determine fuel type (e.g., gasoline, JP-4, JP-5, diesel)
- ☐ Determine source or seat of fire

|                                                                                         |                                    |
|-----------------------------------------------------------------------------------------|------------------------------------|
| <input type="checkbox"/> Internal tank                                                  | <input type="checkbox"/> Overfill  |
| <input type="checkbox"/> Ullage/vent fire                                               | <input type="checkbox"/> Drip pans |
| <input type="checkbox"/> Transfer pipe system (if product being pumped or gravity fed?) |                                    |

- ☐ Evaluate condition of the vessel, vessel trim and stability.
- ☐ Are mooring lines exposed to fire?
- ☐ Dangerous cargo / HAZMAT nearby?
- ☐ What exposures are at risk?
- ☐ Is there a compelling reason to attack the fire?
- ☐ Rescue/persons on board

#### **Safety Considerations**

- ☐ Establish communication with the tanker man, tug operator or other person familiar with the barge
- ☐ Evaluate risk of boarding, including risk of falling over board
- ☐ Are there adequate water supply lines?
- ☐ Is there an adequate number of firefighters, both for attack AND rescue?

#### **Control**

- ☐ Reduce or control fuel source using vessel crew if available
  - ❖ Stop cargo pump
  - ❖ Secure valves
- ☐ Protect integrity of tanks and cargo pipe system
- ☐ Control spilled fuel on product on deck at scuppers.
- ☐ Set and cool boundaries until sufficient foam is on site for an uninterrupted attack.

#### **Attack**

- ☐ If liquids are burning on deck, deploy foam in sufficient quantities to maintain an unbroken blanket over the entire liquid surface. (Example: 0.1 gpm/ft<sup>2</sup> of AFFF for ignited hydrocarbon fires). For a typical fuel barge offloading at Kodiak, this will require a minimum 300-gpm application rate<sup>3</sup>. Use at least two monitors if possible.
- ☐ Use a foam and dry chemical combination attack for fires burning from spraying liquid AND spills.
- ☐ Apply foam on run-off collection points.
- ☐ Cool and maintain a foam blanket over spill to prevent re-ignition. Do not dilute with water.
- ☐ Consider deploying boom, if safe, to prevent spread of pollutants.

---

<sup>2</sup> One reference used in developing these guidelines was *Marine Fire Fighting for Land-Based Firefighters*, International Fire Service Training Association (2001) Published by Oklahoma State University

<sup>3</sup> Assume a surface area of 3000 ft<sup>2</sup> within the confines of the scuppers (100 ft. X 30 ft.).

### 8150 – Response Resources

A major marine fire, particularly a vessel fire, may require resources beyond those locally available and that effective response will require coordination of resource deployment from a number of organizations.

The following categories of response resources were likely to be limited during a major marine fire:

- Portable fire monitors,
- Vessels with fire monitors,
- Tugs,
- Onboard fire suppression teams,
- Firefighting foam,
- De-watering pumping equipment,
- Landing craft and
- Marine firefighting consultants/advisors.

**8150.1 – Aleutians - TBD**

**8150.2 – Bristol Bay - TBD**

**8150.3 – Cook Inlet**

### Marine Firefighting Resource List

Note: This list is a supplement to inventories maintained by Cook Inlet land-based fire departments.

#### 8150.4 – Kodiak

This Marine Firefighting Resource List provides possible sources and suppliers for each of the above categories. Note: This resource information was gathered from a variety of sources. The workgroup that gathered the data cannot validate or verify the accuracy of the information, the capability of the equipment, or the skill/experience of personnel listed. The resources listed below would serve to supplement inventories maintained by Kodiak land-based fire departments.

| PORTABLE FIRE MONITORS                                                                                                |                            |          |                            |           |                      |                                                                                                         |

**FIREFIGHTING FOAM:** Kodiak Fire Departments have significant amounts of foam because of their relative isolation and requirements for aircraft firefighting. However, large 'deep-seated' ship fires will likely exhaust available supplies. The list below is of manufacturers, yet most manufacturers have a limited amount of foam available for immediate shipment. Various refineries and terminals along the West Coast hold large foam caches.

**8150.5 – North Slope - TBD**

**8150.6 – Northwest Arctic - TBD**

**8150.7 – Western Alaska – TBD**

## **8200 – EMERGENCY TOWING**

Alaska's local communities, pristine environment, and socio-economic status could suffer significant negative effects if marine spills are not prevented or responded to and contained immediately.

Within the last decade, several distressed or stricken vessel incidents occurred in Alaska, a few resulting in spills that negatively affected coastline communities with severe environmental and economic consequences. Examples include the groundings of the Motor Vessel (M/V) KUROSHIMA in 1997 and the M/V SELENDANG AYU in 2004. Other near-miss incidents have occurred in which a large vessel lost propulsion or steering capacity and went adrift for some time before regaining control. Many foreign vessels transiting US waters do not carry appropriate or reliable towing systems.

To assist disabled or otherwise stricken vessels, emergency towing systems have been designed to provide the capability for an emergency rescue. By pre-positioning these specially designed Emergency Towing System (ETS) packages in areas of high vessel traffic or risk, potential oil spills can be averted. By reducing the risk of spills, coastal areas can be protected, avoiding potential damage to fish, wildlife and other natural resources.

The ETS may be airlifted to the distressed ship via helicopter or deployed to a disabled ship by tugboat or a vessel-of-opportunity. The system consists of a high strength floating towline (currently considered as best available technology) capable of towing a large vessel, a messenger line to assist in deploying the towline, a line-launcher, a towing shackle, a strobe light buoy, and chafing gear.

The ETS might also be used in the event of vessel grounding. Upon USCG approval, the ETS could be passed to a grounded vessel in support of salvage and towing operations.

There are two sizes for ETS available within Alaska. The larger size is capable of towing vessels greater than 50,000 DWT while the smaller system is designed vessels less than 50,000 DWT. As of 2017, there are seven large and three medium size ETS strategically distributed across the state.

Please review ADEC's website <http://dec.alaska.gov/spar/ppr/prevention-preparedness/ets/> for updated locations and additional information.

## **8300 – MARINE SALVAGE AND LIGHTERING**

### **8310 – Notification of Marine Casualties**

Marine Casualty notification regulations are found in [46 Part 4](#), [33 Part 160.215](#), and [33 Part 155.4010](#) of the Code of Federal Regulations.

### **8320 – Responsibilities of the Responsible Party and FOSC**

In the case of an incident, the Responsible Party (RP) must take adequate measures to mitigate and/or remove damage, or risk of damage, caused by the vessel or the release of any materials from the vessel. The RP will pay for all legitimate response measures, up to their limit of liability. If an RP cannot be identified, or the acting RP fails to adequately respond, it is the responsibility of the Captain of the Port or FOSC to take over control of a particular aspect of, or the entire response. In this case, funding will be provided by the federal government until an RP is identified and charged for the response.

### **8330 – Initial Response and Casualty Assessment**

*Common to all casualties is a need for the quick and substantial allotment of response resources.* The Unified Command will set the objectives of a vessel casualty response. Early dissemination of an accurate assessment of the vessel's condition and deployment of appropriate response resources is essential.

#### **8330.1 – Initial Actions to Be Taken By the Crew**

A prudent vessel captain will take certain actions to mitigate the threat to the crew and vessel. Upon receiving notification of a marine casualty, the Incident Commander should verify that the vessel master, if possible and appropriate, has taken the following actions:

- ☐ Have ship's personnel report to emergency stations
- ☐ Secure watertight fittings
- ☐ Take appropriate firefighting actions
- ☐ Notify the ship's operations controller
- ☐ Obtain an accurate cargo storage plan
- ☐ Request shore personnel request salvage assistance
- ☐ Display day shapes & sound appropriate signals

### 8330.2 – Critical Information

There is certain information that is critical to planning a successful salvage operation. This information, essential to the response planning process, should be gathered from the vessel master or on-scene response personnel, as appropriate to the situation. The information gathered should be used to determine the “window of opportunity” - i.e., when the most factors align for a successful operation.

Following the report of an incident, certain initial information must be gained to mount a successful response and salvage operation. This list is not all-inclusive, but may be used to ensure certain critical information is gathered from on-scene personnel as well as from response resources. Many of the ship design particulars may be retrieved from the vessel’s Shipboard Oil Pollution Emergency Plan (SOPEP) and Vessel Response Plan (VRP).

| Incident                    |                                        | Critical Information |
|-----------------------------|----------------------------------------|----------------------|
| All Incidents               |                                        |                      |
|                             | Safety status of crew                  |                      |
|                             | Proximity to navigation hazard         |                      |
|                             | On-scene weather conditions            |                      |
|                             | Forecasted weather conditions          |                      |
|                             | Contracted resources                   |                      |
|                             | Potential damage / breaches in hull    |                      |
|                             | Potential for spill or plume           |                      |
|                             | Status of ground tackle                |                      |
|                             | Communications nature and schedule     |                      |
|                             | Quantity/nature of cargo/fuel/ballast  |                      |
|                             | Status of propulsion & steering        |                      |
| Grounding                   |                                        |                      |
|                             | Pre-casualty drafts                    |                      |
|                             | Post-casualty drafts                   |                      |
|                             | Tide height at grounding               |                      |
|                             | Location/depth of soundings            |                      |
|                             | Time/Height of next high tide          |                      |
|                             | Liquid level of all tankage            |                      |
|                             | Availability of salvage resources      |                      |
|                             | Bottom type                            |                      |
| Fire                        |                                        |                      |
|                             | Status of shipboard fire pumps         |                      |
|                             | Status of fixed firefighting systems   |                      |
|                             | Risk of further damage to vessel       |                      |
|                             | Status of emergency electrical systems |                      |
|                             | Availability of firefighting resources |                      |
| Collision/Allision/Flooding |                                        |                      |
|                             | Relative stability of each vessel      |                      |
|                             | Status of ships dewatering systems     |                      |
|                             | DOT, ACOE, State notified (allisions)  |                      |

### 8330.3 – Identify Response and Salvage Assets

The RP should immediately contract and set into motion adequate response and salvage resources. Historically, there has been reluctance on behalf of the vessel's representatives to engage a professional salvor. A decision to attempt operations without a professional salvor should be examined critically by the FOSC. To assist the RP in contracting a professional salvor, the FOSC may share information of proven response and salvage resources as listed below. In addition to ensuring that the RP has contracted adequate response resources, the FOSC should identify and deploy appropriate USCG resources to respond to the incident. These response teams should include unit Pollution Investigators, Casualty Investigators, and Vessel Inspectors. Furthermore, the SERT team at the Marine Safety Center should be engaged and, potentially, the Navy SUPSALV. Contact numbers for these assets may be found [in Section 8370](#) below.

Areas should keep a current listing and contact information for professional salvor resources located within their zone. This list may be referred to or provided to an RP when ensuring a time allocation of tug and salvage assistance. These are all commercial resources that require funding. When populating this list with salvors, consider company's 24-hour capabilities, employee training, response history, and ability to create an acceptable salvage plan.

If zone involves international border, consider including international assets in this list.

| Resource           | 24-hour phone number | Internet address |
|--------------------|----------------------|------------------|
| Towing / Salvage   |                      |                  |
|                    |                      |                  |
| Oil Spill Response |                      |                  |
|                    |                      |                  |
| HazMat Response    |                      |                  |
|                    |                      |                  |
| Fire Response      |                      |                  |
|                    |                      |                  |

### 8330.4 – Stranded Vessel Quick Response Card (QRC)

Establishing a quick and effective towing arrangement on a stranded vessel or one that has simply lost its ability to maneuver may mean the difference between a simple maneuvering evolution and disaster. The following QRC is provided to ensure that RP is taking appropriate and adequate actions to mitigate risk to the vessel and further impact of the casualty.

#### Vessels Adrift – Risk identification

|                                                                                              |                       |       |
|----------------------------------------------------------------------------------------------|-----------------------|-------|
| Vessel position                                                                              | °Latitude, °Longitude |       |
| Current vessel set and drift                                                                 | degrees True          | knots |
| Predicted set and drift due to weather/tide/current*                                         | degrees True          | knots |
| Nearest shoal, hazard, or shipping lane                                                      | identification        |       |
| Distance to nearest shoal, hazard or shipping lane                                           | nautical mile (nm)    |       |
| Time to reach nearest shoal, hazard or shipping lane<br>(nm/knots of drift) / Estimated time | ** hours              | hh:mm |

\*Vessels adrift may slow their set and drift with the use of a drogue or by lowering their ground tackle, even if it does not reach the sea floor. Slowing set and drift increases critical available response time.

#### Towing Vessels – Time to rig tow

|                                                                                                |          |       |
|------------------------------------------------------------------------------------------------|----------|-------|
| Time to recall vessel crew / Estimated time                                                    | hours    | hh:mm |
| Time to get towing vessel underway enroute to stranded vessel position / Estimated time        | hours    | hh:mm |
| Distance from towing vessel to stranded vessel                                                 | nm       |       |
| Cruising speed of towing vessel                                                                | knots    |       |
| Time till towing vessel on scene (nm/knots) / Estimated time                                   | hours    | hh:mm |
| Time to rig tow / Estimated time                                                               | hours    | hh:mm |
| Time to re-setup for tow if first attempt fails                                                | hours    |       |
| Total time to take control of vessel (hours till on scene + hours to rig tow) / Estimated time | ** hours | hh:mm |

\*\* Time to take control of vessel must not exceed the time to reach the nearest shoal or hazard.

Towing assets should be called upon in the following priority while ensuring adequate response time: (1) Commercial towing vessels (2) USCG assets (3) DOD assets (4) U.S. vessels in the vicinity (5) Foreign vessels in the vicinity

### **8340 – Setting the First Operational Objectives**

Once enough information has been gathered to proceed with a decisive action plan, the USCG Operational Commander, IC or UC will set forth the operational period objectives. These objectives may include but are not limited to:

1. Evacuate crew
2. Control vessel movement
3. Get response personnel and equipment on-scene
4. Extinguish shipboard fire
5. Stop/slow flooding
6. Stop/slow vessel movement toward potential hazards
7. Contain pollution
8. Identify suitable port of refuge
9. Create a salvage plan
10. Mitigate potential impacts of the casualty on other vessel traffic and port activities
11. Evaluate risk to public- i.e., hazardous material release, air quality, etc.
12. Prepare and approve press release
13. Establish a safety zone
14. Contact all appropriate Federal, State and local agencies, as well as foreign governments
15. Evaluate/mitigate the environmental impacts of incident
16. Identify an appropriate lightering vessel

### **8350 – Oil/Hazardous Material Release Mitigation and Lightering**

Oil spills or hazardous material releases are of the greatest potential during groundings and almost a certainty during a major collision or other event when there is a breach in the hull. There are several ways to establish if there is an oil spill or hazardous material release. The primary method may be observation of a sheen emanating from the damaged vessel. However, this method may be of limited usefulness at night and is not indicative of damages inboard of the hull structure. Bunker and cargo tanks should be immediately sounded and monitored closely for changes that would indicate a breach. Given the high correlation between major marine casualties and pollution incidents, it is prudent to provide, at a minimum, a containment boom to surround the vessel(s).

One of the most effective ways to mitigate or prevent an oil spill or hazardous material release is to remove all remaining cargo and unnecessary bunker fuel from the vessel. This is particularly useful when the risk of a hull breach is increasing due to changing environmental or physical conditions on the vessel. Vessels may be lightered to another vessel, or lightered to mobile facilities ashore. Choosing which is most appropriate will depend on the location of the vessel and availability of each. Whichever is chosen, it is important to ensure the receiving vessel or facility is qualified to handle the lightered material and that any cargo/residue in hoses and holding tanks are compatible with lightered material. Furthermore, the effects on the stability of the vessel should be taken into account when lightering a vessel. While lightering may present benefits when attempting to re-float a vessel, it may also present additional structural stresses upon the vessel. It is important to work with naval architects as well as the person in charge of loading/offloading the vessel, who is frequently the Chief Officer or First Mate of the vessel.

### **8360 – Vessel/Cargo Salvage Plan Review**

A plan is essential to any successful salvage operation. Depending on the urgency and complexity of the operation, the quality of the plan may vary from a bound document approved by engineers to a sketch on

a cocktail napkin. All involved parties must ensure that the plan provided is appropriate given the constraints of the operation. Given optimal conditions as well as time and resources available, a complete salvage plan will include the elements listed below. When evaluating a salvage plan, it is essential to rely upon the resources available to an IC or UC for these particular incidents. The two major public resources are the USCG's SERT and the Navy's SUPSALV. Information on these resources and their contact information are provided in [Section 8370](#).

#### Elements of a Salvage Plan

| All Incidents |                                                                                      |
|---------------|--------------------------------------------------------------------------------------|
|               | Pre-incident drafts fore and aft                                                     |
|               | Cargo listing / volume                                                               |
|               | Fuel volume                                                                          |
|               | Status of vessel propulsion and steering systems                                     |
|               | Post casualty drafts                                                                 |
|               | Contingency planning identifying possible failure points                             |
|               | Lightering considerations                                                            |
|               | Clear understanding or contractual agreement of responsibility for control of vessel |
|               | Strength of hull girder, damaged areas, attachment points, and rigging               |
|               | Booming considerations                                                               |
|               | Means for controlling interference between pollution response and salvage efforts    |
|               | Potential pollution risks and precautions to avoid or minimize impact                |
|               | Communications plan                                                                  |
|               | Anticipated start time and predicted tides, currents, weather                        |
| Grounding     |                                                                                      |
|               | Post casualty drafts/locations/soundings                                             |
|               | Bottom type                                                                          |
|               | Estimated ground reaction                                                            |
|               | Force-to-free                                                                        |
|               | Towing assets available/utilized and horse power of each                             |
|               | Predicted stability when re-floated                                                  |
|               | A summary of the engineering rationale for retraction & refloating techniques        |
|               | Tow/rigging plan including attachment points                                         |
| Lightering    |                                                                                      |
|               | Volume of cargo/fuel to be lightered                                                 |
|               | Type of cargo to be lightered                                                        |
|               | Identification of compatible receiving facilities                                    |
|               | Special procedures to handle hazardous cargo/materials                               |
| Flooding      |                                                                                      |
|               | Identification and listing of all dewatering systems to be employed                  |
|               | Order of dewatering to ensure satisfactory stability of vessel                       |
| Transit Plan  |                                                                                      |
|               | Identification of transit route and final destination                                |
|               | Means for controlling the vessel as it is freed                                      |
|               | Route identified, with special attention to increased draft and beaching areas       |
|               | Vessel escorts, if any, to be employed and horse power of each                       |
|               | Any preparation of vessel necessary to gain permission for entry into destination    |

## **8370 – Resources**

### **8370.1 – General**

In addition to mobilizing unit investigators, inspectors, and responders, the first calls of a response should include contact with these resources. The missions of these resources are explicitly to assist Incident Commanders and on-scene response personnel in addressing matters of vessel salvage. In the table provided below, a number one indicates the best-suited resource, while a two indicates a capable, though secondary resource. It is important to note that employing either a commercial salvor or Navy SUPSALV will require a funding source.

|                         | Commercial Salvor | SERT Team* | Strike Team* | Navy SUPSALV |
|-------------------------|-------------------|------------|--------------|--------------|
| Vessel Assessment       | 1                 | 2          |              | 2            |
| Pollution Assessment    | 2                 |            | 1            |              |
| Salvor Equipment        | 1                 |            | 2            | 1            |
| Salvage Plan Assessment |                   | 1          |              | 2            |

\* USCG teams will provide services to a USCG unit at no cost.

#### *8370.1.1 - Marine Safety Center Salvage Emergency Response Team*

**Contact numbers: (202) 327-3985 (24 hours) or via the USCG Command Center at (800) 323-7233 (24 hours).**

The Marine Safety Center Salvage Emergency Response Team (SERT) is on call to provide immediate salvage engineering support to the USCG Captains of the Port (COTP) and Federal On-Scene Coordinators (FOSC) in response to a variety of vessel casualties. Specifically, SERT can assist the COTP and FOSC manage and minimize the risk to people, the environment, and property when responding to vessels that have experienced a casualty. SERT provides this assistance by performing numerous technical evaluations including: assessment and analysis of intact and damaged stability, hull stress and strength, grounding and freeing forces, prediction of oil/hazardous substance outflow, and expertise on passenger vessel construction, fire protection, and safety.

SERT has mobile computing capability for on-scene deployment. The MSC maintains a database containing over 5,000 hull files that can be used to generate computer models of vessels used in salvage engineering. External relationships with organizations like the Navy Supervisor of Salvage (SUPSALV), USCG Intel Coordination Center, and the Office of Naval Intelligence (ONI), as well as all major class societies, enable the salvage team to quickly locate and transfer information about a damaged vessel that would otherwise be difficult to access.

When requesting SERT assistance, [the Rapid Salvage Survey Form](#), which contains the minimum essential casualty details, should be used.

#### *8370.1.2 - USCG Strike Teams*

**National Strike Force Coordination Center: (252)-267-3458 (24 Hours)**

The National Strike Force (NSF) was established in 1973 as a direct result of the Federal Water Pollution Control Act of 1972. The NSF's mission is to provide highly trained, experienced personnel and specialized equipment to USCG and other federal agencies to facilitate preparedness and response to oil and hazardous substance pollution incidents in order to protect public health and the environment. The NSF's area of responsibility covers all USCG Districts and Federal Response Regions.

The strike teams provide rapid response support in incident management, site safety, contractor performance monitoring, resource documentation, response strategies, hazard assessment, oil spill dispersant and operational effectiveness monitoring, and high capacity lightering and offshore skimming capabilities

#### *8370.1.3 - NAVSEA Supervisor of Salvage and Diving*

**(202) 781-3889 (24 HOURS)** - The Office of the Director of Ocean Engineering, Supervisor of Salvage and Diving (SUPSALV), is a component of the Naval Sea Systems Command (NAVSEA). SUPSALV is located at the Washington Navy Yard in Washington, DC. SUPSALV is responsible for all aspects of ocean engineering, including salvage, in-water ship repair, contracting, towing, diving safety, and equipment maintenance and procurement.

The Salvage Operations Division maintains standing worldwide commercial contracts for salvage, emergency towing, deep ocean search and recovery operations, and oil pollution abatement. Additionally, they own, maintain and operate the worldwide Emergency Ship Salvage Material (ESSM) system, which incorporates the world's largest standby inventory of salvage and pollution abatement equipment. They also own, maintain, and operate a large number of deep ocean search and recovery systems, with depth capabilities up to 20,000 feet. They also routinely provide salvage technical assistance to fleet salvors, as well as to other federal agencies.

Within the National Oil and Hazardous Substance Pollution Contingency Plan, SUPSALV has been assigned as one of seven "Special Teams" available to the Federal On-Scene Coordinator (FOSC). Thus, they provide assistance (personnel and/or equipment) for commercial oil or hazardous substance spills, or potential spills (i.e., salvage operations), as requested by any FOSC. Assistance ranges from salvage technical or operational assistance to mobilization of SUPSALV and other Navy resources to support a partial or full federal response to a marine casualty. Be aware, however, these services are provided on a reimbursable basis only – they are not free.

#### *8370.1.4 - American Salvage Association*

**(703) 373-2267** - Leading U.S. salvors have formed the American Salvage Association (ASA). Created in response to the need for providing an identity and assisting in the professionalizing of the U.S. marine salvage and firefighting response, the intention of the ASA is to professionalize and improve marine casualty response in U.S. coastal and inland waters. The American Salvage Association meets with various federal and state agencies to exchange views on the improvement of salvage and firefighting response in the U.S.

### **8370.2 – Aleutians**

#### **Salvage Companies**

| Salvage & Diving Companies                             | Location     | Phone Number | BOA? | Capabilities                             |
|--------------------------------------------------------|--------------|--------------|------|------------------------------------------|
| Resolve-Magone Marine Services<br>www.magonemarine.com | Dutch Harbor | 581-1400     | Yes  | Diving, salvage, towing, support vessels |

#### **Current Marine Salvage Resources**

Currently there are four companies certified for the Western Alaska Captain of the Port Zone as primary resource provider that can enable vessel operators to comply with the Salvage and Marine Firefighting regulations (33 CFR 155, Subpart 1).

These four companies are listed in the USCG's Homeport page and are:

- Marine Response Alliance
- Donjon-Smit
- Resolve Marine Group
- T&T Salvage

There is also one resident salvage company based in Dutch Harbor. In 2013, the national Resolve Marine Group partnered with the 35 year-old Magone Marine Service, Inc.

Based on available subcontractor equipment and asset lists, the four primary resource providers draw from the same pool of subcontractors in Alaska and the Lower 48. For instance, the Dutch Harbor resident tugs operated by Dunlap Towing and Harley Marine Services are listed as subcontractors for towing service with both the Marine Response Alliance and Resolve Marine Group per those companies' websites. Although each company has their own salvage masters and some limited proprietary equipment in Alaska, a vast majority of their equipment is located in the continental United States. To provide the required capabilities in Alaska, the primary resource providers have established networks and contracts with other companies, as subcontractor support. This support ranges from a list of resident and transient tugs, fire suppression materials and pumps, commercial diving and other salvage equipment.

#### **Storage Barge:**

Adequate oil storage (whether from cargo or bunkers) is necessary to support lightering operations as well as secondary storage for oil spill response. Resolve Marine has staged a 21,500 bbl. oil recovery barge in Dutch Harbor. This in-region barge represents a significant increase in storage for lightering, spill response, and would be able to mobilize to support activities in different parts of the region.

Other in-region assets include tank trucks, vacuum trucks, drums and portable skid tanks, which are not well suited to lightering operations. There are two dedicated oil storage barges with a capacity of 249 bbl. each, which are owned by the Alaska Chadux. In addition, Alaska Chadux has two 59-bbl towable bladders and could cascade more oil storage devices if needed. There is also a heavy-lift barge based in Dutch Harbor. Other dedicated response barges are based in Cook Inlet and Prince William Sound, and would take days to arrive even in Unalaska, or longer to reach the Western Aleutian Islands assuming that barges could be released from local obligations and the weather was conducive to transit:

Cook Inlet: CISPRI Barge 141 (operated by Ocean Marine Services) would take just over 3 days to travel at 9 knots the approximately 700 nm from Nikiski to Unalaska. It has a capacity of 69,411 bbl. (CISPRI, 2010)

Prince William Sound: SERVS keeps several barges, with capacities up to 104,791 bbl. in Valdez (APSC, 2013). A barge would take approximately 4 days to travel approximately 850 nm at 9 knots from Valdez to Unalaska.

#### **8370.3 – Bristol Bay**

| Salvage & Diving Companies | Location | Phone         | BOA? | Capabilities       |

#### **8370.6 – North Slope**

Currently, there are no salvage and diving or towing companies in the North Slope Geographic Zone.

#### **8370.7 – Northwest Arctic**

There are no large-scale salvage companies for the Northwest Arctic Geographic Zone. There are no marine towing companies available in the Northwest Arctic Geographic Zone.

#### **8370.8 – Western Alaska**

Currently, there are no salvage and diving or towing companies in the Western Alaska Geographic Zone

**9100 – EMERGENCY NOTIFICATION****9110 – Initial Awareness, Assessment & Notification Sequence**

In the case of a *reportable* oil or hazardous substance spill (as defined in State and federal regulations), the Responsible Party (RP) or initial responder to the spill incident will immediately notify the following agencies. Once these initial notifications have been made, the Federal On-Scene Coordinator (FOSC), State On-Scene Coordinator (SOSC) and Local On-Scene Coordinator (LOSC) respectively, will be responsible for the notification of appropriate federal, state, and local agencies and organizations according to the contact lists contained on the following pages.

It is the responsibility of both the LOSC and SOSC to initiate contact with the appropriate local government agencies and organizations once initial emergency notifications have been made. Local plans may designate who will serve as the LOSC, who has responsibility for making any necessary contacts, and who should be contacted. Each distinct town, village, or community within larger jurisdictions, such as boroughs, may have their own emergency response plan, and all applicable local plans should be consulted during an emergency.

**Initial Emergency Contact Checklist**

| FEDERAL                                                                  |                            |

Alaska Department of  
Environmental Conservation  
Division of Spill Prevention and Response  
[www.dec.alaska.gov/spar/spillreport.htm](http://www.dec.alaska.gov/spar/spillreport.htm)

### Hazardous Substance

Any hazardous substance spill, other than oil, must be reported immediately.

### Oil – Petroleum Products

#### To Water

- Any amount spilled to water must be reported immediately.

#### To Land

- Spills in **excess of 55 gallons** must be reported immediately.
- Spills in **excess of 10 gallons, but 55 gallons or less**, must be reported within 48 hours after the person has knowledge of the spill.
- Spills of **1 to 10 gallons** must be recorded in a spill reporting log submitted to ADEC each month.

#### To Impermeable Secondary Containment Areas

- Any spills in **excess of 55 gallons** must be reported within 48 hours.

### Additional Requirements for Regulated Underground Storage Tank Facilities

Regulated Underground Storage Tank (UST) facilities are defined at 18 AAC 78.005 and do not include heating oil tanks.

If your release detection system indicates a possible discharge, or if you notice unusual operating conditions that might indicate a release, you must notify the ADEC UST Program within 7 days.

**UST Program: (907) 269-3055 or 269-7679**

rev. Feb./2013

## 9200 – PERSONNEL AND SERVICES DIRECTORY

### 9210 – Federal Resources/Agencies

It is the responsibility of the FOSC to initiate contact, as appropriate, with the following agencies, organizations, and entities once emergency notifications have been made. This is not an exhaustive list of federal contacts, and the FOSC may notify additional parties. Phone numbers are not listed in order of importance, and contacts will be made at the discretion of the FOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., POLREPs or other information) by fax or e-mail whenever possible.

### NATIONAL WEATHER SERVICE – OFFICE TELEPHONE NUMBERS

Marine weather forecasts and warnings, when issued, can be obtained by telephone as follows:

#### 24 Hours Daily (Recorded Telephone Marine Forecasts)

| Location  | Phone Number | Hours |
|-----------|--------------|-------|
| Anchorage | 936-2727     |       |
| Kodiak    | 487-4949     |       |

#### Other Office Numbers

|             |          |                    |
|-------------|----------|--------------------|
| Anchorage   | 271-5106 | 24 hours daily     |
| Cold Bay    | 532-2448 | 24 hours daily     |
| Homer       | 235-8588 | 10 pm - 6 am daily |
| King Salmon | 246-3303 | 10 am - 6 pm daily |
| Kodiak      | 487-4313 | 6 am - 6 pm daily  |
| Kotzebue    | 442-3231 | 12 am - 4 pm daily |
| Nome        | 443-2321 | 24 hours daily     |
| Saint Paul  | 546-2215 | 12 am - 5 pm daily |

### 9210.1 – Trustees for Natural Resources

A copy of the natural resource trustee emergency contacts is maintained on the Alaska Regional Response Team website, under “Members and Contacts” at <http://www.alaskarrt.org>

### 9210.2 – USCG

Over 1200 personnel are permanently assigned to 42 USCG units throughout Alaska. These personnel operate resources and perform many duties related to maritime safety and security as well as internal administration. As outlined in COMDTINST 16165.41, the resources of districts are available to the FOSC during a pollution response as the District Response Group (DRG).

Airports Accessible by C-130: There are approximately 100 or more airports in the State of Alaska that are accessible by USCG and other military C-130 aircraft. Since airport information is updated on a frequent basis, rather than list the airports and specific information on each airport, the following website is provided for specific information regarding airports that may be used to support an oil or hazardous substance spill response. <http://www.dot.state.ak.us/stwdav/AirportList.shtml#central>

| Agency                          | Phone        | Alt. Phone   | Fax                            |

| USCG Pacific Strike Team        | 415-883-3311 | 415-559-9908 | 415-883-7814                   |
| National Strike Force           | 252-331-6000 |              | 252-331-6012                   |

#### 9210.2.1 – USCG National Strike Force (NSF)

The National Strike Force (NSF) was created in 1973 as a USCG “Special Team” under the National Oil and Hazardous Substances Pollution Control Plan (National Contingency Plan). The NSF was designed to support the USCG, Environmental Protection Agency (EPA), and Department of Defense (DoD) pre-designated Federal On-Scene Coordinators (FOSCs) in their preparedness and response duties including responding to potential and actual oil and hazardous material spills and weapons of mass destruction incidents as directed by the National Contingency Plan (NCP). The NSF is composed of four units: the National Strike Force Coordination Center (Elizabeth City, NC), the Atlantic Strike Team (Fort Dix, NJ), the Gulf Strike Team (Mobile, AL), and the Pacific Strike Team (Novato, CA). The USCG National Strike Force

Coordination Center (NSFCC) coordinates the three USCG Strike Teams and the Public Information Assist Team (PIAT). The NSFCC also carries out several national preparedness missions directly supporting FOSCs. Each FOSC has a specific Strike Team designated for initial contact and may contact that team directly for any assistance. A FOSC may directly request PIAT assistance by contacting the NSFCC or any Strike Team.

#### **Contact Numbers**

| Novato, CA 94949-5082    | (415) 559-9405 OOD |

To request National Strike Force assistance, contact your servicing Strike Team at the number listed above; or the NSFCC at 252-331-6000 (after hours through the CDO at 252-267-3458); or the National Response Center at 800-424-8802. National Strike Force website: <https://www.dco.uscg.mil/Our-Organization/National-Strike-Force/>

#### **NATIONAL STRIKE FORCE CAPABILITIES**

- Respond with trained personnel and specialized equipment to prevent, contain and/or remove spills of oil and releases of hazardous material;
- Provide spill management expertise;
- Provide guidance for preplanning and response to weapons of mass destruction incidents;
- Assist with response planning and consultation;
- Conduct operational training in oil and chemical spill response techniques and equipment usage;
- Participate with the response, coordination, control and evaluation of National Preparedness for Response Exercise Program (PREP) training and exercises;
- Technical assistance, equipment and personnel to augment the FOSC staff during incident response;
- Identify, locate, and assist in the transportation of specialized equipment needed for any type of response;
- Provide support from the Public Information Assist Team (PIAT) to FOSCs during incident responses or exercise training;
- Assist in coordinating the use of private and public resources in support of the FOSC during a response to or a threat of a worst-case incident;
- Review Area Contingency Plans (ACP), including evaluation of equipment readiness and coordination among responsible public agencies and private organizations;

- Assist in location of spill response resources for both response and planning, using the DOG NSFCC's national and international computerized inventory of spill response resources in the Response Resource Inventory (RRI) data base which includes the OSRO/PAV programs;
- Inspection of district pre-positioned pollution response equipment.

#### **REQUESTING STRIKE TEAM ASSISTANCE**

- Requesting assistance from any one Strike Team, an FOSC immediately gains access to the entire NSF personnel roster and equipment inventory.
- FOSCs are encouraged to contact the NSF when:
  - Control of the discharge requires the special knowledge or special equipment of the NSF;
  - Response will require in excess of two days to complete removal operations and augmentation by NSF personnel will release local forces to return to normal operations;
  - Responsible Party (RP) has not or will not assume control immediately of the incident and the FOSC needs an immediate response to protect the environment and or the public;
  - In the judgment of the FOSC, NSF capabilities are necessary;
  - Technical assistance, equipment and other resources to augment the FOSC staff during incident response or exercise training;
  - Deployment of the district prepositioned pollution equipment (VOSS) or USCG SORS equipped vessel response is needed.

#### **STRIKE TEAM DEPLOYMENT**

Upon receiving a request, personnel and equipment will be deployed to the scene in the most expeditious manner possible. Each team maintains a state of readiness, which enables them to rapidly mobilize personnel and response equipment. Strike Team response equipment is palletized, loaded, and ready for immediate deployment by truck or aircraft.

Each Strike Team is capable of dispatching responders by the fastest means possible adhering to the NSF's minimum response time criteria as the circumstances of the incident dictate:

- Mobilizing four members within 2 hours of notification
- Mobilizing eight members within 6 hours of notification
- Mobilizing heavy equipment loads within 6 hours of notification
- Additional Strike Team personnel and equipment can be mobilized within 24 hours of notification

#### **STRIKE TEAM FUNDING**

For responses, Strike Team personnel require travel orders or travel accounting information prior to deployment. Funding typically comes from the pollution response fund (Federal Pollution Number, CERCLA Pollution Number, and Disaster Pollution Number). If no pollution response fund has been accessed, the requesting unit must provide funding.

Requests for training and exercise support that are associated with PREP are generally funded through the Deployable Operations Group (exercises included in the MTEP process); however, under some circumstances, the requesting unit may be required to provide funding.

Non-PREP training and exercise support requests originating from a Federal agency, including the USCG, shall be funded by the requesting agency or unit. Under most circumstances, State, County, and Municipal level-agencies will not be expected to provide funding.

#### **TRANSPORTATION**

Mobilization of Strike Team equipment may involve over-the-road transport: all three Strike Teams have tractor-trailer rigs that give them rapid deployment capabilities.

Aviation support is often needed during an emergency response to rapidly transport Strike Team equipment and/or personnel to the incident. When a Strike Team is requested by a FOSC/Sector Commander for assistance, the need/requirements for aviation support should be discussed. Requests for aviation support are the responsibility of the FOSC/Sector Commander. If aviation support is needed for an emergency response, the Sector should request the appropriate aviation support to Area through the District. The Strike Team can engage directly with the applicable Sector/Air Station to coordinate the aviation support requirements while the request is being processed through the District and Area.

*NOTE: Since response support is time critical, early notification of Strike Team assistance (or potential assistance) will allow the teams to begin logistics planning even before a formal request is made.*

### **LOGISTIC CONSIDERATIONS**

Strike Teams make every effort to be logistically independent; however, assistance may be required from the FOSC in arranging the following support:

- Heavy lifting equipment, such as cranes and forklifts capable of handling a 16,000 lb. containment barrier box;
- Fork extensions for forklift;
- Small boats, vessels of opportunity;
- Tractor-Trailer rigs;
- Electrical power, land lines for telephones and computers,
- Local logistics @staging areas, docks, boat ramps, weather conditions, etc.
- Potable water supply and fuel supply for command posts.

Specific logistic needs will be clarified during the initial request for assistance; these needs vary, dependent upon the incident and location. Strike Teams attempt to minimize the effort by the FOSC's staff required to arrange support. However, the local knowledge of the FOSC's staff may be relied upon by the Strike Teams to make reasonable decisions regarding logistics.

#### *9210.2.2 – USCG District Response Assist Team (DRAT)*

The USCG District Response Group (DRG) is a framework within each USCG District to organize district resources and assets to support USCG FOSCs during a response to a pollution incident. DRGs assist the FOSC by providing technical assistance, personnel, and equipment, including the USCG's pre-positioned equipment. Each DRG consists of all USCG personnel and equipment within the district, including the District Response Advisory Team (DRAT), which is available to provide support to the FOSC in the event a spill exceeds local response capabilities. The DRAT has personnel specifically trained in pollution fund management, equipment, and environmental assessment.

#### *9210.2.3 – Public Information Assist Team (PIAT)*

The Public Information Assist Team (PIAT) is an element of the National Strike Force, co-located with the National Strike Force Coordination Center and is available to Federal On-Scene Coordinators. Four highly trained crisis communications professionals staff the team. The PIAT's primary function is to provide the gamut of emergency public information services during oil spills and hazardous material releases – the team also provides these services for natural disasters, domestic terrorism events and weapons of mass

destruction events. Team members routinely act as the Public Information Officer for USCG and Environmental Protection Agency officials responsible for mitigating oil and hazardous material incidents.

Team personnel also teach risk communication and media relations techniques, as well as ICS-based Joint Information Center organization and Public Information Officer operations to response community personnel from the USCG, other federal agencies, state and local agencies and industry. Additionally, the PIAT assists in the scenario development of USCG pollution response exercises and participates as evaluators or controllers during federal- and industry-led exercises.

To request the Public Information Assist Team, contact the NSFCC at 252-331-6000, or after hours through the CDO at 252-267-3458, or the NRC at 800-424-8802.

PIAT website: <http://www.uscg.mil/hq/nsfweb/piat/piatindex.html>

#### **PIAT DEPLOYMENT**

Upon receiving a request, PIAT's goal is to deploy two (2) personnel and one (1) response kit within six hours of notification, and an additional two (2) personnel within 24 hours, if necessary. All NSF members, including PIAT, deploy for a maximum of 21 days at a time.

#### **PIAT FUNDING**

For responses, PIAT requires travel orders or travel accounting information prior to deployment. Funding typically comes from the pollution response fund. If no pollution response fund has been accessed, funding will come from the requesting unit.

Requests for training and exercise support that are associated with PREP are generally funded through the Deployable Operations Group; however, under some circumstances, the requesting unit may be required to provide funding.

Non-PREP training and exercise support requests originating from a Federal agency, including the USCG, shall be funded by the requesting agency or unit. Under most circumstances, State, County, and Municipal level-agencies will not be expected to provide funding.

*9210.2.4 – USCG Reserve - TBD*

*9210.2.5 – USCG Auxiliary - TBD*

#### **9210.3 – Environmental Protection Agency (EPA)**

| Agency                                      | Phone        | Alt. Phone | Fax      |
|---------------------------------------------|--------------|------------|----------|
| Environmental Protection Agency – Anchorage | 271-5083     |            | 271-3424 |
| Seattle (24 hr.)                            | 206-553-1263 |            |          |

##### *9210.3.1 – Environmental Response Team (ERT)*

The EPA's **Environmental Response Team (ERT)** has expertise in treatment, biology, chemistry, hydrology, geology, and engineering. The ERT can provide the FOSC access to special equipment to deal with chemical releases. The ERT can also provide the FOSC with advice concerning the following:

- hazard evaluation,
- multimedia sampling and analysis,
- risk assessment,

- on site safety,
- cleanup techniques,
- water supply decontamination and protection,
- use of dispersants,
- environmental assessment,
- degree of cleanup required, and
- Disposal of contaminated materials.

The ERT offers various training courses to prepare response personnel. The EPA ERT teams are located in Edison, NJ; Cincinnati, OH; and Las Vegas, NV.

#### *9210.3.2 – Radiological Emergency Response Team (RERT)*

The **Radiological Emergency Response Team (RERT)** coordinates or assists federal, State, tribal, and local response efforts before, during, and following a radiological incident. There are RERT personnel at the two EPA National Radiation Laboratories in Montgomery, Alabama and Las Vegas, Nevada, as well as at the EPA's regional offices and national headquarters. RERT can provide the support in the following areas:

- technical advice and assistance to prevent or minimize threats to public health and the environment; advice on protective measures to ensure public health and safety;
- assessments of any release for dose and impact to public health and the environment;
- monitoring, sampling, laboratory analyses and data assessments to assess and characterize environmental impact (Staff from EPA's National Air and Radiation Environmental Laboratory and its Radiation and Indoor Environments National Laboratory provide monitoring and assessment services both at the labs and at the response site, if needed.); and
- Technical advice and assistance for containment, cleanup, restoration, and recovery following a radiological incident.

#### *9210.3.3 – National Decontamination Team (NDT)*

The **National Decontamination Team (NDT)**, located in Cincinnati, Ohio, provides expertise and support to On-Scene Coordinators regarding the decontamination of buildings or other structures in the event of an incident involving releases of radiological, biological, or chemical contaminants.

#### **9210.4 – National Oceanic and Atmospheric Administration (NOAA)**

| Agency                                    | Phone    | Alt. Phone | Fax      |
|-------------------------------------------|----------|------------|----------|
| National Oceanic & Atmospheric Admin. SSC | 428-4143 |            | 271-3139 |

#### *9210.4.1 – Scientific Support Coordinator (SSC)*

NOAA Scientific Support Coordinators (SSC) are the principal advisors to the USCG FOSC for scientific issues, communication with the scientific community, and coordination of requests for assistance from State and federal agencies regarding scientific studies. The SSC strives for a consensus on scientific issues affecting the response, but ensures that differing opinions are communicated to the FOSC. At the request of the FOSC, the SSC leads the scientific team during a response and is responsible for providing scientific support for operational decisions and for coordinating on-scene scientific activity. The SSC leads the synthesis and integration of environmental information required for spill response decisions in support of the FOSC, while coordinating with State representatives, appropriate trustees and other knowledgeable local representatives. The SSC is supported by a scientific support team that includes expertise in environmental chemistry, oil slick tracking, pollutant transport modeling, and natural resources at risk, environmental tradeoffs of countermeasures and cleanup, and information management. At the request

of the FOSC, the NOAA SSC may facilitate the FOSC's work with the lead administrative trustee for natural resources to ensure coordination between damage assessment data collection efforts and data collected in support of response operations.

*9210.4.2 – Discharge & Release Trajectory Modeling - TBD*

*9210.4.3 – Oceanic & Atmospheric Modeling - TBD*

#### **9210.5 – U.S. Navy Supervisor of Diving and Salvage (SUPSALV)**

| Agency            | Phone    | Alt. Phone | Fax      |
|-------------------|----------|------------|----------|
| U.S. Navy SUPSALV | 384-2968 | 384-7613   | 384-2969 |

The US Navy is the federal agency most knowledgeable and experienced in ship salvage, shipboard damage control, and diving. The US Navy has an extensive array of specialized equipment and personnel available for use in these areas as well as in specialized oil containment, collection, and removal equipment.

The Supervisor of Salvage (SUPSALV) can provide salvage expertise and maintains a warehouse on each US coast stockpiled with salvage and response gear. A request for US Navy assistance is made through the FOSC or the RRT.

#### **9210.6 – Agency for Toxic Substance and Diseases (ATSDR)**

The Agency for Toxic Substance and Disease Registry (ATSDR):

- maintains appropriate disease/exposure registries;
- provides medical care and testing of individuals during public health emergencies;
- develops, maintains, and informs the public concerning the effects of toxic substances;
- maintains a list of restricted or closed areas due to contamination;
- conducts research examining the relationship between exposure and illness; and
- Conducts health assessments at contaminated sites.

Additionally, the ATSDR assists the EPA in identifying most hazardous substances at CERCLA sites, develops guidelines for toxicological profiles of hazardous substances, and develops educational materials related to the health effects of toxic substances. ATSDR resources are an important tool for the FOSC to use in assessing the possible effects of an environmental emergency on the public's health.

The Agency's 24-hour telephone number is **(404) 639-0615**.

#### **9210.7 – Civil Support Teams - TBD**

#### **9210.8 – Bureau of Ocean Energy Management and Regulation Enforcement - TBD**

#### **9220 – State Resources/Agencies**

It is the responsibility of the SOSC to initiate contact, as appropriate, with the following agencies and organizations once emergency notifications have been made. This is not an exhaustive list of State contacts, and the SOSC may notify additional parties. Phone numbers are not listed in order of importance and contacts will be made at the discretion of the SOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., a sitrep or other information) by fax or e-mail whenever possible.

| Agencies                                                                        | Phone          | Alt. Phone             | Fax      |

**9220.1 – Government Official Liaisons - TBD**

**9220.2 – Alaska Department of Natural Resources**

*9220.2.1 – State Historic Preservation Office (SHPO)*

Guidelines about how to ensure that preparedness and emergency response activities take historic properties protection into account is provided in the *Alaska Implementation Guidelines for Federal On-Scene Coordinators for the Programmatic Agreement on Protection of Historic Properties during Emergency Response under the National Oil and Hazardous Substances Pollution Contingency Plan*. This document is found in the Regional Contingency Plan.

Consistent with the guidelines, questions about historic properties preparedness and response activities should be directed to:

|                                                                                  |          |

#### *9250.1.1 – Basic Ordering Agreement (BOA)*

**USCG Basic Ordering Agreement (BOA) Contractors:** The USCG has authority to access civilian equipment, personnel and services under a Basic Ordering Agreement. The most current civilian contractors list can be found on the USCG Portal, [here](#).

| <b>CONTRACTING OFFICERS for USCG 17<sup>TH</sup> DISTRICT: ALASKA</b> |                   |
|-----------------------------------------------------------------------|-------------------|
| Primary Contact                                                       | (510) 437-3009    |
| Alternate Contact                                                     | (510) 437-3235    |
| Chief of Contracting                                                  | (757) 628-4114    |
| D17 DRAT/MEP:                                                         | 463-2247          |
| Sector ANCHORAGE PO:                                                  | 957-0159/957-1688 |

**EPA BOA Contractors:** Contact the EPA FOSC for a list of BOA contractors.

**State Term Contractors:** ADEC maintains Term Contracts with several companies and consulting firms for providing needed expertise and assistance during responses to oils spills and hazardous substance releases. These contracts can be activated by the issuance of a Notice to Proceed by the ADEC Contract Manager or the SOSC. Contact the SOSC listing of the companies holding a Term Contract with the State of Alaska

#### *9250.1.2 – Non-BOA*

**Primary Response Action Contractors (RAC) and Oil Spill Response Organizations (OSRO):** Primary Response Action Contractors (RAC) and Oil Spill Response Organizations (OSRO) may play an important role in a spill response. Primary RACs and OSROs are organizations that may enter into a contractual agreement with an RP (vessel or facility owner/operator), assisting the RP in spill cleanup operations. RACs/OSROs can provide equipment, trained personnel and additional resources. The Operations/Technical Manuals maintained by the RACs/OSROs may be referenced in vessel or facility contingency plans and serve as supplementary reference documents during a response. OSROs generally have access to large inventories of spill equipment and personnel resources. The FOSC or SOSC may contract these assets for use. Complete equipment inventories are listed in the respective Operations/Technical Manuals of the RACs and OSROs.

Under State of Alaska statute, a nontank vessel is a self-propelled watercraft of more than 400 gross registered tons. Examples include: commercial fishing vessels, commercial fish processing vessels, passenger vessels and cargo vessels, but does not include a tank vessel, oil barge or public vessel. Owners of regulated nontank vessels are required to submit to ADEC an oil discharge prevention and contingency plan covering all applicable nontank vessels. A nontank vessel PRAC is an organization registered with the State of Alaska that is obligated under a contractual relationship with a contingency plan holder to provide personnel and/or equipment to contain, control, or clean up oil spills for the plan holder; a PRAC may be under contract to multiple plan holders. A nontank vessel cleanup contractor means an oil spill PRAC who is, or intends to be, obligated under contract or membership agreement to provide resources or equipment to contain, control, and perform cleanup of an oil discharge under an approved nontank vessel plan. A nontank vessel incident management team means an oil spill PRAC who is, or intends to be, obligated under contract to provide incident management services under an approved nontank vessel plan. A response planning facilitator is an oil spill PRAC who provides services to the holder of an approved nontank vessel plan and act as an intermediary between the plan holder and one or more nontank vessel

cleanup contractors and one or more nontank vessel incident management teams in order to facilitate the submission of a nontank vessel streamlined plan.

#### **9250.2 – Media**

Reference [Section 2330](#) of this document and [the Community Profiles](#).

#### **9250.3 – Fire Fighting/Salvage Companies/Divers**

Reference [Section 8370](#) for Salvage and Diving Companies.

#### **9250.4 – Fishing Cooperatives and Fleets**

The following list of fishing fleets/organizations was extracted from the National Fisherman’s Directory of Fishermen’s Organizations and Pacific States Marine Fisheries Commission websites:

There are no formal organized fishing fleets/organizations in the North Slope or Northwest Arctic Geographic Zones. Other geographic zones may be consulted for the listing of fishing organizations within their respective geographic zones. Generally, fishing groups and associations may be contacted with requests for specific information on the location and timing of fish, as well as local current conditions, and though the primary function of these organizations is not to provide such information, individual members will be quite knowledgeable about environmental conditions and may be willing to share information.

Subsistence hunting and fishing, rather than commercial endeavors, are the main activities of the North Slope and Western Alaska Geographic Zones. The Alaska Eskimo Whaling Commission serves to organize and promote whaling by the Inupiat and Siberian Yupik Eskimos living in the coastal villages in northern and western Alaska, a significant marine subsistence activity for many of the North Slope villages. Contact information is under Barrow in [Community Profiles](#). By contacting specific communities, one may be able to obtain specific information regarding local weather, river conditions and topographic features.

#### **9250.5 – Wildlife Rescue Organizations**

Questions regarding oiled or potentially oiled wildlife preparedness and response activities should be directed to:

## 9250.8 – Academic Institutions - TBD

## 9250.9 – Laboratories

**Disclaimer:** In providing this list does not guarantee the accuracy or validity of the data generated by these laboratories. A laboratory that is **certified** or **approved** has established that they have the ability to implement a quality control program in accordance with the appropriate federal or State regulations or

statutes. This list is updated every Tuesday by the ADEC Contaminated Sites Lab Approval Officer (907 465-5390). For the most up-to-date listing, visit the following website:

<http://dec.alaska.gov/spar/csp/LabApproval/ListOfApprovedLabs.htm>

When choosing a lab from the list, request the lab supply a copy of their current ADEC approval letter. These letters detail the methods *and matrices* for which the lab has approval. "Approved methods" does not imply approval for both water and soil samples. Labs must renew their approval and pass performance evaluation samples annually. Failure to do so results in the revocation of a lab's approval.

#### **9250.10 – Emergency Medical Services**

All medical resource information can be found in [Section 3350](#) of this document, or in [the Community Profiles](#).

#### **9260 – Stakeholders - TBD**

#### **9300 – DRAFT INCIDENT ACTION PLAN (IAP) - TBD**

#### **9400 – AREA PLANNING DOCUMENTATION**

#### **9410 – Discharge and Release History**

For discharge and release historic information, check the ADEC Prevention, Preparedness and Response Database: <http://dec.alaska.gov/Applications/SPAR/PublicMVC/PERP/SpillSearch>

#### **9420 – Risk Assessment/Planning Assumptions**

##### **9420.1 - Fate of Spilled Oil**

Natural processes that may act to reduce the severity of an oil spill or accelerate the decomposition of spilled oil are always at work in the aquatic environment. These natural processes include weathering, evaporation, oxidation, biodegradation, and emulsification.

- Weathering is a combination of chemical and physical processes that change the physical properties and composition of spilled oil. These processes include evaporation, oxidation, biodegradation, emulsification, dispersion, dissolution, and sedimentation. Below are definitions of these processes and how they relate to oil spills.
- Evaporation occurs when substances are converted from liquid state to vapor. During an oil spill, lighter components can evaporate into the atmosphere, leaving behind heavier components. Evaporation rates depend on the composition of the oil and environmental factors like wind, waves, temperature, currents, etc. For example, lighter refined products, such as gasoline, tend to evaporate very quickly because they have a higher proportion of lighter compounds. Heavier oils, like bunker oil, contain relatively few light compounds and leave viscous residues, composed of heavier compounds.
- Oxidation is a chemical reaction between two substances, which results in loss of electrons from one of the substances. This chemical reaction can take place between spilled oil and oxygen in the air or water. This reaction can produce water-soluble compounds that can dissolve or form persistent compounds call tars. Oxidation of oil is a very slow process but can be enhanced by sunlight.

- Biodegradation occurs when microorganisms, such as bacteria, fungi, and yeast, break down a substance by feeding on it. Seawater contains a range of microorganisms that either can partially or completely degrade oil. Nutrient levels, water temperature and oxygen availability can all affect biodegradation, which tends to be quicker in warmer environments.
- Emulsification is a process where small droplets of one liquid become suspended in another liquid. During a spill, emulsification takes place when strong currents or waves suspend water droplets in oil. Water-in-oil emulsions are frequently called "mousse" and are more persistent than the original oil.
- Dispersion is the break up and diffusion of substances from their original source. In an oil spill, turbulent seas can break oil into various sized droplets and mix them into the water column. Smaller droplets can stay suspended while larger droplets tend to resurface, creating a secondary slick. The amount of oil dispersed depends on the oil's chemical and physical properties and the sea state. For example, lower viscosity oils such as diesel, have higher dispersion rates in rough seas. Chemical dispersants may be used to enhance dispersion.
- Dissolution is the process of dissolving one substance in another. Many oils contain light aromatic hydrocarbons, like benzene and toluene, which are water-soluble. During a spill, these compounds readily dissolve in water or evaporate into air, which is faster than dissolution.
- Sedimentation is a process where spilled oil chemically binds with, or adheres to, particulates in the water column, creating a density greater than the original oil. If the density of oil/particulate compounds becomes greater than water, particles will settle out of the water column. Sedimentation is much more common in shallow, nearshore areas because of the greater amount of suspended particulates.

The various types of petroleum products respond quite differently when released into the environment. Spills of refined product that enter the water generally will disperse and experience significant evaporation and spreading, making recovery difficult. Crude oil and Intermediate Fuel Oils (bunker fuel) will be affected by the same natural degradation factors but to a much lesser degree; these oil spills are "persistent" in nature and will require aggressive actions and innovative techniques to successfully mitigate harm.

## **9500 – LIST OF AGREEMENTS**

Reference the Regional Contingency Plan – Applicable Memorandum of Understanding/Agreements (MOU/MOA). The MOUs/MOAs are also on the [ADEC website](#).

## **9600 – CONVERSIONS - TBD**

## **9700 – RESPONSE REFERENCES**

### **9710 – Relevant Statute/Regulations/Authorities List**

#### **9710.1 – Federal Authorities**

OPA 90, section 4202 amended Subsection (j) of Section 311 of the Federal Water Pollution Control Act (FWPCA; 33 U.S.C. 1321 (j)) to address National Planning and Response System development. As part of this system, Area Committees are to be established for each area designated by the President. These Area Committees are to be comprised of personnel from federal, state, and local agencies. Each Area Committee, under the direction of the Federal On-Scene Coordinator (FOSC) and State On-Scene Coordinator (SOSC) for the area, is responsible for developing an ACP, which when implemented in conjunction with the NCP, shall be adequate to remove a worst case discharge and mitigate or prevent a substantial threat of such discharge from a vessel, offshore facility, or onshore facility operating in or near the geographical area. Each Area Committee is also responsible for working with state and local officials to preplan for joint response efforts, including designing appropriate procedures for mechanical recovery, chemical dispersal, shoreline cleanup, protection of sensitive environmental areas, and protection, rescue, and rehabilitation of fisheries and wildlife. The Area Committee is also required to work with State and local officials to expedite decisions for the use of dispersants and other mitigating substances and devices.

The functions of designating areas, appointing Area Committee members, determining the information to be included in ACPs, and reviewing and approving ACPs have been delegated by Executive Order 12777 of 22 October 1991 to the Commandant of the U.S. Coast Guard (through the Secretary of Transportation) for the coastal zone and to the Administrator of the Environmental Protection Agency for the inland zone. The term "coastal zone" is defined in the current NCP (40 CFR 300.5) to mean all United States waters subject to the tide, United States waters of the Great Lakes, specified ports and harbors on inland rivers,

the waters of the Exclusive Economic Zone (EEZ), and the land substrata, ground waters, and ambient air proximal to those waters. The term "inland zone" is defined in the current NCP to mean the environment inland of the Coastal Zone. These terms delineate an area of responsibility for response action. Precise boundaries are determined by existing federal and State agency memoranda of understanding/agreements (MOU/MOA).

In Volume 57, Federal Register Notice 15001 published on April 24, 1992, the EPA and USCG jointly announced the Designation of Areas and Area Committees under OPA for inland and coastal zones. Due to the split of jurisdiction and responsibilities between EPA and the USCG and the inherent differences in organizational structure of the two agencies, each agency took separate but compatible approaches in establishing initial designations. Nationwide, the EPA designated the existing 13 "RRT areas" as the initial areas for which ACPs must be prepared in the Inland Zone, while the USCG designated the coastal portions of the existing Captain of the Port (COTP) zones as the initial areas for which ACPs must be prepared in the Coastal Zone. In Alaska, this has the effect of initially establishing one statewide inland area by EPA and three coastal areas, corresponding to the boundaries of the three USCG COTP zones. Both EPA and USCG have authority to further subdivide initial Areas, both coastal and inland, into smaller, more localized areas for which ACPs can be developed.

Also, per the National Contingency Plan, the Department of Defense (DOD) and the Department of Energy (DOE) shall provide their own FOSCs, who will be responsible for taking all response actions to releases of hazardous substances, pollutants, or contaminants when the release is on, or the sole source of the release is from, any facility or vessel (including bareboat-chartered and operated vessels) under their jurisdiction, custody or control.

#### **9710.2 – State Authorities**

The State Oil and Hazardous Substance Discharge Prevention and Contingency Plan (State Master Plan) was prepared by the Alaska Department of Environmental Conservation (ADEC) as required by AS 46.04.200. The State Emergency Response Commission (SERC) reviews the plan as required by AS 26.23.077.

Under AS 46.03.020(10) (A), the ADEC is empowered to adopt regulations providing for the control, prevention, and abatement of all forms of pollution.

In 1980 legislation was enacted which defined the State's policies regarding oil spills. The purpose of this law is to provide for the safety and protection of human health and welfare of Alaskans from damage resulting from oil spills and to provide the ability to clean up a spill and restore damaged areas.

The Findings and Intent section of Chapter 116 SLA 1980 ("An Act relating to the prevention and control of oil pollution; and providing for an effective date") clearly sets forth state policy:

- It is a matter of the highest urgency and priority to protect Alaska's coastal and inside water, estuaries, wetlands, beaches and land from the damage which may be occasioned by the discharge of oil;
- The storage, transfer, transportation and offshore exploration for and production of oil within the jurisdiction of the State are hazardous undertakings; oil discharges may cause both short-term and long-term damage to the environment and the beauty of the state, to owners and users of affected property, to public and private recreation, to residents of the state and other interests deriving livelihood from fishing, hunting, tourism and related activities;

- Assuring sufficient capability, among industrial and commercial interests, and the State and federal governments, to contain and clean up discharges of oil is of vital public interest; weather conditions, logistic constraints and the relative paucity of labor and equipment resources in the state increase the difficulty of oil discharge containment and cleanup in Alaska, making imperative an active State role;

It is the policy of the State that, to the maximum extent practicable, prompt and adequate containment and cleanup of oil discharges is the responsibility of the discharger; it is therefore of the utmost importance to assure that those engaged in oil storage, transfer, transportation, exploration and production operations have sufficient resources and capabilities to respond to oil discharges, and to provide for compensation of third persons injured by those discharges; and

- The State should continue its cooperative relationships with appropriate federal agencies, protecting its legitimate interests while working to remove any duplicative or potentially conflicting regulatory activities.

*In 1989, legislation was enacted by the Alaska Legislature to further strengthen the State's capability to deal with oil spills:*

Findings and purpose:

- The Legislature finds that the March 24, 1989 oil spill disaster in Prince William Sound demonstrates a need for the State to have an independent spill containment and cleanup capability in the event of future discharges of oil or a hazardous substance.
- The purpose of this Act is to assure people of the state that their health, safety and well-being will be protected from adverse consequences of oil and hazardous substance releases that present grave and substantial threats to the State's economy and environment.

*In 1990, the law was revised again.* In order to meet the goal of protecting Alaska's people and environment, AS 46.04.200 set forth required Plan elements:

- To take into consideration the elements of an oil discharge contingency plan approved or submitted for approval under AS 46.04.030;
- To include an incident command system that clarifies and specifies responsibilities for State, federal, and municipal agencies, facility operators, and private parties whose property may be affected by a catastrophic oil and/or hazardous substance discharge;
- To identify actions necessary to reduce the likelihood of catastrophic oil discharges and significant discharges of hazardous substances.

Alaska Statutes, Sections 46.04.200-210 specify state requirements for Oil and Hazardous Substance Discharge and Prevention Contingency Plans. This RCP, along with the ACPs, were written with the goal that they would meet both federal and State planning requirements in Alaska.

#### **9720 – Relevant Instructions/Guidelines/Standard Procedures and Practices List**

The following are helpful resources for any response or exercise spanning numerous incident types and situations:

- [The USCG Incident Management Handbook](#)
- [The Alaska Incident Management System \(AIMS\) Guide for Oil and Hazardous Substance Response](#)
- [The Alaska Department of Environmental Conservation, Spill Tactics for Alaska Responders \(STAR\) Manual](#)

Note: None of these guides is specifically prescribed by this plan, and none is mandated for use by response plan holders or potential responsible parties. Federal and State On-Scene Coordinators will work with the response organization established by the responsible party in responding to and managing oil or hazardous substance releases as long as their organization is compatible with ICS principles

## **9730 – Geographic Zone Contingency Plans**

### **9730.1 – Aleutians**

#### *9730.1.1 – General Description*

Physical Features: The Aleutian Islands and the Alaska Peninsula are characterized by rugged and fjord-like coastlines rising to volcanic mountainous areas up to 9000 feet in elevation. The population is distributed among predominantly isolated coastal communities. Major communities include the cities of Unalaska, Sand Point, and St. Paul. The region's maritime climate is comparatively mild with regard to general Alaskan temperatures; however, the islands are often fog-shrouded and frequently struck by storms. The weather in the region is the result of the interaction between major weather systems that move northward across the Gulf of Alaska or eastward across the Bering Sea and the land topography.

Socio-Economic: Commercial fishing and fish processing are the economic mainstays in the region. There are approximately 400 fishing vessels operating in the Aleutian Island chain. Unalaska/Dutch Harbor has developed as a seafood supply and processing center with some port development. Unalaska is consistently the top U.S. port in volume of fish and shellfish landings; in 2005, commercial fishermen unloaded 887.6 million pounds of fish and shellfish, worth \$166 million.

Dutch Harbor is also used temporarily as an offshore oil/gas staging area for Bering Sea offshore exploration. There is some potential for offshore oil and gas development in the North Aleutian Basin.

A portion of the Great Circle Route, a major international shipping route, is located within the Aleutians Geographic zone. Estimated 3,000-3,500 vessels, approximately 30-40 of them tank ships, transit through Unimak Pass each year.

Oil Activities: In the Aleutians, Unalaska/Dutch Harbor serves as the major regional hub for the distribution of noncrude oils to the Aleutian villages, southern Bering Sea, and the offshore fishing fleet. Service in the southern part of the area is year round, but becomes ice dependent during late October to breakup. Unimak Pass and False Pass also witness heavy traffic both for transport servicing villages to the north and the Aleutian chain and for foreign-vessel transport between North America and the Far East.

Deliveries of noncrude oils into the Aleutians are from the south, primarily Puget Sound or from upper Cook Inlet. Noncrude oil originating from upper Cook Inlet and West Coast ports also passes through the area enroute to the Far East, and transport in the reverse direction is true.

General: There are 12 communities in the region, 10 Native and 2 non-Native.

#### *9730.1.2 – Local Contacts*

This list of local contacts is not exhaustive, and the LOSC may notify additional parties. Phone numbers are not listed in order of importance and contacts will be made at the discretion of the LOSC/SOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., sitreps or other information) by fax or e-mail whenever possible.

### 9730.1.3 – Logistics

Communities in the Aleutians Geographic zone are inaccessible by road. This limits the rapid transport and staging of equipment and personnel resources to certain areas. Depending upon the significance and location of the event, resources existing within the region will be moved to the staging location by air or marine vessel and then transferred to vessels for deployment to the specific spill location. Resources secured from locations outside of the Aleutians region can be expected to arrive initially by air or sea and then transferred to the staging locations by the most appropriate means available.

The Aleutians Geographic zone's limited road, water and air transportation capability severely limits the ability to transport significant quantities of equipment and personnel to and from locations in the region. After transport to existing airports, equipment may need to be transferred to vessels for on-scene deployment. Small charter aircraft, both fixed wing and helicopters, will be the main method of rapidly transporting responders to the scene. If weather prevents flying or if a large number of personnel are involved, then in-region passenger vessels will be used. Workers brought in from outside the region will most likely arrive on scheduled Alaska Airlines, PenAir flights or via chartered aircraft. These workers can then be shuttled to the scene by a combination of aircraft and vessels.

Response equipment can be dispatched to the scene by a combination of USCG and private charter aircraft and vessel transport. A limited number of fishing vessels operate in the region and these vessels are extremely dependent on pack ice conditions.

For transportation via air and water, the following table provides distance from Anchorage to some of the Aleutians communities. Times assume favorable weather and do not take into account delays waiting for favorable tides. Distances are from tables found in the back of *U.S. Coast Pilot, Volume 9 -Pacific and Arctic coasts of Alaska from Cape Spencer to the Beaufort Sea*. (Available on the internet at [chartmaker.ncd.noaa.gov/NSD/coastpilot.htm](http://chartmaker.ncd.noaa.gov/NSD/coastpilot.htm))

**Approximate Distance & Transit Times to Aleutian Communities**

| Location                | Distance   | Travel Time (Estimated in Hours) |             |
|-------------------------|------------|----------------------------------|-------------|
|                         |            | Vessel (~10 kts)                 | Air (C-130) |
| From City of Kodiak to: |            |                                  |             |
| Unalaska/Dutch Harbor   | 800 miles  | 96                               | 1.9         |
| From Anchorage to:      |            |                                  |             |
| Adak                    | 1300 miles | 108                              | 3.3         |
| Akutan                  | 766 miles  | 64                               | 1.8         |
| Atka                    | 1200 miles | 100                              | 2.9         |
| Cold Bay                | 634 miles  | 53                               | 1.3         |
| False Pass              | 646 miles  | 54                               | 1.4         |
| King Cove               | 625 miles  | 52                               | 1.3         |

#### *9730.1.4 – Marine Response and Salvage Supplemental*

##### **Response Times for Tugs of Opportunity**

Historically, there has not been a dedicated emergency tow vessel in the Aleutian Islands to assist a distressed ship. However, tugs of opportunity or tugs that are available in the region but not dedicated to rescue services may be able to aid a distressed ship if they were willing and able to divert their activities.

A study was conducted for the Aleutian Island Risk Assessment, which examined the amount of time it would take a potential tug of opportunity to reach six hypothetical incident locations and whether the tug would have sufficient bollard pull to control a large container ship once it reached the location (The Glosten Associates, 2013a and 2014). A supplemental study analyzed actual tug location data for a one-year time period and extrapolated the information to illustrate the availability and capability of towing vessels in service in the Geographic Zone to arrive on-scene and assist disabled vessels at the six scenario locations. Travel time estimates were derived from actual towing vessel locations based on a weekly sampling of AIS data in 2012.

Eighty-six tugs were included in the analysis, plus two additional vessels, which were treated as special cases: the USCG cutter Alex Haley and the tug Resolve Pioneer. For all scenarios, the tug most likely to reach a distressed vessel in the Aleutian Islands are located in the eastern Aleutians (near Dutch Harbor), or even farther east, near Kodiak or in Bristol Bay. Of the 86 tugs identified in the AIS data, 23 of them were not useful in any scenario because for each incident site, sea state, and week it was present; a more capable tug would have arrived first. Of the remaining tugs, most of them were useful only a handful of weeks, with only one tug, the James Dunlap showing up as a potential responder in more than 12 weeks.

Tug availability was not consistent for the one-year period analyzed. A fully functional tug with greater than 80 MT bollard pull was present in about half the weeks of the analysis. More tugs were available in late-July and August 2012; tugs with bollard pull greater than 100 MT were most available in July-August and again in November-December, but were rare during the rest of the year.

Even in extreme weather, a tug of opportunity could usually be expected to reach a distressed vessel within 12 hours near Unimak Pass, but a distressed vessel in the western Aleutian Islands area would likely wait two or more days for a tug of opportunity rescue. Adequate emergency towing assistance could be delayed or impossible in very stormy weather, especially if relatively large tugs were not available.

##### **Considerations for Rescue Tugs:**

As part of the Aleutian Islands Risk Assessment, it was required to identify the towing performance capacity required of a tug to handle existing vessels in the prevailing weather conditions. Two vessels were identified as being the largest typically found on routes passing close to the Aleutians; a 600,000 bbl. crude oil tanker and a 68,000 DWT container ship. The evaluation was run for a range of conditions that might be found in the Aleutians. Winds from 20 to 60 knots with sea states to match were examined. A 40-knot wind speed and its associated sea state 6 were used for specifying the minimum required bollard pull.

At higher wind speeds, the wind forces dominate the solution, which makes the container ship the limiting case for turning and arresting drift. The three operations are:

- Arresting drift; the tug force required to prevent the vessel from drifting down wind when it is beam to the wind and waves

- Turning; the tug force required to turn a drifting vessel into the wind and waves without towing crosswind to develop forward speed
- Towing; the tug force required to tow the ship to windward at 1 knot.

Because the forces on the vessel are greatly reduced with the bow pointed into the weather, the strategy for this analysis was to turn the vessel while allowing drift to leeward. As such, the required tug force would be the worst case of the turning or towing requirements. The simulations show less tug force required than the analysis. For scenario 1, this is due to using the worst case turning moments. These occur with the bow lying about 130-140 degrees off the wind. In the simulations, the vessels start at about 100 degrees off the wind. The hydrodynamic hull forces due to the downwind drift are tending to turn the vessels more broadside than their worst-case positions. The analysis shows that the turning moment is very sensitive to the precise drift angle. Because the actual vessel will be unknown and because both the analysis and the simulation depend on a few representative parameters it was felt that the precise drift angle was unknown and therefore the worst-case turning moments were used for the tug requirements.

Similarly, with scenario 2, the tug forces from simulation are even smaller than the analytic calculation. Starting the vessel moving allows its own hydrodynamic forces to generate a turning moment and is a good strategy for a smaller tug. The downwind drift allowed by the smaller tugs in the simulations while gaining control of the vessels ranged from 700 to 1100 meters.

The tug force required for turning either of the representative vessels in 40 knots of wind and sea state 6 is approximately 62 MT. The tug force required for towing either of the representative vessels against 40 knots of wind and sea state 6 at 1 knot is about 40 MT. A tug with a rated bollard pull of 81MT will be able to handle either of the representative vessels in these conditions.

An update to the study was conducted in 2014 to using updated vessel traffic data and environmental conditions data for the Aleutian Islands Geographic Zone. There were two notable differences from the original study:

1. The container ship is larger than in the previous study. Since the wind, forces tend to dominate the calculations and since the container ship has a very large windage area, the tug rating for the design conditions went from 81 MT to 108 MT.
2. The wave heights are larger in the Aleutians than the average conditions used in the original study. The increased wave heights affect both vessels but tend to be more noticeable for the tanker. The design condition for the tanker has almost doubled the tug rating from 24 MT to 41 MT.

### **Conclusion**

The tug force required for turning either of the representative vessels in 41 knots of wind and 33 foot seas is approximately 80 MT. The tug force required for towing either of the representative vessels against 41 knots of wind and 33 foot seas at 1 knot is about 52 MT. A tug with a rated bollard pull of 109 MT will be able to produce these forces for either of the representative vessels in these conditions.

### **Oil Spill Response and Salvage**

This section puts forth a quantitative analysis concerning various response and salvage operations under a wide range of environmental conditions. Safety is always the highest priority in any response and to the maximum extent possible, safety is the factor in response limitations.

The following table summarizes the Response Gap Index (RGI) for each tactic (averaged across all applicable locations), including both, the percentage of time that the RGI is impossible and the corresponding amount of time when a response may be possible.

| <b>Combined, Average RGI for Each Tactic and Percentage of Time Response May Be Possible</b> |                                                 |                                 |
|----------------------------------------------------------------------------------------------|-------------------------------------------------|---------------------------------|
| <b>Response Tactic</b>                                                                       | <b>RGI Year Round<br/>(Response Impossible)</b> | <b>Response May Be Possible</b> |
| Emergency towing                                                                             | 2%                                              | 98%                             |
| Helicopter Lightering                                                                        | 20%                                             | 80%                             |
| Open-Water Mechanical Recovery                                                               | 72%                                             | 28%                             |
| Near-shore Mechanical Recovery—Unalaska Bay (Daytime Only)                                   | 52%                                             | 48%                             |
| Aerial Application of Dispersants                                                            | 72%                                             | 28%                             |
| Vessel Application of Dispersants                                                            | 64%                                             | 36%                             |
| Air Observations—Fixed Wing (Daytime only)                                                   | 18%                                             | 82%                             |

#### **Overall Observations**

Overall, darkness and sea state appear to have the greatest effect on the ability to deploy the response operations.

While this analysis conveys overall that response in the Aleutian Islands region is likely to be precluded or significantly compromised by environmental conditions, the good news is the pollution prevention activities of emergency towing and lightering via helicopter are the most likely activities to be able to be implemented. The RGI for these operations is much lower than spill response activities, though mounting such operations requires that the necessary tow vessels, aircraft, and equipment be available (including adequate storage).

The RGI for aerial observations is also lower than for the response tactics. This at least means that in the event of an incident or accident, responders will be likely to be able to get the information they need in order to plan for response activities when they can ensue, or understand and anticipate the spill trajectory and therefore the resources that may be affected.

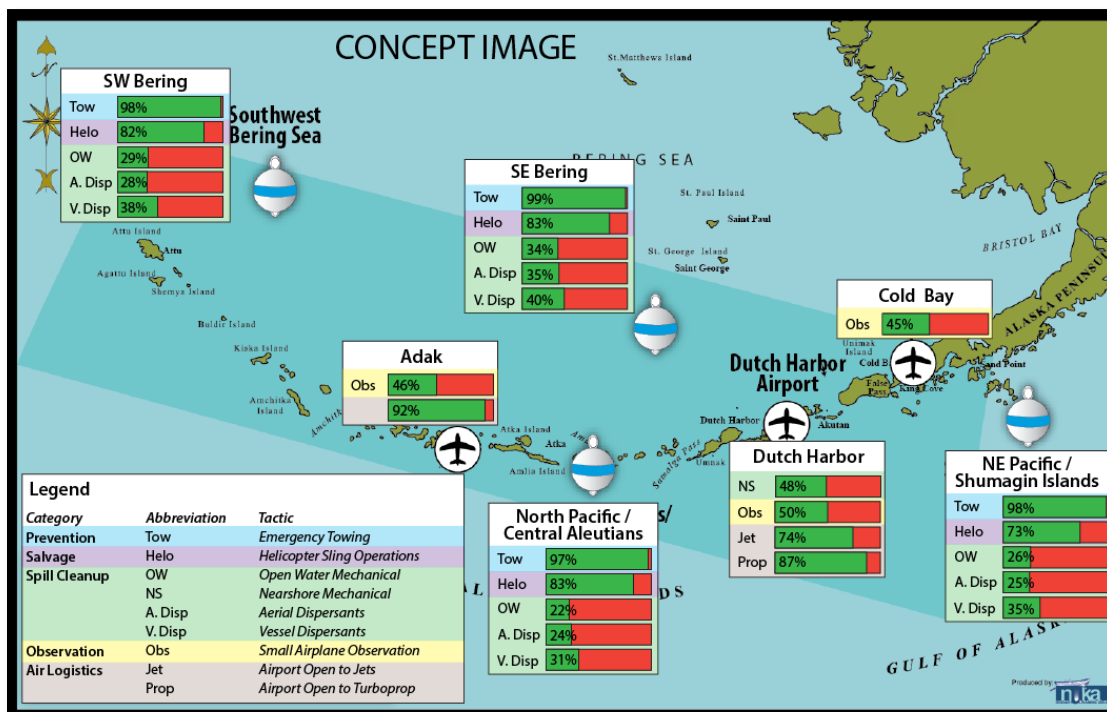

The average RGI are similar for spill response operations, which can be expected to be very challenging if they can be implemented at all. All three open-water tactics have large seasonal variations in feasibility, with RGI's rising to 84% to 90% in the winter, meaning that any of these response operations would be, at best, possible less than 20% of the time. Of these, the application of vessel dispersant has the lowest RGI to a small degree.

For near-shore mechanical recovery, marine forecasts were used to represent sea state, which makes this number conservative when compared to the other RGI. At least some of the Aleutian Islands have embayments that offer protection from the sea and these locations always have sensitive habitat and are

used as a refuge for many sensitive species. Experience during the Selendang Ayu response proved that near-shore response, shoreline protection, and shoreline cleanup tactics could be successfully implemented, even through the winter months.

Figure 9-1 shows the results for different types of operations based on different locations within the Aleutian Islands Geographic Zone. This figure also includes an indication of how often key airports are closed to jet and propeller planes based on weather. This provides one indication of the potential challenge to delivering equipment from other regions or moving it around within the region by air.

**Figure 9-1: Various Operations across the Aleutians Geographic Zone**

### Special Procedures

On June 1, 1998, in the wake of the November 1997 grounding of the Kuroshima at Summer Bay, the United States USCG Captain of the Port for Western Alaska issued Severe Weather Guidelines for the Aleutian Islands enumerating operating rules for offloading and onloading procedures for vessels at anchor. These guidelines are triggered at the "gale force" level of wind strength.

In February of 1999, the freighter Hekifu, which was in the process of attempting to comply with the Severe Weather Guidelines and move away from a vulnerable anchorage, encountered a severe and unpredicted increase in wind force. Subsequently, the anchor broke free of the bottom and the ship grounded on Rocky Point, Iliuliuk Bay.

March and April of 1999 brought a series of hurricane force storms accompanied by unprecedented snowfall and low barometric pressures. In the week between March 17 and March 25, three such storms hit Unalaska Island.

The Hekifu grounding made it apparent that more guidelines were needed to proactively address Port safety, analyze the approaching weather systems and decide on an appropriate course of action before severe weather arrives. These guidelines are divided into four general practices: the severe weather plan, winter ground tackle standards, seasonal anchorage restrictions, and general anchoring guidelines.

### **Marine Casualty Prevention**

Port of Dutch Harbor Severe Storm Plan, Winter Rules and General Anchoring Guidelines.

### **Severe Weather Plan**

Upon notification of a storm warning by NWS, the USCG Marine Safety Detachment Unalaska (MSD Unalaska) will contact the Alaska Marine Pilots (AMP), and vessel agents or masters to apprise them of the approaching weather system. The storm system will be tracked by all means possible including satellite photographs available via the National Weather Service Alaska Region internet website <http://paafc.arh.noaa.gov/marfcst.php>. When MSD Unalaska, AMP, and vessel agents or masters agree that a severe storm is imminent, the Port of Dutch Harbor office will be notified by fax, and the following steps will be taken:

1. Taking into account the predicted storm strength and wind direction, an analysis will be done by MSD Unalaska and AMP assessing the number of large vessels in the Port, their location, and their vulnerability to the approaching weather.
2. Upon agreement that certain vessels are at risk from the approaching weather, or from sea states generated by the approaching weather, MSD Unalaska will issue a notice to the agent or master of the at-risk vessels. Any at risk vessel will be directed by MSD Unalaska to prepare for severe weather, weigh anchor and move to sea, or to move to a less vulnerable anchorage. Notices will be faxed to the vessel agent, followed by a phone call to confirm receipt. Agents will relay the notice to the at-risk vessel's master immediately. If the vessel agent cannot reach the vessel master, MSD Unalaska will be immediately apprised that notification to that vessel has not taken place. If a vessel agent cannot be reached, the notice will be relayed directly to the vessel master. The Port of Dutch Harbor will be made aware of the notices by fax.
3. Upon notification to an at-risk vessel, AMP and the vessel agent or master will coordinate implementation of the notices issued by MSD Unalaska. When multiple vessel departures are necessary, AMP will decide the order of departures, with the most at-risk vessel first. A moored vessel will not normally be required to move unless the severity of the weather clearly poses an imminent danger if the vessel were to remain at the dock.
4. In the event of unpredicted and sudden weather, MSD Unalaska, AMP, and the vessel agent or master will agree on whether the vessel will be instructed to weigh anchor and put to sea, or be moved to another anchorage. The vessel(s) will make ready to depart before the wind increases to a point that would endanger the vessel, pilot vessel, or the pilot trying to embark or disembark the vessel. The Port of Dutch Harbor will be notified of the agreements by fax.
5. If the Port Director is not in Unalaska, or is otherwise unavailable, the Acting Port Director will make all decisions as pertains to this plan. The supervising officer, MSD Unalaska under the authority of the Captain of the Port, Western Alaska will issue Captain of the Port orders to enforce these provisions as necessary.

## **Winter Ground Tackle Standards for Vessels Anchoring In the Port of Dutch Harbor**

**Preface:** The bathymetry of the Port limits the number of useable anchorages for single screw, non-bow thrusted, non-controllable pitch propeller (CPP) vessels of 85 meters and above. The problem of large vessels anchored in the Port and dragging anchor in severe weather is due to the depth of anchorage, bottom characteristics, the vessel's loaded condition, and insufficient length of useable anchor chain aboard. Vessels with insufficient anchor chain for their anchorage will, depending on wind direction, drag ashore or drag off the assigned anchorage usually into a greater depth of water, further reducing the scope of the anchor chain, suddenly and dramatically decreasing the anchors holding capability.

Given the magnitude of winter weather conditions in and around the Port of Dutch Harbor, vessels without certain equipment are at greater risk in severe weather. Bow thrusters capable of bi-directional thrust control greatly increases the ship's ability to hold position. Controllable pitch propellers (CPP) add a great deal of control by using a vessel's engines to help hold position in severe weather. Placing a second anchor will greatly reduce shear force against the vessel as wind forces the ship to yaw back and forth. The minimum vessel size reflects that larger vessels have greater wind sail area and are more subject to control problems in high winds.

The following ground tackle standards for the Port are strongly suggested. These standards are intended to ensure single screw, non-bow thrusted, non-CPP vessels meet or exceed the minimums to anchor in the area between the months of October 1st through April 30th.

1. A single screw, 85 meters and larger vessel(s) without a bow thruster, or controllable pitch propeller (CPP), will maintain 10 useable shackles/shots (275 meters) of chain to the water's edge for both port and starboard anchors
2. A single screw, 85 meters and larger vessel(s) without a bow thruster, or controllable pitch propeller (CPP) that is anchored in the Port that has less than the recommended lengths of anchor chain will make arrangements with a tug of sufficient horsepower and size to control the vessel at all times in all weather conditions for any weather prediction of 45 knots or greater by the NWS while that vessel is at anchor in the Port. A written request for a waiver may be submitted and agreed upon if AMP, the Port and MSD Unalaska agree that the vessel is unlikely to drag anchor in its present location, taking into account the quality and size of the vessel's ground tackle, known vessel characteristics, location of anchorage, water depth and holding characteristics of the bottom.
3. Vessels anchoring are to take great care in fixing the vessel's position by all means available. In selecting an anchor position, a vessel's loaded condition, depth of water, type of bottom, and the amount of shackle/shots in the water shall be considered. This information must be recorded in the ship's logbook. An accurate swing and drag circle will be plotted on the vessels navigational chart. Those vessels equipped with a radar system capable of plotting this information should maintain a prudent and diligent plot at all times during severe weather conditions.

**Seasonal Restrictions of Anchorages:** Because of restricted maneuvering room and close lee shores in certain wind conditions, the South Iliuliuk anchorage described as south of a line from Rocky Point buoy east to the opposite shore on a bearing of 118 degrees true, and the Dutch Harbor anchorages, described as west of a line from Rocky Point buoy north to Dutch Harbor Spit Head light, will be utilized for anchorages between October 1st and April 30th by permission only. Permission **MUST** be obtained from MSD and the Port before anchoring any vessel in these restricted areas. Length of stay, reason for

requesting anchorage in a restricted area, and present weather conditions and forecasts will be considered in granting permission to anchor in the restricted areas.

#### **General Anchoring Guidelines:**

1. If a vessel at anchor intends to conduct any maintenance of their main propulsion systems that will affect in any way the vessel's ability to maneuver, the vessel agent or master MUST notify MSD Unalaska and the Port of Dutch Harbor and hire a standby tug "of suitable size and horsepower that can control the vessel in all weather conditions". Vessels that have become disabled through mechanical failure MUST notify MSD Unalaska and the Port of Dutch Harbor, and provide a detailed synopsis of the failure and an estimated time to affect repairs. A standby tug "of suitable size and horsepower that can control the vessel in all weather conditions" will be required for these vessels as well.
2. When a vessel has another vessel alongside while at anchor, and is planning to disable their Main Propulsion Systems for maintenance purposes, all of the vessels involved MUST notify MSD Unalaska and the Port of Dutch Harbor prior to conducting any maintenance. The vessel with full maneuverability will assume full responsibility for the disabled vessel while alongside.

**Summary:** By documenting and enforcing prudent marine practices suitable for the geography and often-severe climate of the Port, marine casualties such as the Kuroshima and Hekifu can be avoided. These measures are not meant to cause unnecessary delays, or costs to ship owners and their agents. The intent of this plan is to ensure that vessels have the necessary equipment and knowledge suitable to anchor in the area, and to mitigate any potential hazardous weather conditions before the conditions deteriorate to the point that moving the vessel is no longer possible or the pilot is endangered trying to board. Ships will often delay departure, or will not call for a pilot until weather conditions force them to stop their current loading operations. By that time, attempting a departure has placed the vessel in extremis and will place the pilot in danger if he/she is needed to guide the vessel to safety. The Port of Dutch Harbor Severe Storm Plan is intended to safeguard the Port, City of Unalaska, vessel crews, and the environment from marine casualty and the potential pollution resulting from vessel groundings.

#### **Recommended Routing Measures**

Designating areas to be avoided near sensitive or hazardous shoreline and preferred passes for use in international transit assist to prevent a vessel that loses propulsion or steering from drifting onto shore before a rescue can take place. Vessel monitoring by Automated Identification System (AIS) will facilitate the prompt detection of a vessel deviating from these routes or seeming to drift or otherwise be in danger.

On December 4, 2014, the USCG submitted a proposal to the International Maritime Organization Sub-Committee on Navigation, Communication and Search and Rescue. The proposal aims to establish five recommendatory areas to be avoided (ATBAs) in the region of the Alaska Aleutian Islands for vessels making transoceanic voyages through the Bering Sea and North Pacific Ocean adjacent to the islands. In most areas, the proposed ATBAs extend no further than 50 nautical miles from the shoreline of the islands, with a few areas of greater distance. The 50 nautical mile buffer allows time for repair or time to launch an emergency response effort to a foundering vessel before it runs aground and damages sensitive resources. It will also reduce the possibility of ships grounding on the shoreline due to negligent navigation. Course alternations due to the establishment of the ATBAs will be minimal. The proposed ATBAs will allow ships to follow existing traffic patterns. The establishment of an ATBA will add approximately ten (10) nautical miles to an average overall transoceanic voyage.

**Figure 9-2: Proposed ATBAs**

## **9730.2 – Bristol Bay**

### **9730.2.1 – General Description**

**Physical Features:** Portions of this region are in the maritime, transitional, and continental climatic zones. The weather in the region is the result of the interaction between land topography and major weather systems that move northward across the Gulf of Alaska or eastward across the Bering Sea.

The South side of the Alaska Peninsula is characterized by a fjord-like coastline rising to volcanic mountainous areas occasionally up to 8,000 feet. The north side of the peninsula and the Bristol Bay area are characterized by a relatively regular coastline with numerous sand and gravel beaches and abutting coastal lowlands, often drained by river systems terminating in broad estuarine areas. Major storm systems move northward off the Gulf of Alaska and into the South coastal highland areas, dropping precipitation usually as rain on the southern side and leaving the leeward (northern) side in somewhat of a rain shadow. The north side of the peninsula and Bristol Bay, however, are subject to eastward-moving storm systems from the Bering Sea; hence, these areas are among the stormiest in the State. Headwater

areas of the major Bristol Bay-Togiak drainages receive less precipitation than coastal areas and are subject to greater temperature fluctuations due to the influence of the continental climatic zone. The Bay spans 200 miles from its base at Port Moller on the Alaska Peninsula to its northwest boundary at Cape Newenham, and stretches northeasterly nearly the same distance to the mouths of the Nushagak and Kvichak rivers, which drain its inland reaches. The Nushagak and Kvichak are two of several major rivers in the region. At the west end are the Kvichak River (which drains Lake Iliamna), the Nushagak, the Alagnak and the Naknek River, which drains Naknek Lake on the Alaska Peninsula.

**Socio-Economic:** Bristol Bay is the world's largest sockeye salmon fishery and the state's largest salmon fishery, which is by far the dominant enterprise in the region. Dillingham and Naknek are the major fish processing areas as well as the main ports, although fishing fleets work out of numerous smaller communities also. Noncommercial harvest, including subsistence, is another major activity especially important in areas with no direct connection to the commercial fishing and processing industry.

Additional economic bases are provided by the tourist industry, mostly associated with sport fishing and hunting lodges in the Bristol Bay lakes area, and by government services including military bases. Infrastructural development is minimal. Dillingham is the only improved harbor in the Bristol Bay area, and the road network is minor and local. Most travel within the region is by plane (scheduled and charter) or private boat. There is no connecting road network and the Alaska Marine Highway System provides service just to Chignik. The population centers of the region are thus physically isolated from one another. This factor has limited the diversification of the local economies so that they remain closely tied to the regional fish and wildlife resources. Reference the community for specifics regarding socio-economic activities within each community.

**Oil Activities:** Deliveries of noncrude oils are made to the villages in this area primarily by barges operating from Dutch Harbor or the Cook Inlet Region. Deliveries are ice dependent and do not occur as ice forms. Delivery of non-crude oil is made to the remote villages in this area primarily by small barges.

**General:** There are 30 communities in the region (including the two boroughs), 27 Native and 3 non-Native.

#### 9730.2.2 – Local Contacts

This list of local contacts is not exhaustive, and the LOSC may notify additional parties. Phone numbers are not listed in order of importance and contacts will be made at the discretion of the LOSC/SOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., sitreps or other information) by fax or e-mail whenever possible.

### 9730.3 – Cook Inlet

#### 9730.3.1 – General Description

The geographic zone encompasses a very diverse array of topographical features, including extremely mountainous terrain, ice fields, tidewater and piedmont glaciers, river deltas and broad tidal mudflats, rocky shoreline, and boreal forests.

#### 9730.3.2 – Local Contacts

This list of local contacts is not exhaustive, and the LOSC may notify additional parties as well as those listed below. Phone numbers are not listed in order of importance and contacts should be made at the discretion of the LOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g. Sitrep or other information) by fax or e-mail whenever possible.

**Cultural Resources:**

The following organizations may provide information on local cultural resources and archaeological sites.

Alutiiq Museum

Phone: 486-7004

Fax: 486-7048

215 Mission Rd., Kodiak 99615

Baranov Museum

Phone: 486-5920

101 Marine Way, Kodiak 99615

**Environmental:**

Kodiak Audubon Society: 486-2685

Kodiak Community Conservation Network: 486-4684

Alaska Marine Conservation Council: 486-4684 and 486-3673

*9730.3.3 – Logistics*

For a response by CISPRI to a member company's spill, expect to use the CISPRI command center facility in Nikiski as a central location. Spills extending over a large area may require the establishment of auxiliary locations. Incident Commanders may consider the Denaina or Egan convention centers or one of the large hotels in Anchorage with expandable meeting/banquet rooms that offer the space and utilities required for a command post. The State Emergency Coordination Center at JBER (Camp Denali) or the Municipality of Anchorage Emergency Operations Center could also be activated for a major response operation.

Portable restrooms should be readily available in the Cook Inlet Geographic zone from Anchorage, Kenai, Soldotna, Seward, and Homer. Vendors include:

- Moore and Moore Services/Quick Sanitation, 235-8837 Service from Ninilchik to Homer.
- Peninsula Pumping, 907-262-5969, <http://www.peninsulapumping.com/> Service Locations: Sterling Hwy from the Seward Highway to Kasilof and the Kenai Spur Highway; including Cooper Landing, Kasilof, Kenai, Nikiski, Soldotna, and Sterling.
- Rent a Can, Service Locations: Seward Highway between Seward and Anchorage, North along the Parks Highway to Talkeetna, and east to Sutton along the Glenn Highway. Locations that are more distant may be arranged.

*9730.3.4 – Marine Fire Fighting Supplemental*

It is the goal of local fire departments, port facilities and the Coast Guard to develop and maintain a comprehensive system, which ensures fast, well-coordinated, and effective land-based response to vessel fires in Cook Inlet. Organizational policy and assumed responsibilities for both the Coast Guard and local response agencies and organizations have been described. These *general* policies, responsibilities and capabilities are important for planning. It is essential, however, that each organization agrees in advance to a minimal level of coordination and mutual aid. *Therefore, in the event of a marine fire the Coast Guard Captain of the Port, the local fire department covering the area in which the marine fire occurs, and the effected industrial port facility agree to:*

- Within one hour after initial notification, establish initial contact and consultation with each other, and begin to establish, direct, and manage a Unified Command System;
- Within four hours, establish an incident command post for Unified Command that includes as a minimum the Federal Incident Commander (COTP or representative), Local Incident Commander (Local Fire Chief or representative) and the Responsible Party Incident Commander if available;
- Use VHF radios to communicate inter-organizationally
- Ensure that all marine firefighting resource providers are integrated into Unified Command;
- Coordinate and request all additional resources through Unified Command, including requests for military (Navy SupSalv, etc.) and federal equipment.

The Coast Guard COTP will ensure Unified Command functions efficiently. When response agencies and the responsible party are unable to agree and implement response actions, the COTP will direct the response.

The COTP will also ensure that potentially affected natural resource trustees are consulted when the incident results in a pollution threat or may otherwise affect resources under their respective management authority.

#### **9730.4 – Kodiak**

##### *9730.4.1 – General Description*

**Physical Setting:** At 3,588 square miles, Kodiak Island is the largest island in Alaska and is the second largest island in the United States. Kodiak Island consists primarily of mountainous terrain with mountain ridges generally trending northeast southwest. Although several peaks are greater than 4,000 feet in elevation, most range between 3,000 and 4,000 feet. About 40 small cirque glaciers (none greater than 2 miles) are evident along the main divide. Numerous hanging valleys feed into the main canyons radiating from the central divide. Relatively short, swift, clear mountain streams drain the uplands.

Kodiak Island Borough lands along the west side of Shelikof Strait extend inland to approximately the Gulf of Alaska drainage-divide within the Aleutian Range of the Alaska Peninsula. Similar to Kodiak Island, the mountain range is oriented northeast-southwest. Mountain elevations within this area are generally less than 5,000 feet and the stream and river drainages are generally short and steep. Higher elevations of the Aleutian Range along the west boundary of the geographic zone include glaciers and perennially snow-capped peaks of active and inactive volcanoes.

**Climate:** The Kodiak Geographic zone experiences a characteristic maritime climate. The North Pacific high-pressure system dominates the area during the summer, bringing south to southwest winds and typical average air temperatures ranging from 50-54 degrees Fahrenheit. In winter, the weather is controlled by the Aleutian low atmospheric pressure system. Winds associated with this system are generally north to northwesterly, resulting in low temperatures at or below freezing. Summer winds tend to be slightly higher than in winter and are more consistent in direction. Shelikof Strait is bounded by mountains on the north and south and can be subjected to high winds related to the funneling of air between these mountain ranges.

Kodiak is warmed by the Japanese Current, which prevents the extreme seasonal temperature variations encountered in mainland Alaska. Kodiak's climate is similar to that of Southeast Alaska, but with less precipitation. January temperatures in the Kodiak Geographic zone range from 14 to 46 degrees Fahrenheit. July temperatures vary from 39 to 76 degrees. Average annual precipitation is 54.5 inches, with considerable ranges in precipitation amounts throughout the Geographic zone.

**Geology:** Exposed bedrock and shallow soils prevail along the rugged coastline of the Kodiak Geographic zone. Northwest Kodiak shows effects of glaciation, with long, narrow fjords and U-shaped valleys. These lie perpendicular to the mountains and the geologic fault lines. Typically, rivers enter at the heads of the fjords and are characterized by shorter, wider estuarine embayments. Southwest Kodiak Island and the Trinity Islands tend toward long, continuous shorelines with a few crenulate bays. Most of the sandy beaches occur on the western coast of Kodiak Island and the Trinity Islands.

Shelikof Strait is a trough formed by plate subduction tectonics. The Strait is a southwest continuation of Cook Inlet extending approximately 170 miles to a juncture with the waters of the North Pacific Ocean. The mountains and lowlands surrounding Shelikof Strait exhibit a full range of characteristic glacial features, and the offshore geology of the Strait displays evidence of past glaciations. Ice scour and moraine deposits in Shelikof Strait attest to the fact that ice completely filled the Strait and spilled out onto the Continental Shelf during past glacial advances.

The seafloor in Shelikof Strait is broad and generally flat with closed basins. Along the south side of the Alaska Peninsula, Shelikof Strait has relatively steep slopes descending over 190 meters in the south; areas of deepest water in Shelikof Strait occur along the southeastern side adjacent to Kodiak Island where they reach to depths of 240 meters.

**Geography:** Land development in the Kodiak Geographic zone has been limited to some extent by the dramatic topography of the archipelago, where elevations rise steeply from sea level to peaks of 2,000 to 4,000 feet. Most developable parcels of land are located on the relatively flat land along major bays and inlets. These bays and inlets generally form the terminus of the major drainages on Kodiak Island, and these populated areas often coincide with important wildlife habitat areas.

Until recently, the ownership status of many areas within the Kodiak Geographic zone was described as "unclear." While the status of certain areas may still be indeterminate, the Kodiak Island Borough Coastal Management Program has documented a trend over the last decade toward increased private ownership of discrete parcels of land in the geographic zone. The general pattern of land ownership has been described as numerous small parcels of privately owned land surrounded by federal or state lands, which are managed for wildlife and retained in public ownership.

Major landowners in the Kodiak Geographic zone include the Kodiak Island Borough, the municipalities and villages in the geographic zone, state and federal agencies, and local and regional native corporations. Most of the borough land was originally obtained and selected under municipal entitlement from the State of Alaska; other parcels were obtained through trades with the State. Over 50 per cent of borough land is located on Shuyak Island and Raspberry Island. State lands fall under the jurisdiction of the ADNR, ADF&G, and occasionally other state agencies. Federal lands include Kodiak National Wildlife Refuge land, National Parks lands, and USCG property. Much of the surface and subsurface land in the Kodiak Geographic zone is owned by regional and village Native corporations established under the Alaska Native

Claims Settlement Act (ANCSA) of 1971. Some of these lands are located within the boundaries of the Kodiak National Wildlife Refuge.

The Kodiak Geographic zone includes the City of Kodiak, the USCG Base, the road system communities of Bells Flats, Pasagshak, Anton Larson Bay and Chiniak, the rural communities of Akhiok, Karluk, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions, and numerous remote facilities and settlements, including Ben Thomas Logging Camp (Kazakof/Danger Bay), Big Sandy Lake Logging Camp, Lazy Bay/Alitak Cannery, Munsey's Bear Camp and Lodge, Olga Bay Cannery, Port Bailey Cannery, Port O'Brien/Uganik Bay Cannery, Port Williams Lodge/Cannery (Shuyak Island), Uyak Bay Cannery, and Zacher Bay Lodge/Cannery (Uyak Bay).

**Coastal Resources:** The diverse habitats of the Kodiak Geographic zone support extensive fish and wildlife populations that are extremely important to the social, economic, and cultural welfare of local residents. Offshore areas support a highly productive marine ecosystem, rich with intertidal, benthic, and pelagic plant and animal life, which supports extensive populations of marine and anadromous finfish, shellfish, seabirds, and marine mammals. Rocky shorelines and cliffs provide nesting areas for seabirds and pupping/haul-out areas for seals and sea lions. An assortment of shorebirds and waterfowl utilize the resources of the Kodiak Geographic zone, either as permanent residents or for nesting, wintering, or staging/feeding sites along their migratory paths. The rivers, lakes and streams in the geographic zone provide aquatic habitats for resident and anadromous fish important to commercial fisheries, subsistence harvests, and recreational activities. These fish resources are also a critical food source for upland populations of the Kodiak brown bear. In addition to the brown bear, elk, Sitka black-tailed deer, mountain goats, and numerous smaller mammals also populate upland areas in the Kodiak Geographic zone. The south side of the Alaska Peninsula also provides habitat for moose.

These resident and migratory populations of fish and wildlife depend on the availability of appropriate habitat and environmental conditions in order to exist in the Kodiak Geographic zone. A healthy coastline and continued abundance of marine, intertidal, and upland food sources are vital to the survival of all inhabitants of the Kodiak Geographic zone, including human populations. The protection of marine and coastal resources from the devastating effects of oil pollution is of primary concern to local residents, and these concerns are reflected in the Sensitive Areas section of the KSCP. For additional information on fish and wildlife diversity and abundance in the Kodiak Geographic zone, Reference the Sensitive Areas portion of this document.

**History, Culture and Economy:** Kodiak Island has been inhabited since 8,000 BC by Sugpiaq Eskimos. In 1792, Russian fur trappers settled on the island. Sea otter pelts were the primary incentive for Russian exploration at that time, and the commercial harvest of sea otter fur eventually led to the near-extinction of the species. Kodiak was the first capital of Russian Alaska, and Russian colonization had a devastating effect on the local Native population. By the time, Alaska became a U.S. territory in 1867 (the same year in which the capitol was moved from Kodiak to Sitka), the Koniag region Eskimos had almost disappeared as a viable culture.

In 1882, a fish cannery opened at the Karluk spit, and this sparked the development of commercial fishing in the area. The City of Kodiak was incorporated in 1940, and the Kodiak Island Borough incorporated in 1963. During the Aleutian Campaign of World War II, the Navy and Army built bases on Kodiak Island; the Air Force has also been active in Kodiak in the past. Fort Abercrombie was constructed in 1939, and later became the first secret radar installation in Alaska. The USCG eventually assumed the U.S. Navy property

on Kodiak, and today the Kodiak USCG base includes approximately 2,000 military personnel and their families.

The 1960s brought growth in commercial fisheries and fish processing in the Kodiak Geographic zone until the 1964 earthquake and tsunami virtually leveled the downtown area, destroying the fishing fleet, processing plant, canneries and 158 homes. The infrastructure was rebuilt, and by 1968 Kodiak had become the largest fishing port in the U.S. in terms of dollar value of landings (since surpassed by Unalaska/Dutch Harbor). When the 1976 Magnuson Act extended U.S. fisheries jurisdiction to 200 miles offshore, Alaskan ground fisheries saw a significant reduction in foreign competition and the ground fish processing industry in Kodiak began to develop as well. Today, Kodiak culture is grounded in commercial and subsistence fishing activities. Kodiak is one of the nation's top ports in both seafood volume and value. Municipal, State and federal agencies are the second largest local employer, and summer tourism continues to expand throughout the Kodiak Geographic zone.

#### 9730.4.2 – Local Contacts

This list of local contacts is not exhaustive, and the LOSC may notify additional parties. Phone numbers are not listed in order of importance and contacts will be made at the discretion of the LOSC/SOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., sitreps or other information) by fax or e-mail whenever possible.

#### *9730.4.3 – Logistics*

For the Kodiak Geographic Zone, a command post would likely be established somewhere in the City of Kodiak, since this is the one location in the region that could meet the command post and staging area requirements of a large response operation. The Kodiak Island Borough School District Superintendent serves as the primary contact for coordinating the use of local schools in the Kodiak Island Borough. The KIB Assembly Chambers is currently the designated EOC for borough-wide emergency responses, with the Alaska Army National Guard Armory the designated backup facility, but a new dedicated-EOC will be housed in the new police station, which is under construction on Mill Bay Road

#### 9730.4.4 – Risk Assessment

Each of the communities and remote settlements in the Kodiak Geographic zone faces the risk of oil or hazardous materials pollution from local shore side facilities and/or vessel traffic. Considerable vessel traffic transits the waters of the Kodiak Geographic zone, ranging from small fishing and recreational vessels to large oil tankers and freight vessels. Both crude (though uncommon) and refined oil products are shipped through the waters adjacent to Kodiak Island. In addition, Liquefied Natural Gas and crude oil tank ship traffic in Cook Inlet and Prince William Sound pose a threat to Kodiak Island and its adjacent waters.

By comparison with some regions in the state, the threat of an inland spill on Kodiak is minimal. There are no refineries in the Kodiak Geographic zone, but the geographic zone does support a number of fish canneries and processing plants, which are a potential source for chemical spills (primarily ammonia). The largest inland facility on Kodiak is the USCG base, which has several fuel farms containing gasoline, diesel, aviation fuel, and bunker fuel oil.

In the remote villages, where refined products are stored in tank farms, the highest probability of spills occurs during fuel transfer of refined products to the tank farm from another source, such as the fuel barge, or from feeder lines from the tank farm onto users. Another threat for spills or chemical releases exists in the loading/unloading activities with vessels at port. This is not to say that these spills are common, but that precautions should be observed.

The various types of petroleum products respond quite differently when released into the environment. Spills of refined product that enter the water generally will disperse and experience significant evaporation and spreading, making recovery difficult (Reference above: *A. Fate of Spilled Oil*). Crude oil and Intermediate Fuel Oils (bunker fuel) will be affected by the same natural degradation factors but to a much lesser degree; these oil spills are “persistent” in nature and will require aggressive actions and innovative techniques to successfully mitigate harm.

Spills in this subarctic-maritime climatic zone require careful preplanning to overcome the effects imposed by the moist, cold-weather environment. Machinery and people face significant challenges when operating in acute cold. The severe stresses imposed by winter conditions, with extreme temperatures and the extended darkness, can seriously reduce individual efficiency over a given period.

Cold weather conditions can prove beneficial, at times: ice and snow can act effectively as natural barriers, impeding the spread of oil, and can be used effectively to create berms for spill containment. Techniques for organizing and responding to spills in arctic environments have been developed and applicable supporting information should be consulted during an event.

The summer months expose many more species, both in diversity and numbers, to the negative effects of an oil spill. Whereas in winter, most species have left the regions and the snow and ice conditions may buffer the soil from the impact of released oil, during the warmer months the land, flora and fauna are all quite vulnerable to an oil spill. Though summer daylight increases the available work hours to allow almost continuous operations, the extended light does not increase the number of hours response personnel can safely perform tasks.

FINDINGS FROM 1998 RISK ASSESSMENT OF KODIAK GEOGRAPHIC ZONE: In 1998, the Kodiak Geographic zone Committee formed a workgroup to conduct, with the assistance of a contractor, a qualitative risk assessment of oil and hazardous substance spill threats in the Kodiak Geographic zone, undertaken as part of the planning process. The Kodiak Geographic zone Committee Workgroup members relied on historical oil spill data recorded by the Alaska Department of Environmental Conservation, NOAA, and the USCG MSD Kodiak and, in combination with observations by the Geographic zone Committee and its workgroup members, identified potential sources and types of oil spills that may occur in the Kodiak Geographic zone. This risk assessment assisted the planning process in several respects. The level and types of spill risks observed in the remote villages of Kodiak were used to help determine the contents of the equipment packages that were later staged at these locations.

These categories of spill risk have been qualitatively analyzed for the purpose of this plan, and include the following possibilities:

- Crude oil tanker spills in adjacent waters
- Crude oil tanker spills originating in Prince William Sound or Cook Inlet
- Operational spills at fixed facilities
- Catastrophic spills due to equipment failures or tank ruptures at fixed facilities
- Operational spills from fishing vessels during refueling
- Fishing vessel-source spills due to vessel casualties
- Freight vessel non-persistent spills due to casualties or groundings
- Freight vessel bunker fuel spills due to casualties or groundings
- “orphan” spills which originate from underground storage tanks or other unidentified sources
- Operational spills from tank vessels during refueling at Kodiak facilities
- Tank vessel non-crude spills which result from casualties or groundings
- Fish processing vessels with hazardous substances (ammonia/chlorine)

Upon examining historical spill data, and analyzing near-miss events and other observations and data regarding the threat of oil spills workgroup members from the Kodiak Geographic zone Committee determined that the risk of oil spills in the Kodiak Geographic zone varies among the communities. Important variables such as season, prevailing weather, and time of day may aggravate the risk of certain types of spills.

## **1. Conclusions of the 1998 Risk Assessment**

The Kodiak Geographic zone Committee Workgroup made the following conclusions regarding the risk of oil and hazardous substance spills in the Kodiak Geographic zone in 1998. These findings are still considered relevant for consideration today, and as such, remain as part of this plan. These observations are reflected in varying degrees in the scenarios chosen for inclusion in this plan (Reference Scenarios Section), in the response priorities identified in previous sections, and in contents of the borough-owned spill response equipment packages, which have been staged for use as first response resources in the remote communities of the Kodiak Island Borough.

*(Respective order of findings does not necessarily reflect severity or priority of risk)*

- The most common type of oil spill in the Kodiak Geographic zone is a fishing vessel-source diesel spill, which occurs during refueling. Fishing vessel diesel spills are the most common type of oil spill in the Kodiak Geographic zone, according to the records of the USCG MSD Kodiak and the ADEC and a NOAA report documenting oil spills on Kodiak Island during an eleven-year period (1985-1995).

- Foreign-flag freight vessels, especially log ships, pose a formidable spill risk, especially early in transit when such vessels carry significant quantities of bunker crude oil on board. In the fall of 1996, a near miss occurred when the Korean flag log ship PAN DYNAMIC suffered a loss of propulsion in Danger Bay. The PAN DYNAMIC had onboard nearly 500,000 gallons of bunker crude oil, and had the vessel grounded or the hull ruptured, the resultant spill would have presented significant challenges to responders, including a possible language barrier, an unresponsive Responsible Party, no vessel contingency plan, and the remote location of the threatened shoreline areas. Freight vessels like the PAN DYNAMIC frequently transit the waters adjacent to Kodiak, particularly during the summer months. The recent grounding of the M/V KUROSHIMA (November, 1997 and the more recent M/V SELENDANG AYU in December, 2004)) on Unalaska Island, further illustrates the risk posed by foreign cargo vessels. The M/V KUROSHIMA grounded in a winter storm and spilled approximately 40,000 gallons of bunker fuel. This scenario could easily have occurred in Kodiak. (The M/V SELENDANG AYU grounded and broke apart after losing power during a severe storm, resulting in the loss of crewmembers and 30,000 gallons of bunker fuel, which fouled miles of shoreline.)
- In several of the remote communities on Kodiak, the municipal/village tank farms pose a considerable risk for both operational spills during refueling and catastrophic spills resulting from old or poorly maintained tanks and piping. Limited funding and resources in many smaller communities contribute to this problem.
- The USCG Integrated Support Command (ISC) Kodiak has the largest quantity of fuel stored at their upland facility in Women's Bay, and a tank failure at this facility presents the potential for a large volume spill. The fact that a large quantity of response equipment and personnel are collocated with the facility serves to mitigate the risks from a large-scale spill or release at ISC Kodiak.
- In Kodiak, as in many parts of rural Alaska, the term "worst case scenario" may be linked more closely to geographic location, type of fuel, and weather/seasonal conditions than to the actual quantity of oil involved. Most areas and communities in the Kodiak Geographic zone are not accessible by road system, and adverse weather conditions often-complicate air and sea travel in the region. For this reason, a spill which originates in or threatens remote areas, especially environmentally sensitive or subsistence use areas, will pose many logistical challenges during a response. Other factors, such as the type of product spilled, nationality of vessel master and crew, and attitude and resources of the Responsible Party, can seriously complicate a spill response.
- The large number of underground storage tanks on former defense sites poses a potential spill risk, especially when the location and/or contents of these tanks is unknown. The risk of leaks from underground storage tanks is chronic in the Kodiak Geographic zone, and while the quantity of oil or other hazardous materials stored in these tanks is generally limited, it is important to recognize that underground storage tanks on Formerly Used Defense Sites and other such locations do pose a spill risk.
- A crude oil tank ship operating in Prince William Sound, Cook Inlet, or other regions adjacent to Kodiak could potentially affect the Kodiak Geographic zone, even if the spill source is located considerably beyond the limits of the geographic zone. This lesson was learned during the T/V EXXON VALDEZ spill, which devastated many shoreline areas in the Kodiak Geographic zone. It is important that the Kodiak Geographic zone plan be linked through notification procedures, communications, and response

actions with geographic zone plans for adjacent regions. It is important that, when more than one local government is affected by a spill, the local governments work together within the command structure.

- The fish processing plants located in the City of Kodiak, as well as in several remote communities, pose a moderate threat of hazardous substance releases, due to the quantities of ammonia (and sometimes chlorine) involved in processing fish products.

#### *9730.4.5 – Hazmat Supplemental*

The Kodiak Geographic zone encompasses a Local Emergency Planning District and has an active Local Emergency Planning Committee (LEPC), as defined under State statute and the federal Emergency Planning and Community Right-to-Know Act of 1986 (EPCRA). In the event of a hazardous materials spill in the Kodiak Geographic zone, the local *Kodiak Area Emergency Operations Plan*, which contains hazardous materials planning, training and response information for Kodiak Island, shall supplement the information in this plan.

Most hazardous materials releases are short-lived, acute emergencies, which present an immediate danger or threat to human health. Because of the short duration of most hazardous materials spills and the concurrent public health risks, the local government is often the ultimate command authority (Incident Commander) during a hazmat response. Safety considerations will generally dictate the course of a hazmat response, with activities such as evacuation prioritized in relation to spill containment and cleanup.

The community's local on-scene coordinator (LOSC) is in command and control of the response to a hazardous substance spill or release until he or she determines that there is no longer an imminent threat to health and public safety. The LOSC can at any time request higher authority to assume command and control of an incident. Local emergency plans should be consulted for any specific directions or guidelines. The local fire department and/or the LEPC should have the most current records on local storage of hazardous materials that are in quantities that meet federal reporting requirements.

**Notification and Reporting:** In the event of a hazardous materials spill or release in a reportable quantity, the responsible party shall follow the notification procedures outlined. The facility responsible for the release shall notify the Kodiak Emergency Services Director, ADEC and the USCG National Response Center and report the following: location and time of the discharge; type, quantity and properties of hazardous materials involved; weather conditions; and all other relevant information.

**Health and Safety:** First responders should be especially cautious, and should take appropriate safety precautions until a site safety plan has been implemented. The Incident Commander, based on the advice and recommendations of other on-scene coordinators and facility personnel, should make the determination whether evacuation is warranted. Public evacuation or implementation of the public warning system shall occur following the procedures outlined in the Kodiak Emergency Operations Plan.

**Incident Command:** The response shall follow the Incident Command System. As long as there is a threat to public health and safety, the Kodiak Emergency Services Director shall serve as Incident Commander.

**Response Capabilities in Kodiak:** Local priorities during a hazardous materials incident will be to secure the spill site and evacuate adjacent populations as necessary or shelter in place. The City of Kodiak's fire department has a Level A Hazmat Team that will generally be the primary responder to any hazmat event.

In addition to municipal resources, the environmental contractor at the USCG Base in Kodiak is equipped with Level C protection and appropriately trained personnel who may be contacted through the ISC Kodiak to respond to a local hazmat spill.

Statewide Level A Hazmat Response Teams are also available upon request by the SOSC, per signed agreements with ADEC. The formally agreed arrangements allow ADEC to request a Level A Hazmat team to respond to an event anywhere in the state, as long as the requested Hazmat Team can spare the services of the equipment and trained personnel. If additional response resources are needed in the Kodiak Geographic zone, the ADEC should be contacted in order for the SOSC to activate one of the other Alaska hazmat teams that have agreed to statewide response.

In addition, several of the larger industrial facilities within the geographic zone are required to have Risk Management Plans (RMPs) for chemicals exceeding threshold quantities under 40 CFR Part 68 regulations. The RMPs contain emergency response plans for mitigating facility releases. Large bulk fuel production and storage facilities within the geographic zone are required to maintain Facility Response Plans and specific levels of response equipment to mitigate oil releases in accordance 40 CFR Part 112.20 regulations.

#### *9730.4.6 – Marine Firefighting Supplemental*

For all vessel or marine facility emergencies in the Kodiak Geographic Zone in which the Incident Command System is implemented, the Local On-Scene Coordinator (LOSC) or Incident Commander (IC) will sit in the Unified Command with the FOSC, SOSC, and RPOSC, sharing decision-making and oversight responsibilities with the other On-Scene Coordinators. As long as there is an immediate threat to public safety, the LOSC will serve as the ultimate command authority for the public safety issue, while the FOSC, SOSC, and RPOSC will work with the LOSC to ensure mitigation of the situation. So long as the threat to public safety remains, the LOSC will be guided by the Kodiak Emergency Operations Plan developed by the Kodiak Regional Emergency Services Organization and the Kodiak Island Borough Local Emergency Planning Committee. If the FOSC, SOSC, or RPOSC does not assume the lead role for response efforts, the LOSC may request higher authority to assume that responsibility.

Additional policy guidance is provided to the LOSC by the Kodiak Regional Emergency Services Council, which is composed of the Emergency Services Director, the Mayor of the City of Kodiak, the Kodiak Island Borough Mayor and Manager, and the Commanding Officer of the USCG Integrated Support Command (ISC) Kodiak or their designees. Facility and vessel Oil Discharge Prevention and Contingency Plans and other emergency plans for operations in and around the Kodiak Geographic Zone should include a description of the LOSC position, which reflects the unique situation in the Kodiak Geographic Zone.

A major marine fire, particularly a vessel fire, may require resources beyond those locally available. Effective response will require coordination of resource deployment from a number of organizations.

The following categories of response resources were likely to be limited during a major marine fire in Kodiak:

- ❑ portable fire monitors,
- ❑ vessels with fire monitors,
- ❑ tugs,
- ❑ onboard fire suppression teams,
- ❑ firefighting foam,
- ❑ de-watering pumping equipment,

- ❑ landing craft and
- ❑ Marine firefighting consultants/advisors.

#### 1. Mutual Aid for Firefighting

All fire departments, including the USCG Integrated Support Command, have signed mutual aid agreements with the other area fire departments. Assistance for firefighting or emergency aid are made and rendered between the fire chiefs or their designees.

#### 2. USCG ISC Kodiak Fire Department

The USCG Integrated Support Command (ISC) Kodiak maintains a 32-person dedicated (full-time) fire department trained and equipped to conduct firefighting and aircraft casualty rescue for the USCG Air Station. The ISC Fire Department can deploy crash trucks and fire trucks that have more foam application capability than other Kodiak municipal fire departments. Many of the firefighters are former members of the USCG or US Navy and have had training in shipboard damage control and marine firefighting. The ISC Fire Department also conducts weekly drills with one of the three USCG cutters home ported in Kodiak.

The USCG ISC Fire Department can provide mutual aid assistance upon request of the City or Borough of Kodiak.

Marine Band Channel 12 serves as the working frequency for the City of Kodiak Harbormaster

#### *9730.4.7 – Marine Firefighting Scenarios*

The following scenarios describe possible actions of land-based responders from the City of Kodiak and the Kodiak Island Borough. These scenarios are provided to generate discussion and review of community capability. They should not be viewed as the “textbook” response for marine fires. However, the reviewers should examine their own response organizations capacity, authority and policies in light of the actions referenced in the following scenarios. Ask the following questions:

- ❑ Do I have enough available trained personnel to mount a similar response?
- ❑ Do I have the equipment?
- ❑ Do existing policies prohibit the types of response described below?
- ❑ Is mutual aid needed?
- ❑ Is communication between the various response organizations adequate to get the type of inter-agency coordination described here?

#### Scenario 1: Fishing vessel fire in St. Herman Bay marina (Offensive Tactics)

A 60-ft wooden fishing vessel was reported burning in the marina at 3:00 a.m. One pumper and eight firefighters responded. Upon arrival, the responders observed heavy black smoke coming from the wheelhouse. Concerned that the occupants may still be aboard, the first arriving fire company officer directed two firefighters to don turnout gear and SCBA and to search the vessel. The remaining crew, with assistance from the Harbormaster, established a water supply using hose lines from the pumper and harbor standpipe. Water was directed into the pilothouse through a partially open window. The searchers did not find any occupants. Two additional hose lines were charged and placed on standby to protect the surrounding vessels. To prevent firewater from sinking or capsizing the vessel, the chief directed four members of the fire party to secure the fish-hold hatch forward and the lazarette aft of the pilothouse. Once all openings and hatches were secured, firefighting water was increased and the fire

was extinguished within 20 minutes. Responders from the local USCG Marine Safety Detachment worked with the harbormaster to place containment boom around the vessel to capture contaminated debris and oily water runoff. The harbormaster used some of the city's 1000 feet of 12-inch harbor boom. The USCG obtained assistance and boom from a local marine fuel transfer facility. All containment boom was in place by 6:00 a.m. The occupants of the vessel arrived at 4:00 a.m. The owner of the vessel could not be located or immediately identified. At 8:00 a.m., the fire chief requested the USCG COTP to ensure the vessel was cleaned of oil and hazmat. During the next 5 days, a contractor hired by the USCG pumped the firewater off the vessel and removed three propane tanks and 200 gallons of fuel and lube oil. The cleanup was completed quickly and relatively inexpensively because the fire chief had taken action to ensure that the firefighting efforts did not sink the vessel. Three months later, when efforts to get the owner to take responsibility for the vessel were unsuccessful, the vessel was towed out of the marina by the harbormaster, beached and burned.

#### Scenario 2: Deck fire on fuel barge (Offensive Tactics)

A large wake broke the transfer couplings on a fuel barge offloading gasoline and kerosene at a transfer facility and tank farm on the city waterfront. The spilled products pooled and ignited on the barge tank top. Product draining from the transfer hose fed the fire. The city, because of the immediate threat to public safety, assumed command and control of the incident. Personnel from the USCG Marine Safety Detachment and the manager of the marine transfer facility assisted the fire chief (overall incident commander) in size-up. The fire chief ordered a tug to standby to tow the barge from the facility and away from the Kodiak downtown area. All four area fire departments (City of Kodiak, Women's Bay, Bayside, and USCG ISC) responded with equipment and personnel under their respective mutual aid agreements.

After consultation with the USCG, the transfer facility manager and other fire chiefs, the incident commander decided to make one attempt to extinguish the fire while the vessel was moored at the facility. Valves and cargo pumps were secured. The integrity of the barge tank tops, piping, mooring lines and other exposures were protected with water streams. A crash truck with 200 gallons of foam was ordered from the USCG ISC Fire Department. Within one hour of initial response, the incident commander determined there was enough foam on scene to extinguish the fuel fire burning on the barge tank top. Backed by water fog monitors, two teams successfully attacked the fire from upwind with the foam. Once the fire was extinguished, a foam blanket was maintained over the pooled fuel to prevent re-ignition. Incident Command decided not to deploy oil containment boom around the barge, preferring that the gasoline spread and dissipate. Response crews used the fire monitor on the M/V Wolstad to break up, dissipate petroleum residue and sheen, and keep flammable/combustible liquids from pooling under docks and wharves.

#### Scenario 3: Engine room fire on large cruise ship (Defensive Tactics and Support Services)

While underway 30 miles from Kodiak, the cruise ship Sugarland (600' LOA, 1200 passengers and crew) experienced an engine room fire that the crew was unable to extinguish. The master requested that the vessel be allowed to tie up in Kodiak. After extensive consultation with the USCG Away Team on board the C/S Sugarland, which received assurances that the engine room had been isolated with primary and secondary fire boundaries, the city manager, with backing from the mayor and fire chief, agreed to allow the cruise ship to tie up to the west end of Pier #2. (The west end of Pier #2 is steel and further from the

neighboring marine fuel transfer facility and tank farm.) Using its bow thrusters and one assist tug, the cruise ship was able to make fast to the pier. All 850 passengers and non-essential crew were removed from the vessel. Prior to passenger and crew evacuation, the Unified Command insisted on a strict accountability system using manifests and disembarkation check-off lists. The passengers and crew were temporarily sheltered in available hotels, restaurants, churches and community centers until they could be flown out of Kodiak. Using the international shore connection, the cruise ship fire mains were re-charged through the city water supply. Fire departments provided a continuous supply of charged air bottles for the ship's crew who concentrated on cooling and monitoring the fire boundaries around the isolated engine room. Fire department aerial trucks were used to cool the main deck above the engine room. Ship stability was constantly monitored and cooling water was pumped off and discharged overboard into the containment boom that now surrounded the vessel. The engine room was re-entered when thermal imaging equipment could no longer detect interior hot spots. The C/S Sugarland was towed from Kodiak nine days after the master originally requested permission to enter.

## **9730.5 – North Slope**

### *9730.5.1 – General Description*

The North Slope Geographic zone boundaries match those of the North Slope Borough, which is the largest borough in Alaska with over 15% of the state's total land area. The geographic zone encompasses the entire northern coast and most of the northeastern coast of Alaska along the Arctic Ocean and contains approximately 89,000 sq. miles of land and 5,900 sq. miles of water, making it larger than the State of Utah. The geographic zone's southern boundary runs in an east - west direction at 68° North latitude, about 105 miles north of the Arctic Circle, which is at latitude 66° 30' North. The geographic zone extends east to the border with Canada, west to the Chukchi Sea, and north to the Beaufort Sea. Point Barrow (71° 23' N, 156° 29' W), seven miles north of Barrow, is the northernmost point in the US.

Though the geographic zone lies entirely above the Arctic Circle, portions of the region are in the arctic, transitional, and continental climatic zones. The weather in the region is the result of the interaction between global air movements, land topography, and major weather systems that move north-south and east-west across the Bering Sea. The region's climate is mostly arctic: temperatures range from -56° to 79° Fahrenheit, with summer temperatures averaging 40°F and winter temperatures averaging -17° F, though high winds frequently yield much lower chill factors. The strongest wind recorded in Barrow was from the southwest in February 1989, at 74 mph. On the North Slope, February is the coldest month and July is the warmest. Winters also include periods of approximately 65 days without daylight, depending upon the latitude; correspondingly, summer offers the reverse, with as many days having no sunset. The region is classified as a wet desert, because the average annual precipitation is only about 5 to 7 inches, with snowfall averaging 20 inches. Most of the snow that falls on the tundra is actually snow that has been blown there from somewhere else.

Mountain ranges in the North Slope Geographic zone include the Brooks Range and the Davidson, Philip Smith, Endicott, and DeLong Mountains. The highest point on the North Slope is Mount Chamberlin (9,020 feet) in the eastern Brooks Range. Apart from the mountains, the region is characterized by rolling, treeless tundra. The larger river basins in the region include the Canning, Sagavanirktok, Colville, Ikpikpuk, Kuk, and Utukok. The Colville River is the longest river (about 428 miles long), and the largest lake, Teshekpuk Lake, southeast of Barrow, is 22 miles long and covers 315 square miles.

Permafrost underlies the entire region. On the Arctic Coastal plain, permafrost starts between 1 to 2 feet below the surface and has been found at depths of 2,000 feet. Permafrost and the surface layer on top of it are remarkably fragile and special construction techniques (e.g., ice roads, gravel pads, structures

built on pilings, reinforced concrete foundations with heat radiation devices, etc.) have been devised to protect them.

The Chukchi and Beaufort Seas of the Arctic Ocean are the primary marine waters associated with the geographic zone. The entire marine area of the region lies within the continental shelf. Sea ice formation in the Chukchi and Beaufort Seas begins in October, and the ice pack persists through late June, although the ice begins to melt and break up in April. The northern coast of Alaska has some of the highest rates of coastal erosion in the world. Coastal erosion in excess of 300 feet in a year has been documented. Coastal erosion in Prudhoe Bay averages 6 to 17 feet per year.

**Figure 9-3: Shoreline Erosion**

J.W. Dalton Drill Site Erosion. Located east of Barrow on the Beaufort Sea near Teshekpuk Lake and Point Lonely DEW line site. This photograph was taken in 2003 and you can see that between the summers of 2003 and 2004 over 300' of shoreline eroded away along part of the site. Approximately 600' of coastal plain were lost over a six-year period. Photo provided by BLM

The Arctic National Wildlife Refuge occupies the eastern half of the region. The portion of the Arctic National Wildlife Refuge within the NSB has an area of approximately 18,500 square miles. Beginning at the western border of the Refuge are the oil fields of Prudhoe Bay, which stretch west approximately 125 miles to the National Petroleum Reserve – Alaska (NPRA). Created by presidential executive order in 1923 and originally called the Naval Petroleum Reserve, the NPRA contains nearly 37,000 square miles. Approximately 3,900 square miles of the Gates of the Arctic National Park lay within the North Slope Geographic zone along the Brooks Range, and the Noatak National Preserve, directly to the west, contains nearly 3000 square miles. Along the coast at Point Hope lies the Chukchi Sea portion of the Alaska Maritime National Wildlife Refuge, which includes approximately 370 square miles.

The population of the borough consists of 74% Alaska Native or part Native. Inupiat Eskimos, the majority of permanent residents, have lived in the region for centuries, active in trading between Alaskan and Canadian bands. (The oldest inhabited site on the North Slope is the Mesa Site, about 200 miles South of

Barrow on the northern flank of the Brooks Range. It was first inhabited about 11,700 to 9,700 years ago.) Traditional marine mammal hunts and other subsistence practices are an active part of the present-day Inupiat culture.

During World War II, Atqasuk was a source of coal. Oil exploration in the 1960s led to the development of the huge reserves found in Prudhoe Bay and, subsequently, building of the Trans-Alaska Pipeline in the 1970s.

The Borough incorporated in 1972. There are eight North Slope villages (Anaktuvuk Pass, Atqasuk, Barrow, Nuiqsut, Kaktovik, Point Hope, Point Lay and Wainwright) and an unincorporated town serving the oil industry (Deadhorse). The total borough population recently dropped below 7000, with most permanent residents living in Barrow, the largest village (population near 4200) and the center of local government for the North Slope Borough. After the passage of the Alaska Native Claims Settlement Act (ANCSA) in 1971, families from Barrow re-settled the abandoned villages of Atqasuk and Nuiqsut. North Slope oil field operations provide employment to over 5,000 non-residents, who rotate in and out of oil work sites from Anchorage, other areas of the state, and the lower 48. Census figures are not indicative of this transient work site population.

Air travel provides the only year-round access, while land transportation provides seasonal access. There is no road system connecting the North Slope villages to each other. "Cat-trains" are sometimes used to transport freight overland from Barrow during the winter. Barges operating from Dutch Harbor or Cook Inlet deliver noncrude oils to the villages. Deliveries are ice dependent, and do not occur when too much remains from winter or when new ice forms.

The only road from "outside" is the James Dalton Highway (formerly called the Haul Road), which essentially parallels the Trans-Alaska Pipeline System (TAPS) starting at Livengood, north of Fairbanks, and ending at Deadhorse in the Prudhoe Bay area. Apart from cargo and passenger airplanes, travel on the North Slope is by boat in the summer and snow machine in the winter. In late summer, some supplies are barged from Anchorage or Seattle to the coastal villages and the industrial facilities at Prudhoe Bay. In winter, large vehicles with huge balloon-like tires or wide tracks are used for oil exploration activities. Routine industrial traffic uses ice roads, which are constructed through a process of pouring water over the frozen tundra or onto the surface of a lake; the water quickly freezes and is solid enough to drive on.

Human activities in the Arctic Region revolve around the subsistence, sport, and commercial uses of fish and wildlife. Oil and gas development and production on the arctic coastal plain has provided the primary source of wage employment and government funds. Infrastructure development is minimal by national standards, except within the developed oil fields.

The North Slope region encompasses a vast area that has relatively limited risks in some respects, but elevated risks when considering certain factors. The North Slope has a very small population covering thousands of square miles. The number of facilities storing, handling and transferring refined products is very small. These facilities typically provide fuel mainly for the generation of electricity and heating homes. The fuel is also used to power vehicles and vessels, which are relatively few in number as well. Tank barges provide fuel to these facilities no more than twice each year and only during the short open-water season. Numerous exploratory and production wells exist in the region and produce a large amount of crude oil which is piped above ground to processing facilities before being shipped through the Trans Alaska Pipeline to Valdez.

Numerous hazards are inherent in the transportation, storage, exploration development and production of petroleum products. The impact of these hazards can be lessened or avoided completely through proper operations. The shoreline geomorphology of this region does not present a hazard to the integrity of a vessel. Most of the shorelines fall into some type of sand/gravel/cobble combination, peat, tidal flats, or vegetated shores.

The operating season is very short in this region because of the late ice breakup and the early freeze-up of the Beaufort and Chukchi Seas. Vessels have been damaged by ice, which is an ever-present concern. The movement of ice, whether during freeze-up, breakup, or in the dead of winter can produce great stresses on vessels and structures, all of which could sustain damage in this harsh environment.

Tidal currents and sea states in the Beaufort and Chukchi are not usually extreme and will generally not pose a risk to operations. Strong storms and high winds are unusual during the period when vessels are transiting the region. However, storm surges can occur and would pose a substantial risk to shoreline cleanup operations and personnel.

As with all areas within Alaska, the North Slope region supports a wide range of wildlife. During the season when the North Slope is thawed, the inland and shoreline areas are a haven for migratory waterfowl and other birds. Local communities rely on marine mammals as a traditional food source, and these mammals are present in concentrated areas during certain times of the year. Polar bears roam the ice pack and are very susceptible to oiling, as are almost all of the other mammals, birds, and fish in the region. Residents of the North Slope primarily engage in a subsistence lifestyle and rely heavily on the availability of the resources in the area. Any spill of significance could devastate their food harvest and seriously threaten their normal means of existence. Any long-term impacts to their food resources could have a disastrous impact on their way of life. The Sensitive Areas Section provides detailed information on specific resources and their locations in the region.

#### 9730.5.2 – Local Contacts

This list of local contacts is not exhaustive, and the LOSC may notify additional parties. Phone numbers are not listed in order of importance and contacts will be made at the discretion of the LOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., sitreps or other information) by fax or e-mail whenever possible.

| Village Health Clinic.....                                                       | 763-2714           |                    |

#### 9730.5.3 – Logistics

Generally, support facilities and services will be limited in nearly all locations. The deployment of these limited resources will be further dependent upon the season. For instance, the short open water periods for the Beaufort and Chukchi Seas (roughly a three-month period between the average breakup and freeze-up dates) place an additional demand on tactics and planning for responding to an on-water oil spill in this region. The *Milepost* and *Alaska Wilderness Guide* contain valuable information and may be a resource to consult for more in-depth information.

[The Alaska Clean Seas Technical Manual](#), Volume 1 (*Tactics Descriptions*), provides a comprehensive listing, description, and specifications for spill response equipment assets available to the North Slope oil

industry. Additionally, the *Alaska Clean Seas Technical Manual, Volume 2 (Map Atlas)* provides information on North Slope air accessible airstrips, staging areas and pre-staged equipment, vessel access and hydrographic conditions (along with priority protection sites and general environmental sensitivities).

Fairbanks to Prudhoe Bay, by highway is 490 miles. The Dalton Hwy speed limit is 50 mph.

For transportation via air and water, the following table provides distance from Anchorage and Fairbanks to some of the North Slope communities. Times assume favorable weather and do not take into account delays waiting for favorable tides. Distances are from tables found in the back of *U.S. Coast Pilot, Volume 9 -Pacific and Arctic coasts of Alaska from Cape Spencer to the Beaufort Sea*. (Available on the internet at [chartmaker.ncd.noaa.gov/NSD/coastpilot.htm](http://chartmaker.ncd.noaa.gov/NSD/coastpilot.htm).)

#### 9730.5.4 – Risk Assessment

In the remote villages, where refined products are stored in tank farms, the highest probability of spills occurs during fuel transfer of refined products to the tank farm from another source, such as the fuel barge, or from feeder lines from the tank farm onto users. This is not to say that these spills are common.

The oil industry, especially active in the North Slope Geographic zone, includes onshore and offshore wellheads, crude oil production facilities, major crude oil and non-crude oil storage, and pipeline facilities. Most exploration and production work is concentrated in the Prudhoe Bay area, but other oil production activities extend westward to Oliktok Point. The Trans-Alaska Pipeline System originates at Prudhoe Bay, and two of the pump stations are located in the North Slope Geographic zone. Refined products are stored in tank farms at the oil production facilities. Pipeline leaks within the vast industrial complex pose one of the greatest risks for spills.

Another threat for spills, especially chemical releases, comes from trucking accidents on the long and remote Dalton Highway. Several large diesel fuel spills have resulted from vehicle accidents.

The various types of petroleum products respond quite differently when released into the environment. Spills of refined product that enter the water generally will disperse and experience significant evaporation, making recovery difficult. Crude oil will be affected by the same natural degradation factors but to a much lesser degree. Crude oil spills are “persistent” in nature and will require aggressive actions and innovative techniques to be successful in the harsh Arctic environment.

Spills that occur in the Beaufort Sea will tend to flow from east to west according to the currents and the predominant winds. Beaufort Sea spills will, therefore, typically not be driven ashore immediately, and impacts reaching the shoreline can be expected to be spread over a larger area rather than a higher level

of oiling along a smaller area. Spills in the Chukchi will typically be carried away from shore by prevailing winds and currents, though this does not mean that shoreline impacts should not be anticipated; spills rarely behave as expected. In all spill events, planning should address the possibility of the shoreline being affected by the release.

Spills in the Arctic require careful preplanning to overcome the effects imposed by the cold-weather environment. Machinery and people face significant challenges when operating in acute cold. The severe stresses imposed by operating in winter conditions with extreme temperatures and the extended darkness can seriously reduce individual efficiency over a given period. Recovery of oil in broken ice conditions is tremendously difficult and hazardous. Cold weather conditions can prove beneficial, at times: ice and snow can act effectively as natural barriers, impeding the spread of oil, and can be used effectively to create berms for spill containment. Techniques for organizing and responding to spills in arctic environments have been developed and these documents should be consulted during an event.

The summer months expose many more species, both in diversity and numbers, to the negative effects of an oil spill. Whereas in winter, most species have left the regions and the snow and ice conditions may buffer the soil from the impact of release oil, during the warmer months the land, flora and fauna are all quite vulnerable to an oil spill. Though, summer daylight increases the available work hours to allow almost continuous operations, the extended light does not increase the number of hours response personnel can safely perform tasks.

#### *9730.5.5 – Hazmat Supplemental*

The Prudhoe Bay oil industry also maintains Level A capable teams. In addition, several of the larger industrial facilities within the Geographic Zone are required to have Risk Management Plans (RMPs) for chemicals exceeding threshold quantities under 40 CFR Part 68 regulations. The RMPs contain emergency response plans for mitigating facility releases. Large bulk fuel production and storage facilities within the Geographic Zone also are required to maintain Facility Response Plans and specific levels of response equipment to mitigate oil releases in accordance 40 CFR Part 112.20 regulations.

The North Slope Borough has developed and maintains a local emergency response plan, or all-hazard plan, to respond to a variety of emergencies, including hazardous substance releases.

### **9730.6 – Northwest Arctic**

#### *9730.6.1 – General Description*

The geographic zone encompasses a very diverse array of topographical features in the subarctic and arctic, including mountainous terrain, rivers, river deltas, tidal mudflats, wetlands, sand and gravel beaches, rocky shorelines, boreal-arctic transition zones, boreal forests, and various types of tundra.

#### *9730.6.2 – Local Contacts*

It is the responsibility of the LOSC to initiate contact with the following local government agencies and organizations once emergency notifications have been made. This is not an exhaustive list of local contacts, and the LOSC may notify additional parties as well as those listed below. Phone numbers are not listed in order of importance, and contacts should be made at the discretion of the LOSC. Initial

notifications will be made by telephone, with concurrent transmission of any available documents (i.e. Sitrep or other information) by fax whenever possible.

#### *9730.6.3 – Risk Assessment*

Considerable vessel traffic transits the waters of the Northwest Arctic Geographic zone, ranging from tankers, fishing vessels, recreational vessels, government vessels, cruise ships, cargo vessels, tugs, and barges. Refined oil products and cargo are shipped into Northwest Arctic Geographic zone and mineral resources and seafood are shipped out. Figure E-7 shows simplified bulk fuel carrier and cruise ship routes in relationship to major communities, nearshore fishing grounds, airports, and response equipment depots.

The primary port for bulk cargo including refined petroleum products and mineral resources activity is at the Red Dog Mine Port Site.

According to the Bering Sea Vessel Traffic Risk Analysis, 13.4 million barrels of non-persistent oil and 10.7 million barrels of persistent oil (including oils of low, medium, and heavy persistence) were transported in Bering Sea waters between 2013 and 2015. (Nuka Research and Planning Group, LLC, Bering Sea Vessel Traffic Risk Analysis, December 2016).

Any vessel traffic throughout the Bering Sea has the potential impact to Alaskan waters and shorelines. For example, a vessel transiting through international waters can become disabled, and drift into U.S. and Alaskan waters, and become a potential for a release. This potential risk increases the importance of good vessel tracking, communications, preparedness, planning, and the development and maintenance of support and response systems in the region.

***Figure 9-4: Northwest Arctic, Alaska Risk Layers for Candidate Sites for Geographic Response Strategies and Potential Places of Refuge***

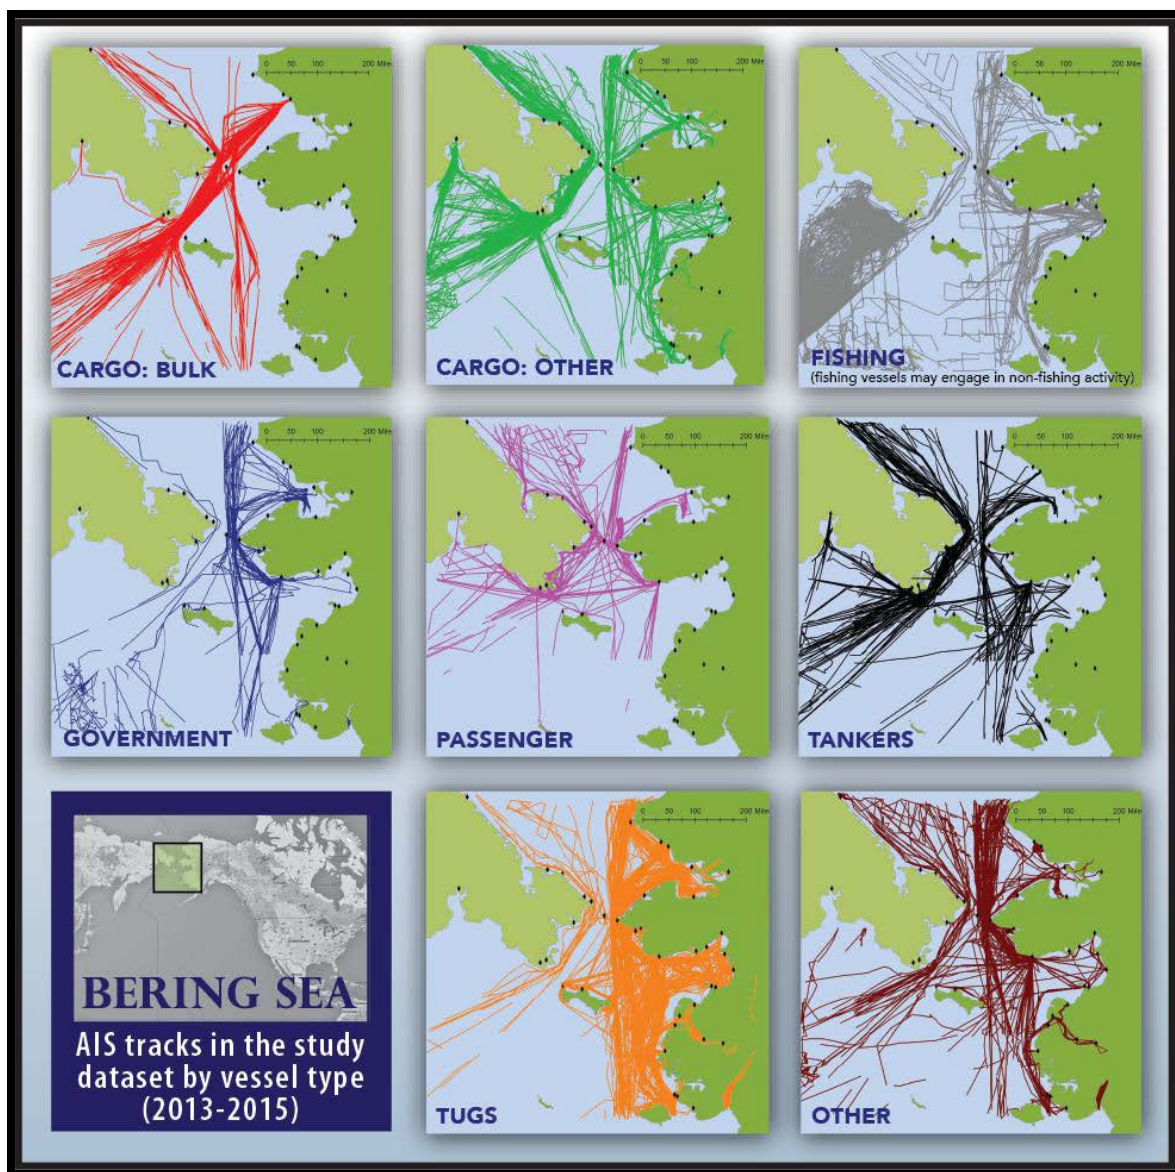

Cold weather conditions can prove beneficial, at times: ice and snow can act effectively as natural barriers, impeding the spread of oil, and can be used effectively to create berms for spill containment. Techniques for organizing and responding to spills in arctic environments have been developed and applicable supporting information should be consulted during an event.

The summer months expose many more species, both in diversity and numbers, to the negative effects of oil spills. Whereas in winter, most species have left the region and the snow and ice conditions may buffer the soil from the effect of released oil, during the warmer months the land, flora, and fauna are all quite vulnerable to an oil spill.

**Figure 9-6: Automatic Identification System (AIS) Tracks Recorded by Vessel Type in Bering Strait Region 2013-2015**

(Nuka Research and Planning Group, LLC, Bering Sea Vessel Traffic Risk Analysis, December 2016)

**Figure 9-7: Percentage of Overall Weighted Oil Exposure Attributed to Activities**

Note that the 46% of tankers calling at U.S. ports (or lightering) does not include those serving Red Dog mine. This chart also includes oil exposure data from the Russian side of the Bering Sea and the Western Geographic zone. (Nuka Research and Planning Group, LLC, Bering Sea Vessel Traffic Risk Analysis, December 2016)

**Figure 9-8: Non-persistent and Persistent Oil Moved via Vessels > 300 GT in Northwest Arctic in 2010**

Note that oil exposure of barges was not calculated for these charts, as AIS data describing operating days for barges was not adequate to develop a weighted oil exposure percentage.

#### *9730.4.4 – Hazmat Supplemental*

There are no Level A Hazmat response teams in the Northwest Arctic Geographic Zone. In the event of a hazardous substance release, ADEC should be contacted and they can take action to activate the Statewide Hazmat Response Team. This formally agreed arrangement allows ADEC to request a Level A Hazmat team to respond to an event anywhere in the state, as long as the requested Hazmat Team can spare the services of the equipment and trained personnel.

In addition, several of the larger industrial facilities within the Geographic Zone are required to have Risk Management Plans (RMPs) for chemicals exceeding threshold quantities under 40 CFR Part 68 regulations. The RMPs contain emergency response plans for mitigating facility releases. Large bulk fuel production and storage facilities within the Geographic Zone also are required to maintain Facility Response Plans and specific levels of response equipment to mitigate oil releases in accordance 40 CFR Part 112.20 regulations.

Several communities in the Northwest Arctic Geographic Zone have developed and maintain local emergency management plans, or all-hazard plans, to respond to a variety of emergencies including hazardous substance releases.

### **9730.7 – Western Alaska**

#### *9730.7.1 – General Description*

As defined by Alaska regulations, the Western Alaska Region is that area of the State north of the Bristol Bay Geographic Zone, encompassed by the boundaries of the southernmost boundaries of the Bering Straits Regional Corporation, and Regional Educational Attendance Areas 11 and 5, including adjacent shorelines and state waters, and having as its seaward boundary a line drawn in such a manner that each point on it is 200 nautical miles from the baseline from which the territorial sea is measured.

**Physical Features:** The Western Alaska Geographic Zone is characterized by the two major river systems (Yukon and Kuskokwim) that traverse through the Geographic Zone. Residents along the river depend on these waterways for commercial and subsistence fishing, as well as a means of transportation. The coastal communities likewise rely on the Bering Sea for commercial and subsistence fishing. The area is predominantly wetland tundra in the Yukon-Kuskokwim delta region, transitioning to rolling hills and several mountain ranges further inland.

The Western Alaska Geographic Zone includes the Kuskokwim and Kaiyuh mountain ranges, and the Kilbuck Mountains. The topography of the Western Alaska Geographic Zone is dominated by the Yukon and Kuskokwim Rivers and the marshy alluvial plain known as the Yukon-Kuskokwim Delta. Smaller drainage systems also exist including the Kwethluk, Stony, Aniak, and Goodnews River drainage systems. Permafrost is discontinuous throughout the region. Marine waters associated with the region are comprised of the Kuskokwim, Hazen, Hooper, Kokechik, Scammon, and Pastol Bays and Baird Inlet, and the Bering Sea to the west of the Yukon-Kuskokwim Delta, including Nelson, Nunivak, and St Mathew Islands. The entire marine area lies within the continental shelf.

The Yukon-Kuskokwim Delta is in the transitional climatic zone, with a relatively narrow range of seasonal and diurnal temperatures. Fog, precipitation, and winds frequently occur along the coastline. The weather in the region is the result of storms that move northeast across the Bering Sea and the North Pacific Ocean. Sea ice formation in the Bering Sea begins in October. The ice pack persists through May, although the ice begins to melt, break up, and move northward in April.

**Socio-Economic:** See the community profiles in the Resources Section for specifics regarding socio-economic activities within each community.

Many human activities in the Western Alaska Geographic Zone revolve around the subsistence, recreational, and commercial uses of fish and wildlife. Commercial fishing, trapping, reindeer herding, guided hunting and fishing trips, fur tanning and sewing, and seafood processing are important segments of the local economy. Service-related businesses and government provide the primary sources of wage employment in the region.

Bethel and McGrath are the principal employment centers of the Geographic Zone. Infrastructural development is minimal and the existing road network is minor and local. Most travel within the region is by plane (scheduled and charter), private boat or snow machine (during the winter). There is no connecting road network and the Alaska Marine Highway System does not service the Western Alaska Geographic Zone. The population centers of the region are thus physically isolated from one another. This factor has limited the diversification of the local economies so that they remain closely tied to the regional fish and wildlife resources.

**Oil Activities:** Deliveries of noncrude oils are made to the villages in this area primarily by barges operating from Dutch Harbor or the Cook Inlet Geographic Zone. Deliveries are ice dependent and do not occur as ice forms. Small 300,000-gallon barges operate during the ice-free season to supply interior villages and some villages along the outer coast.

**General:** There are 64 communities in the region, with the majority also identified as federally recognized Native tribes.

**Traffic Patterns:** The majority of petroleum products are transported through the Western Alaska Geographic Zone primarily through fuel barges.

**Occurrence Probability:** Most pollution incidents in the Western Alaska Geographic Zone can be expected to be minor in nature involving spills of diesel oil, lube oil, or gasoline. The probability of a hazardous substance discharge is low. The occurrence of a medium or major oil spill will most likely occur from a fuel barge or large vessel.

Determining response strategies in the Western Alaska Geographic Zone is difficult due to the remote geography. Limited accessibility to the remote areas of the Geographic Zone may place an unwarranted time-delay on response equipment.

#### *9730.7.2 – Local Contacts*

This list of local contacts is not exhaustive, and the LOSC may notify additional parties. Phone numbers are not listed in order of importance and contacts will be made at the discretion of the LOSC. Initial notifications will be made by telephone, with concurrent transmission of any available documents (e.g., SITREPs or other information) by fax or e-mail whenever possible.

### 9730.7.3 – Logistics

The Western Alaska Geographic Zone’s limited road, water and air transportation capability severely limits the ability to transport significant quantities of equipment and personnel to and from cities in the

Geographic Zone. After transport to existing airports, equipment may need to be transferred to vessels for on-scene deployment.

Small charter aircraft, both fixed wing and helicopters, will be the main method of rapidly transporting responders to the scene. If weather prevents flying or if a large number of personnel are involved, then in-region passenger vessels will be used. Workers brought in from outside the region will most likely arrive on scheduled Alaska Airlines flights into Bethel or via chartered aircraft. These workers can then be shuttled to the scene by a combination of aircraft and vessels.

Response equipment can be dispatched to the scene by a combination of USCG and private charter aircraft and vessel transport. A limited number of fishing vessels operate in the region and these vessels are dependent on seasonal ice conditions.

#### WESTERN ALASKA - POTENTIAL STAGING AREAS

\* Also, consult/coordinate with airport manager prior to establishing a staging area at the airport facility.

Barges may also be used for marine-based staging areas/command posts.

#### *9730.7.4 – Hazmat Supplemental*

There are no Level A Hazmat response teams in the Western Alaska Geographic Zone. In the event of a hazardous substance release, the ADEC should be contacted and they can take action to activate the Statewide Hazmat Response Team. This formally agreed arrangement allows ADEC to request a Level A

Hazmat team to respond to an event anywhere in the state, as long as the requested Hazmat Team can spare the services of the equipment and trained personnel.

In addition, several of the larger industrial facilities within the Geographic Zone are required to have Risk Management Plans (RMPs) for chemicals exceeding threshold quantities under 40 CFR Part 68 regulations. The RMPs contain emergency response plans for mitigating facility releases. Large bulk fuel production and storage facilities within the Geographic Zone also are required to maintain Facility Response Plans and specific levels of response equipment to mitigate oil releases in accordance 40 CFR Part 112.20 regulations.

Several communities in the Western Alaska Geographic Zone have developed and maintain local emergency management plans, or all-hazard plans, to respond to a variety of emergencies including hazardous substance releases.

#### **9740 – Geographic Response Strategies**

The Geographic Response Strategies provide unified (public, responders, and agencies) priorities and response tactics for the protection of selected sensitive areas for assisting first responders to an oil spill. The GRS list the sensitive resources of an area and the response strategies, equipment, personnel and logistical information necessary to protect the identified sensitive areas. Because the Alaska Department of Environmental Conservation, the Environmental Protection Agency, and the USCG already have approved the GRS, they can serve as pre-approved strategies for the Unified Command during the emergency phase of an oil spill response.

Implementation of these Geographic Response Strategies is the third phase of an oil spill response. The first and primary phase of the response is to contain and remove the oil at the scene of the spill or while it is still on the open water, thereby reducing or eliminating impact on shorelines or sensitive habitats. If some of the spilled oil escapes this tactic, the second phase, which is no less important, is to intercept, contain and remove the oil in the nearshore area. The intent of phase two is the same as phase one: remove the spilled oil before it affects sensitive environments. If phases one and two are not fully successful, phase three is to protect sensitive areas in the path of the oil. Phase three efforts endeavor to protect the selected sensitive areas from the impacts of a spill or to minimize that impact to the maximum extent practical.

The sites selected for development of Geographic Response Strategies are not meant to be exclusive; other sensitive sites may require protection during any given oil spill. The fact that a GRS may not have been developed for a certain sensitive site does not mean that site should not be protected if it is threatened by an oil spill. Sensitive areas include not only locations of environmental concern, but those of cultural or human use value, as well.

These GRS are intended to be flexible to allow spill responders to modify them, as necessary, to fit the prevailing conditions at the time of a spill. Seasonal constraints, such as ice or weather, may preclude implementation of some of the strategies. It is not intended that all the sites be automatically protected at the beginning of a spill, only those that are in the projected path of the spill. The strategies developed for the selected sites were completed with a focus on minimizing environmental damage, utilizing as small a footprint as needed to support the response operations, and selecting sites for equipment deployment that will not cause more damage than the spilled oil.

To test these GRS, each site may be visited and equipment deployed according to the strategy, to ensure that the specified tactics are effective in protecting the resources at risk at the site. Revisions will be made to the GRS that appear in this document, if changes are indicated by site visits, drills, or actual use during spill responses. In the future, strategies may be developed for additional sensitive areas.

**HOW TO USE THESE GRS:** This document is intended for use by response professionals already familiar with spill response techniques.

The GRS contain basic protection and recovery strategies with directions for implementation in the field. Each description contains the strategy objective, deployment depictions, resource sets required to implement the strategy, and deployment considerations and limitations. These general strategies may be adapted to produce a protection scheme for any site in the Arctic and Western Alaska Area. The strategies are taken from the State of Alaska's oil spill response tactics guide, Spill Tactics for Alaska Responders (STAR Manual). Responders should use Reference the [ADEC's STAR Manual](#) for more detailed information about the GRS tactics.

Each Geographic Zone listed below contains a link to the website that contains the site-specific response strategies available to download. An index map on of each sub-section on the webpage shows the location of the selected GRS sites. Each GRS consists of two parts: 1) a graphic showing a map, deployment diagram, picture and implementation notes; and 2) a matrix giving the location description, response strategy, response resources, staging area, site access, natural resources being protected and any special considerations.

**WHO TO CONTACT FOR INPUT:** Comments and recommendations on these GRS are welcomed. Please send your comments to either of the following agencies:

Alaska Department of Environmental Conservation  
Prevention and Emergency Response Program  
555 Cordova Street  
Anchorage, AK 99501

United States USCG  
Captain of the Port, Western Alaska  
Sector Anchorage  
PO Box 5800  
JBER, AK 99505

**HOW THE GRS WERE DEVELOPED:** These GRS were developed through a cooperative, workgroup process involving federal, state, and local spill response experts working with representatives from the oil production and transportation industry, citizens' groups, and natural resource agencies, as well as multiple local stakeholders. Workgroup participants identified all sensitive areas with potential to be classified as "Areas of Major Concern." These potential sites were evaluated by the additional criteria of 1) the risk of being impacted from a water-borne spill; and 2) the feasibility of successfully protecting the site with existing technology. Using this process, the workgroup selected a preliminary list of sites that was released for public input. Feedback on the site selection was solicited from local inhabitants (if applicable), tribal representatives, user groups, environmental organizations, and the public. Based on the feedback received, the workgroup made the final site selections for each zone. Additional sites may be selected in the future.

**SITE SPECIFIC GEOGRAPHIC RESPONSE STRATEGIES:** Geographic response strategies specific to the Arctic and Western Alaska Area are located on the ADEC website: <http://dec.alaska.gov/spar/ppr/response-resources/grs>

#### **9750 – Potential Places of Refuge**

Leaking or disabled vessels may require a sheltered location with adequate water depth to lighter or repair the vessel. Leaking vessels need to be repaired to limit the amount of spilled product. If leaking vessels are not repaired, a spilled product, such as oil, can negatively affect downstream environmental resources and shoreline. Vessels need to be anchored or moored in protected waters to safely make repairs and stop the loss of oil or other hazardous products.

Each vessel incident presents unique circumstances that the UC must address. The goal is to safely repair or salvage a damaged vessel while avoiding or minimizing impacts to local resources. Prior to bringing a vessel into an anchoring or mooring location, the UC will need to consider:

- Status of the vessel
- Public safety
- Environmental resources at risk
- Strategies to protect sensitive areas
- Prevailing winds
- Navigational approach to the mooring site
- Anchoring ground
- Vessel traffic
- Available dock and support facilities
- Available skilled and spill response labor

The USCG Captain of the Port (COTP) – Western Alaska has jurisdiction over approving temporary mooring or anchoring locations for leaking or damaged vessels within this area. The COTP will consult with natural resource trustees and other appropriate stakeholders (e.g., tribal, State, and local government representatives) when deciding where and when to move a stricken vessel.

The most current version of the Guidelines for Places of Refuge Decision-Making is available on the ADEC website at: <http://dec.alaska.gov/spar/ppr/response-resources/ppor>

## DEFINITIONS

- **Activation:** notification by telephone or other expeditious manner or, when required, the assembly of appropriate members of the RRT.
- **Barrel:** a measure of space occupied by 42 U.S. gallons at 60 degrees Fahrenheit.
- **Clean Water Act:** the Federal Water Pollution Control Act of 1972 (P.L. 92-500), as amended by the Clean Water Act of 1977 (P.L. 95-217), as amended (33 U.S.C. 1251 - 1376).
- **Coastal Waters:** For classifying the size of discharge, means the waters of the coastal zone and specified ports and harbors on inland rivers.
- **Command post:** a site located at a safe distance from the spill site where response decisions are made, equipment and manpower deployed, and communications handled. State incident command personnel are located at the command post.
- **Community Right-To-Know:** Federal legislation requiring disclosure of hazardous chemical information to local fire departments, the Local Emergency Planning Commission and the State Emergency Response Commission, and to local citizens upon request (Superfund Amendments and Reauthorization Act of 1986, SARA Title III).

- **Containment and cleanup:** includes all direct and indirect efforts associated with the abatement, restriction of movement or removal of an oil or hazardous substance spill, and the restoration of the environment to its former state, including all incidental administrative costs.
- **Cultural resources:** historic, prehistoric and archaeological resources, which include deposits, structures, ruins, sites, buildings, graves, artifacts, fossils, or other objects of antiquity, that provide information pertaining to the historical or prehistorical culture of people in the State, as well as to the natural history of the State.
- **Damage assessment:** the process of determining and measuring damages and injury to the human environment and natural resources, including cultural resources. Damages include differences between the conditions and use of natural resources and the human environment that would have occurred without the incident, and the conditions and use that ensued following the incident. Damage assessment includes planning for restoration and determining the costs of restoration.
- **Disaster emergency:** the condition declared by proclamation of the Governor or declared by the principal executive officer of a local government unit to designate the imminence or occurrence of a disaster in the state for aiding the affected individuals and local government.
- **Discharge:** spilling, leaking, pumping, pouring, emitting, emptying, or dumping.
- **Catastrophic discharge:** an oil discharge in excess of 100,000 barrels, or any other discharge of oil or hazardous substances, which the Governor determines, represents a grave and substantial threat to the economy or environment of the State.
- **Major discharge:** a major oil discharge is a spill of over 10,000 gallons on inland waters and over 100,000 gallons on coastal waters or any other discharge of oil or a hazardous substance that results in a release that may require evacuation or sheltering of nearby residents or businesses or which causes a serious environmental threat.
- **Medium discharge:** a medium oil discharge is a spill between 100 and 10,000 gallons on inland waters and 1000 to 100,000 gallons on coastal waters or any other discharge of oil or a hazardous substance which results in a localized release that may threaten the health and safety of people and emergency workers in the immediate area of the spill and/or present an environmental threat.
- **Minor discharge:** a minor oil discharge is a spill of less than 100 gallons on inland waters and less than 1000 gallons on coastal waters or any other discharge of oil or a hazardous substance that does not threaten public health, safety or the environment.
- **Dispersant:** a chemical agent used to enhance the breakup of concentrations of spilled oil into droplets, thereby promoting the mixing of oil into the water column with the intent to accelerate dilution and degradation rates.
- **Emergency Operations Center (EOC):** the pre-designated site from where State and local governments direct and manage off-scene logistics support to on-scene emergency operations.

- **First Federal Official:** the first federal representative of a participating agency of the National Response Team (NRT) to arrive at the scene of a discharge or release. This official coordinates activities under this Plan and may initiate, in consultation with the FOSC, any necessary actions until the arrival of the predesignated FOSC. A state with primary jurisdiction over a site covered by a cooperative agreement will act in the stead of the First Federal Official for any incident at the site.
- **Geographic Response Strategy:** Geographic response strategies (GRS) are site-specific spill response methods used to protect sensitive coastal environments from the deleterious effects of petroleum product spills or other hazardous substance spills. GRS provide first responders with specific guidance for rapid deployment of pre-identified actions to protect priority sensitive sites.
- **Hazardous substance:** an element or compound which, when it enters into the atmosphere or in or upon the water or surface land of the state, presents an imminent and substantial danger to the public health or welfare, including but not limited to fish, animals, vegetation, or any part of the natural habitat in which they are found. (*Under State of Alaska law, oil is considered a hazardous substance.*).
- **HAZWOPER Training:** training required by 29 CFR 1910.120 for personnel involved in post emergency response operations at which personnel may be exposed to hazardous substances.
- **Human environment:** the social and economic systems, public health, and physical infrastructure of the state. Population, employment, income, subsistence use, government services, government revenues, and their cultural contexts are elements of social and economic systems. Public facilities, utilities, roads, airports, ports, buildings, and communication systems are elements of physical infrastructure. Private facilities are included when the facility services a public purpose.
- **Incident Action Plan:** the strategic goals, tactical objectives, and support requirements for responding to an incident. All incidents require an action plan.
- **Incident Command System (ICS):** the management tool to coordinate the efficient use of facilities, equipment, personnel, procedures, and communications. An incident command system is designed to begin developing from the time an incident occurs until the requirement for management and operations no longer exists.
- **Inland waters:** For classifying the size of discharges, means those waters of the United States in the inland zone and specified ports and harbors on inland rivers.
- **Local Emergency Planning Committee (LEPC):** a group of local representatives appointed by the State Emergency Response Commission to prepare local oil and hazardous materials spill response plans as per the mandates of the federal Emergency Planning and Community Right-to-Know Act and in coordination with local jurisdictional boundaries.
- **Local Emergency Planning District (LEPD):** geographical planning districts established by the State Emergency Response Commission under the federal Emergency Planning and Community Right-to-Know Act.

- **Local Emergency Response Plan (LERP):** a plan developed for an LEPD by a Local Emergency Planning Committee under the federal Emergency Planning and Community Right-to-Know Act. LERP's must be reviewed by the State Emergency Response Commission.
- **Local government:** a borough or city incorporated under Alaska law.
- **Multiagency Coordination Committee (MAC):** an ICS term that refers to the functions and activities of representatives of involved agencies and/or jurisdictions who come together to make decisions regarding the prioritizing of incidents and the sharing and use of critical resources during an emergency response. The MAC organization oversees the incident commander, but is not a part of the on-scene response nor is it involved in developing operational tactics. However, the incident command system used in Alaska for responses to oil and hazardous substance discharges does not employ MAC organization, but instead uses a Regional Stakeholder Committee (RSC) that works with the Unified Command.
- **Municipality:** a borough or city incorporated under Alaska law.
- **Natural resources:** land, fish, wildlife, biota, air, water, ground water, drinking water supplies, and other such resources belonging to, managed by, held in trust by, appertaining to or otherwise controlled by the State, federal government, private parties or a municipality.
- **Oil:** liquid hydrocarbon of any kind and in any form, whether crude, refined, or a petroleum by-product, including but not limited to petroleum, fuel oil, gasoline, lubricating oils, oily sludge, oil refuse, oil mixed with other wastes, crude oils, liquefied natural gas, propane, butane, or other liquid hydrocarbons regardless of specific gravity.
- **On-Scene Coordinator (OSC):** the official at the event responsible for coordinating response activities.
- **Federal On-Scene Coordinator (FOSC):** the federal official predesignated by the USCG or USEPA to coordinate and direct federal responses under Subpart D of the NCP, or the official designated by the lead agency to coordinate and direct removal actions under Subpart E of the NCP. Generally, the EPA will provide the FOSC for discharges or releases into or threatening the inland zone and the USCG shall provide the FOSC for discharges or releases into or threatening the coastal zone. However, if the release is from a facility or vessel under the jurisdiction, custody or control of DOD or DOE, then DOD or DOE will be the lead agency and designate the FOSC. For releases of hazardous substances, pollutants, or contaminants from a vessel or facility under the jurisdiction, custody or control of a federal agency other than the USCG, EPA, DOD or DOE, then that federal agency will provide the FOSC for all removal actions that are not emergencies.
- **Local On-Scene Coordinator (LOSC):** the designated Community Emergency Coordinator under the Local Emergency Response Plan. Where no LERP exists, the police or fire chief or other emergency services official will serve as the LOSC.
- **Responsible Party's On-Scene-Coordinator (RPOSC):** the person designated as incident commander or chief command staff in the facility or vessel contingency plan.

- **State On-Scene Coordinator (SOSC):** the OSC designee of the Alaska Department of Environmental Conservation. Three SOSCs have been predesignated by the ADEC Commissioner.
- **Place of Refuge:** A “place of refuge” is defined as a location where a vessel needing assistance can be temporarily moved to and where actions can then be taken to stabilize the vessel, protect human life, reduce a hazard to navigation, and/or protect sensitive natural resources and/or other uses of the area (e.g., subsistence collection of mussels, commercial fishing, recreational boating). A place of refuge may include constructed harbors, ports, natural embayments, temporary grounding sites, or offshore waters. A vessel moved to a temporary grounding site must be removed after emergency actions are completed. There are no pre-approved places of refuge identified in Alaska.
- **Pollutant or Contaminant:** defined by Section 104 (a)(2) of CERCLA, shall include, but not be limited to, any elements, substances, compound, or mixture, including disease-causing agents, which, after release into the environment and upon exposure, ingestion, inhalation, or assimilation into any organism, either directly from the environment or indirectly by ingesting through the food chain, will or may reasonably be anticipated to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions (including malfunctions in reproduction), or physical deformation in such organisms or their offspring. The term does not include petroleum, including crude oil and any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under Section 101(14)(A)-(F) of CERCLA, nor does it include natural gas, liquefied natural gas and synthetic gas of pipeline quality (or mixture of natural gas and synthetic gas). For purposes of the NCP, the term pollutant or contaminant means any pollutant or contaminant, which may present an imminent and substantial danger to public health or welfare.
- **Prevention and Preparedness:** actions taken by agencies to reduce oil and hazardous substance discharges through policies, programs and authorities.
- **Regional Stakeholder Committee (RSC):** a committee composed of individuals and representatives of entities that may be affected by an emergency incident. The RSC may include local government representatives, community emergency coordinators, Regional Citizens Advisory Council representatives, landowners, leaseholders, and special interest groups. The RSC membership may vary from incident-to-incident and from phase-to-phase. Agencies/organizations that are functioning as part of the overall ICS response structure would not normally be included in the RSC. The RSC does not play a direct role in setting incident priorities or allocating resources, but can advise the Unified Command and provide recommendations or comments on incident priorities and objectives.
- **Remedial investigation:** process undertaken by the lead agency (or responsible party if the responsible party will be developing a cleanup proposal) that emphasizes data collection and site characterization. A remedial investigation is undertaken to determine the nature and extent of the problem presented by the release. This includes sampling and monitoring, as necessary, and includes the gathering of sufficient information to determine the necessity for a proposed extent of remedial action. Part of the remedial investigation involves assessing the source of the contamination at or near the area where the hazardous substances, pollutants, or contaminants were originally located (source control remedial actions) or whether additional actions will be necessary because the hazardous substances, pollutants, or contaminants have migrated from

the area of their original location (management of migration). The remedial investigation is generally performed concurrently and in an interdependent fashion with the feasibility study. However, in certain situations, the lead agency may require potential responsible parties to conclude initial phases of the remedial investigation prior to initiation of the feasibility study.

- **Remedial Project Manager (RPM):** the official designated by the lead agency to coordinate, monitor, or direct remedial or other response actions under the NCP.
- **Responsible party:** any person, operator, or facility that has control over an oil or hazardous substance immediately before entry of the oil or hazardous substance into the atmosphere or in or upon the water, surface, or subsurface land of the State.
- **Restoration:** after injury, the process of returning an ecosystem to its former condition; includes both replacement and acquisition of equivalent resources and services. Although the responsible party is responsible for paying damages for injured resources, federal and State trustee agencies (and not the OSCs) are responsible for evaluating the need for and implementing any necessary restoration programs.
- **State Emergency Response Commission (SERC):** a group of officials appointed by the Governor to implement the provisions of Title III of the Federal Superfund Amendments and Reauthorization Act of 1986 (SARA). The SERC also reviews the State Oil and Hazardous Substance Discharge Prevention and Contingency Plan and Local Emergency Response Plans.
- **Subsistence economy:** an economy in which the customary and traditional uses of fish, wildlife, and plant resources contribute substantially to the social, cultural, and economic welfare of families in the form of food, clothing, transportation, and handicrafts. Sharing of resources, kinship-based production, small-scale technology, and the dissemination of information about subsistence across generational lines are additional characteristics.
- **Volunteer:** means any individual accepted to perform services by the lead agency that has authority to accept volunteer services (examples: Reference 16 U.S.C. 742f(c)). A volunteer is subject to the provisions of the authorizing statute and the NCP.
- **Waters of the State:** includes lakes, bays, sounds, ponds, impoundment reservoirs, springs, wells, rivers, streams, creeks, estuaries, marshes, inlets, passages, canals, the Pacific Ocean, Gulf of Alaska, Bering Sea and Arctic Ocean, within the territorial limits of the State and all other bodies of surface or underground water, natural or artificial, public or private, inland or coastal, fresh or salt, which are wholly or partially in or bordering the State or under jurisdiction of the State.

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                             | of land and 8,023.5 sq. miles of water. The Borough lies in the maritime climate zone. Temperatures range from -9° to 76°F. Annual precipitation is 33 inches and annual snowfall is 52 inches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>History, Culture, &amp; Demographics</b> | According to archaeological evidence, the area has been inhabited by the Unanga since the last ice age. Early contact was with Russian fur traders who sought sea otters in these islands. Whaling, fishing and cannery operations brought an influx of Scandinavian and European fishermen in the early 1900s. During World War II the area was a strategic military site for the Aleutian Campaign, and many locals were evacuated to Ketchikan. The area's rich resources have cultivated an extremely diverse population of non-Natives, Natives and Asians. The Unanga were called "Aleut" by Russian traders. "Unangas" speak the western dialect, and "Unangan" speak the eastern dialect. |
| <b>Economy</b>                              | The Borough's economy is cash-based. Commercial fishing and fish processing dominate and occur almost year-round. 222 borough residents hold commercial fishing permits. Sand Point is home to the largest fishing fleet in the Aleutian Chain. Salmon and pacific cod processing occur at Peter Pan Seafoods (Port Moller and King Cove), Trident Seafoods (Sand Point and Akutan), and Bering Pacific (False Pass). The Peter Pan cannery in King Cove is one of the largest operations under one roof in Alaska. Transportation and other services provide year-round employment.                                                                                                              |

## GENERAL

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>Location and Climate</i></b>                 | Adak is located on Kuluk Bay on Adak Island in the Aleutian Island Chain, approximately 1,300 miles southwest of Anchorage and 350 miles west of Unalaska. Flight time to Anchorage is three hours. Adak is the southern-most community in Alaska, on the latitude of Vancouver Island in Canada, at approximately 51.872°N/176.628610°W. (Sec. 10, T096S, R195W, Seward Meridian) Adak lies in the maritime climate zone, characterized by persistently overcast skies, high winds, and frequent cyclonic storms. Winter squalls produce wind gusts in excess of 100 knots. During the summer, extensive fog forms over the Bering Sea and North Pacific. Average temperatures range from 20° to 60°F, but wind chill factors can be severe. Total precipitation is 64 inches annually, with an average accumulated snowfall of 100 inches, primarily in the mountains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>History, Culture, &amp; Demographics</i></b> | The Aleutian Islands were historically occupied by the Unangas. The once heavily-populated island was eventually abandoned in the early 1800s as the Aleutian Islands hunters followed the Russian fur trade eastward and famine set in on the Andreanof Island group. Yet, they continued to actively hunt and fish around the island over the years, until World War II broke out. Adak Army installations allowed U.S. forces to mount a successful offensive against the Japanese-held islands of Kiska and Attu. After the war, Adak was developed as a Naval Air Station, playing an important role during the Cold War as a submarine surveillance center. Large earthquakes rocked the Island in 1957, 1964 and 1977. At its peak, the station housed 6,000 naval personnel and their families. In 1994, severe military cut-backs occurred, closing family housing and schools. The station officially closed on March 31, 1997 and currently houses civilians. The Aleut Corporation acquired Adak's facilities under a land transfer agreement with the Department of the Interior and the U.S. Navy/Department of Defense. Properties are currently under lease. About 30 families with children relocated to Adak in September 1998, most of them Aleut Corp. shareholders, and the school has reopened. Aleut Corp. is currently developing Adak as a commercial and fishing center. The community formed a Second Class City government in April 2001. |
| <b><i>Economy</i></b>                              | <p>The population of the community consists of 37% Alaska Native or part Native. Since World War II, the U.S. Navy developed outstanding facilities and recreation opportunities at Adak, including an \$18-million hospital built in 1990, a movie theater, roller skating rink, swimming pools, ski lodge, bowling alleys, skeet range, auto hobby shop, photo lab, racquetball and tennis courts; the Aleut Corporation now owns the facilities, but all currently remain closed.</p> <p>A land exchange between Aleut Corp., the U.S. Navy, and the Department of the Interior has transferred most of the naval facilities to the Aleut Corp. A portion of the island remains within the National Maritime National Wildlife Refuge, managed by U.S. Fish &amp; Wildlife. Contractors are performing an environmental cleanup. Adak currently provides a fueling port and crew transfer facility for foreign fishing fleets -- an airport, docks, housing facilities, restaurant, grocery and ship supply store are available. Icicle Seafood's operates an onshore processing facility for Pacific cod, pollock, mackerel, halibut, albacore and brown king crab. Four residents hold commercial fishing permits, primarily for groundfish. Wildlife viewing (seals, otters, caribou), hunting, fishing, hiking, and WWII military installation facilities draws visitors.</p>                                                                                  |

## TRANSPORTATION

|                           |                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Airport Facilities</b> | Adak Airport has a control tower ( <u>not used</u> ) and two asphalt paved runways, both at an elevation of 19': one measures 7,790' long by 200' wide; the other runway measures 7,605' by 200' wide. The city operates the airport terminal.                                                                                           |
| <b>Airline Services</b>   | Alaska Airlines operates passenger service. Grant Aviation provides charter service as requested (from Unalaska).                                                                                                                                                                                                                        |
| <b>Freight</b>            | Alaska Airlines operates cargo jet service.                                                                                                                                                                                                                                                                                              |
| <b>Vessel Support:</b>    | There are three deep water docks and fueling facilities; Adak Marine Services, (subsidiary of Aleut Enterprises) operates the port, Adak Petroleum (subsidiary of Aleut Enterprises) runs the fuel pier. The city has expanded the Sweeper Cove small boat harbor, and seeks further dock expansion, new moorage floats and breakwaters. |

| <b>Location and Climate</b>                 | Akutan is located on Akutan Island in the eastern Aleutians, one of the Krenitzin Islands of the Fox Island group, approximately 35 miles east of Unalaska and 766 air miles southwest of Anchorage, at approximately 54.136°N/165.773°W. (Sec. 11, T070S, R112W, Seward Meridian.) Akutan lies in the maritime climate zone, with mild winters and cool summers. Mean temperatures range from 22° to 55°F. Precipitation averages 28 inches per year. High winds and storms are frequent in the winter, and fog is common in the summer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>History, Culture, &amp; Demographics</b> | <p>Akutan began in 1878 as a fur storage and trading port for the Western Fur &amp; Trading Company; the company's agent established a commercial cod fishing and processing business that quickly attracted nearby Unangan to the community. In 1878, a Russian Orthodox Church and a school were built; the Alexander Nevsky Chapel replaced the original chapel in 1918. The Pacific Whaling Company built a whale processing station across the bay from Akutan in 1912; it was the only whaling station in the Aleutians and operated until 1939. After the Japanese attacked Unalaska in June 1942, the U.S. government evacuated Akutan residents to the Ketchikan area. The village was re-established in 1944, although many villagers chose not to return. This exposure to the outside world brought many changes to the traditional lifestyle and attitudes of the community. The city incorporated in 1979.</p> <p>A federally-recognized tribe is located in the community -- the Native Village of Akutan. The population of the community consists of 16% Alaska Native or part Native. Akutan is a fishing community, and is the site of a traditional Unangan village. Approximately 75 persons are year-round residents; the majority of the population is transient fish processing workers that live in group quarters.</p> |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Economy</b> | Commercial fish processing dominates Akutan's cash-based economy, and many locals are seasonally employed. Trident Seafoods operates a large processing plant west of the City for cod, crab, pollock and fish meal. The population of Akutan can double during processing months. Seven residents hold commercial fishing permits, primarily for halibut and other groundfish. Subsistence foods include seal, salmon, herring, halibut, clams, wild cattle, and game birds |

## TRANSPORTATION

|                           |                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accessibility</b>      | Boats and amphibious aircraft are the only means of transportation into Akutan. High waves may limit accessibility during winter months. The State Ferry arrives from Kodiak bi-monthly between May and October. |
| <b>Airport Facilities</b> | Akutan has no airstrip due to the steep terrain, however, a seaplane base is available and open to the public.                                                                                                   |
| <b>Airline Services</b>   | Daily air service is provided from nearby Unalaska.                                                                                                                                                              |
| <b>Freight</b>            | Cargo is delivered weekly by freighter from Seattle; the city owns and operates a landing craft, the M/V Akutan.                                                                                                 |
| <b>Vessel Support:</b>    | A 200 ft. dock and a small boat mooring basin are available. A new boat harbor will open in 2015 and will provide moorage for 58 vessels ranging up to 165 feet in length.                                       |

## FACILITIES & UTILITIES

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |

| <b>Water &amp; Sewage</b>    | Water is supplied by a local stream and dam, originally constructed in 1927. Water is treated and piped into all homes. Funds have been requested to develop two new water catchment dams, and construct a new 125,000-gal. water storage tank and treatment plant. Sewage is piped to a community septic tank, with effluent discharge through an ocean outfall. Refuse is collected three times a week; a new landfill site and incinerator were recently completed. The city recycles aluminum. Trident Seafoods operates its own water, sewer and electric facilities. |                |

|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location and Climate</b>                 | Atka is located on Atka Island, 1,200 air miles southwest from Anchorage and 350 miles west of Unalaska, at approximately 52.196°N/174.201°W. (Sec. 22, T092S, R176W, Seward Meridian.) Atka lies in the maritime climate zone. Temperatures range from 20° to 60°F. Precipitation averages 60 inches per year and snowfall averages 61 inches per year. There are frequent winds and severe storms in the winter and calm, foggy weather in summer. |
| <b>History, Culture, &amp; Demographics</b> | The island has been occupied by Unangas for at least 2,000 years. Unangas speak the western dialect, known since the Russian era as "Aleuts." Recent archaeological evidence indicates that the present village site may have had human use since prehistoric times. The first contact with Russians occurred in 1747, and Atka became an important trade site and safe harbor for Russians. In                                                      |

## Economy

1787 a number of hunters were enslaved and relocated to the Pribilofs to work in the fur seal harvest. The townsite was settled in the 1860s. After the end of the sea otter hunting era in the late 1800s, Atka had no viable cash economy. Reindeer were introduced to the island in 1914, and during the 1920s, Atka became relatively affluent due to fox farming. After the Japanese attacked Unalaska and seized Attu and Kiska in June 1942, the U.S. Government evacuated Atka residents to the Ketchikan area. Atka was burned to the ground to prevent Japanese forces from using it and advancing. The community was rebuilt by the U.S. Navy after the War and residents were allowed to return. Many Attu villagers, released from imprisonment in Japan in 1945, relocated to Atka. This exposure to the outside world brought many changes in the traditional culture and attitudes in the community. The city incorporated in 1988.

A federally-recognized tribe is located in the community -- the Native Village of Atka IRA. The population of the community consists of 91% Alaska Native or part Native. A traditional Unangas settlement, exposure to the outside world has brought changes to the traditional lifestyle, yet the Aleut language is still spoken in one-fourth of homes. The St. Nicholas Russian Orthodox Church is a central part of village life. Sea lions and other sea mammals are an important part of the subsistence lifestyle, and meat is shared village-wide on an informal basis. The economy is based on subsistence living and wages earned from the halibut fishery. A small local fish processing plant, Atka Pride Seafoods, operates seasonally to serve the local fleet; they currently process halibut and black cod. Nine residents hold commercial fishing permits. A number of offshore fish processors carry out crew changes through Atka. Year-round income opportunities in the village are limited to education- and government-related work. A reindeer herd of over 2,500 head provides a source of meat.

## TRANSPORTATION

|                           |                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------|
| <b>Accessibility</b>      | Accessible by air or sea                                                                       |
| <b>Airport Facilities</b> | Atka has a State-owned 4,500' long by 100' wide asphalt, lighted runway.                       |
| <b>Airline Services</b>   | Scheduled aircraft from Unalaska and chartered flights from Cold Bay or Unalaska.              |
| <b>Freight</b>            | Coastal Transportation provides freight service from May to October.                           |
| <b>Vessel Support:</b>    | A new dock and port facility, operated by the City, were recently completed 5 miles from town. |

|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>History, Culture, &amp; Demographics</b> | average annual snowfall is 55 inches. Wind speeds of 30 mph are common for Cold Bay.<br>Archaeological sites dating to the last ice age indicate the area around Cold Bay was once inhabited by a large Native population and was used by European hunters and trappers throughout the 19th century. Nearby Izembeck Lagoon was named in 1827 by Count Feodor Kutke, after Karl Izembeck, a surgeon aboard the sloop "Moller." During World War II, Cold Bay was the site of the strategic air base Fort Randall, and its newly constructed runway was the largest in the state, at that time and for many years. The city incorporated in 1982.                                                                                                                                                                                                                                                                                                                                 |
| <b>Economy</b>                              | The population of the community consists of 17% Alaska Native or part Native. Subsistence and recreational fishing and hunting are a part of the local culture. Up to 70,000 Canada geese migrate through Cold Bay in the fall. Izembeck Lagoon offers the world's largest eelgrass beds, feeding grounds for more than 100,000 brant during their spring and fall migrations.<br>Cold Bay services the fishing industry and houses a number of federal offices with services focused on Aleutian transportation and wildlife protection. State and federal government and airline support services provide the majority of local employment, and Cold Bay provides services and fuel for the fishing industry. Two residents hold commercial fishing permits. Because of its central location and modern airport with a 10,000' runway, Cold Bay serves as the regional center for air transportation on the Alaska Peninsula and as an international hub for private aircraft. |

#### TRANSPORTATION

|                           |                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accessibility</b>      | Cold Bay is a regional transportation center and provides scheduled flights to surrounding communities.                                                                                    |
| <b>Airport Facilities</b> | A State-owned 10,415' long by 150' wide paved and lighted runway with a 5,126' long by 150' wide paved crosswind runway, an FAA Flight Service Station, and a seaplane base are available. |
| <b>Airline Services</b>   | Scheduled and charter service from Anchorage and local area.                                                                                                                               |
| <b>Freight</b>            | Marine cargo services are available monthly from Seattle, but not from Anchorage.                                                                                                          |
| <b>Vessel Support:</b>    | The community has a dock, but wants to develop a breakwater, boat harbor and boat launch. The State Ferry operates bi-monthly from Kodiak between May and October.                         |

| <b>Housing</b>            | Bear Foot Inn Alaska (532-2327), operates a hotel, restaurant, bar and store. Lodging is also available at Cold Bay Lodge (532-2767); Bay View Inn (532-2022) and R&R Guide Service (532-2797)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Water &amp; Sewage</b> | Water is supplied by one well and stored in a 213,000-gallon tank. Most residents are connected to the piped water and sewer system; a few homes have individual wells and septic systems. The sewage treatment plant can process up to 45,000 gallons a day. In 1999, construction of two new wells, a water treatment building, new water distribution lines, and sewer collection lines was completed. A new city shop was also constructed. Residents transport their own refuse to the landfill, located 1.5 miles north of the City. A feasibility study will determine whether to clean up or replace the old landfill. The ADOT provides firefighting and rescue services. |
| <b>Miscellaneous</b>      | The community has one school, attended by 10 students. Cold Bay is used to visitors and welcomes tourists, fishermen and others coming through this isolated community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Location and Climate</i>                 | False Pass is located on the eastern shore of Unimak Island on a strait connecting the Pacific Gulf of Alaska to the Bering Sea, 646 air miles southwest of Anchorage. The city owns approximately 66 square miles of land and water. False Pass lies at approximately 54.853°N/163.408°W. (Sec. 34, T061S, R094W, Seward Meridian.) The town is in the maritime climate zone. Temperatures generally range from 11° to 55°F. Snowfall averages 56 inches, with total annual precipitation of 33 inches. Prevailing southeast winds are constant and often strong during winter. Fog is common during summer months.                                                                                                                                                                                        |
| <i>History, Culture, &amp; Demographics</i> | The name False Pass is derived from the fact that what appears as a pass from the Pacific Ocean to the Bering Sea is not practical since the Bering side of the strait is extremely shallow and cannot accommodate large vessels. In the early 1900s, a homesteader originally settled the area, which grew with the establishment of a cannery in 1917. Natives emigrated from Morzhovoi, Sanak Island and Ikatan when the cannery was built. The cannery operated continuously, except for 1973 - 1976, when two hard winters depleted the fish resources; Peter Pan Seafoods subsequently purchased the cannery, but it was destroyed by fire in March 1981 and not rebuilt. A post office was established in 1921; the city incorporated in 1990.                                                       |
| <i>Economy</i>                              | A federally recognized tribe is located in the community -- the False Pass Tribal Council. The population of the community consists of 66% Alaska Native or part Native. The community is primarily Unangan. Fishing, fish processing and subsistence activities are the mainstays of the lifestyle. The sale of alcohol is restricted to the package store.<br>Commercial salmon fishing and fishing services drive the local economy. False Pass is an important refueling stop for Bristol Bay and Bering Sea fishing fleets. Bering Pacific and Peter Pan Seafoods process the commercial catch. Eleven residents hold commercial fishing permits. Cash income is supplemented by subsistence hunting and fishing; salmon, halibut, geese, caribou, seals and wild cattle on Sanak Island are utilized. |

## TRANSPORTATION

|                           |                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Accessibility</i>      | Boats and aircraft provide the only means of transportation into False Pass.                                                                                                |
| <i>Airport Facilities</i> | A State-owned 2,150' long by 60' wide gravel airstrip and a seaplane base are available.                                                                                    |
| <i>Airline Services</i>   | Mail and passenger flights arrive three times weekly.                                                                                                                       |
| <i>Freight</i>            | Cargo barges are available from Seattle. No local taxi or delivery services exist in False Pass. The State Ferry operates once a month between May and October from Kodiak. |
| <i>Vessel Support:</i>    | Construction of a new small boat harbor was completed in 2009.                                                                                                              |

| <b>Fuel Storage</b>          | Peter Pan Seafoods (321,700 gallons); City of False Pass (34,000 gallons); Aleutians East Schools (968 gallons)                                                                                                                                                                                                                                                                                                                                                                         |                |
| <b>Housing</b>               | Accommodations are limited: there is one bed and breakfast; bunkhouse rooms may be available seasonally at Bering Pacific or Peter Pan fish processors.                                                                                                                                                                                                                                                                                                                                 |                |
| <b>Water &amp; Sewage</b>    | Water is derived from a nearby spring and reservoir, treated and stored in a 60,000-gallon tank; most homes are connected to the piped water system. All homes are fully plumbed. Residents use individual septic tanks for sewage disposal; the city operates a septic sludge tanker and sludge disposal site. Wastewater from seafood processing flows directly into an outfall line. Recent water system improvements include an enlarged dam and a second 60,000-gallon water tank. |                |
| <b>Miscellaneous</b>         | The community has one school, attended by 5 students. The city collects refuse twice a week.                                                                                                                                                                                                                                                                                                                                                                                            |                |

| <b><i>Location and Climate</i></b>                 | King Cove is located on the south side of the Alaska Peninsula, on a sand spit fronting Deer Passage and Deer Island. It is 18 miles southeast of Cold Bay, 625 miles southwest of Anchorage, and lies at approximately 55.061°N/162.310°W. (Sec. 22, T059S, R086W, Seward Meridian.) King Cove is in the maritime climate zone. Temperatures average 25° to 55°F, with extremes from -9° to 76°F. Snowfall averages 52 inches, and total annual precipitation is 33 inches. Fog during summer and high winds during winter can limit accessibility.                                                                                                                                                                                                                                                                                                              |
| <b><i>History, Culture, &amp; Demographics</i></b> | King Cove was founded in 1911 when Pacific American Fisheries built a salmon cannery. Early settlers were Scandinavian, European and Unangan fishermen. Of the first ten founding families, five consisted of a European father and an Aleut mother. The city incorporated in 1949. The cannery operated continuously between 1911 and 1976, when it was partially destroyed by fire, but the adoption of the 200-mile fisheries limit spurred rebuilding. King Cove remains tied to fishing and fish processing.<br><br>A federally-recognized tribe is located in the community -- the Agdaagux Tribe of King Cove. The population of the community consists of 48% Alaska Native or part Native. King Cove is a mixed non-Native and Unangan community. Scandinavians have historically had a large influence on the cultural, economic and social structures. |
| <b><i>Economy</i></b>                              | King Cove's economy depends almost completely on the year-round commercial fishing and seafood processing industries. The Peter Pan Seafoods facility is one of the largest cannery operations under one roof in Alaska. Up to 500 non-residents are brought in to work the cannery as needed. Sixty-two residents hold commercial fishing permits. Income is supplemented by subsistence activities; salmon, caribou, geese and ptarmigan provide food sources.                                                                                                                                                                                                                                                                                                                                                                                                  |

## TRANSPORTATION

|                                  |                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>Accessibility</i></b>      | King Cove is accessible only by air and sea.                                                                                                                                                           |
| <b><i>Airport Facilities</i></b> | A State-owned 3,500' long by 100' wide gravel runway is available, but unattended, no fuel, no airport facilities, and runway conditions not monitored – visual inspection recommended prior to using. |
| <b><i>Airline Services</i></b>   | Scheduled or chartered aircraft from Cold Bay or Sand Point.                                                                                                                                           |
| <b><i>Freight</i></b>            | Air and marine cargo capabilities available.                                                                                                                                                           |

|                        |                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Vessel Support:</b> | The ferry and marine cargo services use one of three docks owned by Peter Pan Seafoods. The city operates a deep water dock. The North Harbor provides moorage for 90 boats and is ice-free all year. The Corps of Engineers and Aleutians East Borough constructed the new Babe Newman Harbor and breakwater; the harbor, operated by the city, provides additional moorage for 60' to 150' fishing vessels. |

| <b>Housing</b>               | Fleets Inn (497-2312)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                       |
| <b>Water &amp; Sewage</b>    | Water is supplied by Ram Creek with a sheetpile dam that stores about 980,000 gallons of unfiltered water. A well field and storage tank is located at Delta Creek. All residents are connected to the piped water system and homes are fully plumbed. A piped sewage collection system connects all homes and facilities to central septic tanks. Two lift stations and tanks provide primary (20,000 gallons) and secondary treatment (84,000 gallons) of waste, with discharge through an outfall line. |                       |
| <b>Miscellaneous</b>         | The community has one school, attended by 110 students.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                       |

| <b>Location and Climate</b>                 | Nelson Lagoon is located on the northern coast of the Alaska Peninsula, on a narrow sand spit that separates the lagoon from the Bering Sea. It is 580 miles southwest of Anchorage and lies at approximately 56.001°N/161.202°W. (Sec. 25, T048S, R077W, Seward Meridian.) Nelson Lagoon is in the maritime climate zone, with a constant prevailing wind of 20 to 25 mph. Frequent and dramatic weather changes can occur. Temperatures average 25° to 50°F, with a range from -15° to 75°F. Snowfall averages 56 inches, with a total annual precipitation of 33 inches.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>History, Culture, &amp; Demographics</b> | Nelson Lagoon has been used historically as a Unangan summer fish camp. The resources of the lagoon and nearby Bear River are excellent. The lagoon was named in 1882 for Edward William Nelson of the U.S. Signal Corps, an explorer in the Yukon Delta region between 1877 and 1920. A salmon saltery operated from 1906 to 1917, which attracted Scandinavian fishermen, but there has been no cannery since then. Year-round occupation of the community began in 1965 when a school was built.<br><br>A federally recognized tribe is located in the community, the Native Village of Nelson Lagoon. The population of the community consists of 82% Alaska Native or part Native. The culture is focused on commercial fishing and subsistence activities. There is a strong community pride and loyalty among the residents, with a desire to maintain their lifestyle with slow, monitored growth and development that can be well managed by the residents. |
| <b>Economy</b>                              | Nelson Lagoon is situated in the middle of a rich and productive salmon fisheries area; 24 residents hold commercial fishing permits, primarily salmon gillnet. Subsistence activities balance the seasonal nature of the fishery. Some trapping                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

occurs. Residents are interested in developing a small seafood processing and cold storage facility

#### TRANSPORTATION

| <b>Water &amp; Sewage</b>    | Water comes from a lake about 10 miles from Nelson Lagoon and is treated; water storage capacity is 600,000 gallons. All homes are connected to the piped water system. Individual septic systems enable households to have complete plumbing. The water system needs major improvements, including repair of the distribution system and a new storage tank. |                |
| <b>Miscellaneous</b>         | The community has one school, attended by 18 students. There are no garbage collection services, but a landfill is available.                                                                                                                                                                                                                                 |                |

| <b>Location and Climate</b>                 | Nikolski is located on Nikolski Bay, off the southwest end of Umnak Island, one of the Fox Islands. It lies 116 air miles west of Unalaska, 900 air miles from Anchorage, at approximately 52.938°N/168.867°W. (Sec. 04, T084S, R136W, Seward Meridian.) Nikolski is in a maritime climate zone. Temperatures generally range from 11° to 65°F. Snowfall averages 41 inches; total precipitation is 21 inches. Strong winds are frequent during the winter and fog during the summer, which limits accessibility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>History, Culture, &amp; Demographics</b> | <p>Nikolski is reputed by some to be the oldest continuously occupied community in the world. Archaeological evidence from Ananiuliak Island, on the north side of Nikolski Bay, dates as far back as 8,500 years ago. The Chaluka archaeological site in the village of Nikolski indicates 4,000 years of virtually continuous occupation. People were living in Nikolski before the pyramids were built, the Mayan calendar was invented, or the Chinese language was written. In 1834, it was the site of sea otter hunting, and was recorded by the Russians as "Recheshnoe," which means "river." In 1920, a boom in fox farming occurred. The local Unangan became affluent enough to purchase a relatively large boat, the "Umnak Native," though it met shipwreck in 1933. The Aleutian Livestock Company established a sheep ranch in 1926. In June 1942, after the Japanese attacked Unalaska and seized Attu and Kiska, residents were evacuated to the Ketchikan area. Locals were allowed to return in 1944, but the exposure to the outside world brought about many changes in the traditional lifestyle and community attitudes. In the 1950s, the Air Force constructed a White Alice radar communication site here, which provided some jobs, but it was abandoned in 1977.</p> <p>A federally-recognized tribe is located in the community -- the Native Village of Nikolski. The population of the community consists of 69% Alaska Native or part Native. Residents are known as Unangan, and Aleut is spoken in three-quarters of all homes. Subsistence activities, sheep and cattle raising, and fishing-related employment sustain the community.</p> |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Economy</b> | Most residents support themselves by working outside the village at crab canneries and on processing ships. The lack of a harbor and dock has limited fisheries-related activities. The village is interested in developing a small value-added fish processing plant and a sport-fishing lodge to attract new and former residents, who left Nikolski for economic reasons. The Aleutian Pribilof Island Community Development Association recently purchased a sport-fishing charter boat. Sheep, cattle and horses graze over much of the island. Income is supplemented by subsistence activities, which provide a substantial part of the villagers' diets; salmon, halibut, seals and ducks are utilized. |

#### TRANSPORTATION

|                           |                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accessibility</b>      | By air or sea only.                                                                                                                             |
| <b>Airport Facilities</b> | Nikolski has a 3,500' unlighted gravel runway owned by Chaluka Corporation.                                                                     |
| <b>Airline Services</b>   | Passenger, mail and cargo service available thru scheduled or charter flights from Dutch Harbor. Rain and wind often close the gravel airstrip. |
| <b>Freight</b>            | There are no landings, piers or port facilities for ships.                                                                                      |
| <b>Vessel Support:</b>    | Barges deliver cargo once or twice a year; goods and passengers are lightered three miles to the beach.                                         |

| <b>Location and Climate</b>                 | St. George is located on the northeast shore of St. George Island, the southernmost of five islands in the Pribilofs, 47 miles south of St. Paul Island, 750 air miles west of Anchorage and 250 miles northwest of Unalaska. It lies at approximately 56.600°N/169.542°W. (Sec. 29, T041S, R129W, Seward Meridian.) Over 210 species of birds nest on the cliffs of St. George Island. The climate of St. George is controlled by the cold waters of the Bering Sea. The maritime location results in cool weather year round and a narrow range of mean temperatures varying from 24° to 52°F. Average precipitation is 23 inches, with 57 inches of snowfall. Cloudy, foggy weather is common during summer months.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>History, Culture, &amp; Demographics</b> | St. George was discovered in 1786 by Gavril Pribilof of the Russian Lebedov Lastochkin Co. while looking for the famed northern fur seal breeding grounds. The island was named Sveti Georgiy, and its larger neighbor to the north was originally called St. Peter and St. Paul Island. The Russian American Company enslaved Aleut hunters from Siberia, Unalaska and Atka and relocated them to St. George and St. Paul to harvest the fur seal. Between 1870 and 1910, the U.S. Government leased the Pribilof Islands to private companies, who provided housing, food and medical care to the Aleuts in exchange for work in the fur seal plant. In 1910, the U.S. Bureau of Fisheries took control of the islands, but poverty conditions ensued due to over-harvesting of the seals. During World War II, residents were moved to Funtler Bay in Southeast Alaska as part of the area-wide evacuation; unlike Natives evacuated to other areas, they were confined to an abandoned cannery and mine camp. In 1979, the Pribilof Aleuts received \$8.5 million in partial compensation for the unfair and unjust treatment they were subjected to under federal administration between 1870 and 1946. In 1983, with |

## Economy

the end of the commercial seal harvest and ensuing withdrawal from the islands, the U.S. government provided \$8 million for St. George and \$12 million for St. Paul to help develop and diversify the local economy. Today, residents are working to develop commercial fisheries and tourism. The city incorporated in 1983.

A federally recognized tribe is located in the community -- the St. George Island Traditional Council. Predominantly Aleut and Eskimo, the population of the community consists of 92% Alaska Native or part Native. The Pribilof Islands seal population and the community's dependence on it has been a major influence on the local culture; more than a million fur seals congregate on the islands every summer, though the numbers have been declining inexplicably in recent years. Until terminated in 1983, the federally controlled fur seal industry dominated the economy of the Pribilof communities of St. Paul and St. George; the two communities remain closely tied today. Currently, government positions and commercial fishing provide most employment. Puffin Seafoods and Snopac Products operate in St. George. The St. George Aquaculture Assoc. has salmon and shellfish programs. Eleven residents hold commercial fishing permits. Villagers harvest 500 fur seals each year for subsistence purposes. Halibut, reindeer, marine invertebrates, plants and berries also contribute to the local diet.

## TRANSPORTATION

|                           |                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accessibility</b>      | St. George is accessible only by air and sea                                                                                                            |
| <b>Airport Facilities</b> | There are two airstrips, one owned by the city and a State-owned airport with a 4982' long by 150' wide gravel runway.                                  |
| <b>Airline Services</b>   | Scheduled flights are provided to St. Paul and the mainland.                                                                                            |
| <b>Freight</b>            | Most freight and supplies are delivered by ship from Anchorage on a monthly or bimonthly schedule; cargo from Seattle arrives five or six times a year. |
| <b>Vessel Support:</b>    | There are three docks; one operated by the village corporation, and an inner harbor and dock in Zapadni Bay, 5 miles from town.                         |

| <b><i>Location and Climate</i></b>                 | <p>St. Paul is located on a narrow peninsula on the southern tip of St. Paul Island, the largest of five islands in the Pribilof's. It lies 47 miles north of St. George Island, 240 miles north of the Aleutian Islands, and 750 air miles west of Anchorage, at approximately 57.122°N/170.275°W. (Sec. 25, T035S, R132W, Seward Meridian.)</p> <p>The climate of St. Paul is arctic maritime with cool weather year-round and a narrow range of mean temperatures, varying from 19° to 51°F. Average precipitation is 25 inches, with snowfall of 56 inches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>History, Culture, &amp; Demographics</i></b> | <p>The Pribilof's were discovered in 1786 by Russian fur traders. They landed first on St. George, then named the larger island to the north St. Peter and St. Paul Island. In 1788, the Russian American Company enslaved and relocated Aleuts from Siberia, Atka and Unalaska to the Pribilof's to hunt fur seals; their descendants live on the two islands today. In 1870, the Alaska Commercial Company was awarded a 20-year sealing lease by the U.S. Government to provide housing, food and medical care to the Aleuts in exchange for seal harvesting. In 1890, a second 20-year lease was awarded to the North American Commercial Company, however, fur seals had been severely over-harvested and poverty ensued. The 1910 Fur Seal Act ended private leasing on the islands and placed the community and fur seals under the U.S. Bureau of Fisheries. Food and clothing were scarce, social and racial segregation were practiced, and working conditions were poor. During World War II, Pribilof Aleuts were moved to Funtier Bay in Southeast Alaska as part of the area-wide evacuation; unlike Natives evacuated to other areas, they were confined to an abandoned cannery and mine camp. In 1979, the Aleut Islanders received \$8.5 million in partial compensation for the unfair and unjust treatment they were subject to under federal administration between 1870 and 1946. In 1983, Congress passed the Fur Seal Act Amendments, which ended government control of the commercial seal harvest and the federal presence on the island. Responsibility for providing community services and management of the fur seals was left to local entities; the U.S. government provided \$8 million for St. George and \$12 million for St. Paul to help develop and diversify the local economy. Commercial harvesting on St. Paul ceased in 1985; ownership of fur seal pelts is now prohibited, except for subsistence purposes.</p> |
| <b><i>Economy</i></b>                              | <p>A federally recognized tribe is located in the community -- the Aleut Community of St. Paul Island. The population consists of 87% Alaska Native or part Native, predominantly Aleut and Eskimo. Although subsistence has not historically been the focus of the local culture, today halibut and seal are shared and exchanged with relatives living in other communities for salmon and reindeer. The Russian Orthodox Church plays a strong role in community cohesiveness.</p> <p>The federally controlled fur seal industry dominated the economy of the Pribilof's until 1983. St. Paul is a port for the Central Bering Sea fishing fleet, and major harbor improvements have fueled economic growth. Trident Seafoods and Icicle Seafoods process cod, crab, halibut and other seafood in St. Paul; the community is seeking funds to develop a halibut processing facility. Several offshore processors are serviced out of St. Paul. Thirty residents hold commercial fishing permit. Fur seal rookeries and more than 210 species of nesting sea birds attract almost 700 tourists annually. There is a reindeer herd on the island from a previous commercial venture. Residents subsist on halibut, fur seals (1,645 may be taken each year), reindeer, marine invertebrates, plants and berries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Fuel Storage</b>          | TDX Corp. (1,573,200 gallons); City of Saint Paul (1,849,890 gallons); Pribilof Island Schools (3,000 gallons); Pribilof Island Processors (1,900 gallons); City Electric (12,100 gallons); Reeve Aleutian Airways (10,200 gallons); Trident Seafoods (12,300 gallons); USCG (300,800 gallons)                                                                                                                                                                                                                           |                |
| <b>Housing</b>               | King Eider Hotel (546-2477) with laundry and shower facilities for guests.                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |
| <b>Water &amp; Sewage</b>    | Water is supplied by wells and an aquifer and is then treated; there are two new wooden tanks; one 500,000 gallon and one 300,000 gallon. All 167 homes and facilities are fully plumbed and connected to the piped water and sewer system. An ocean outfall line handles seafood processing waste.                                                                                                                                                                                                                      |                |
| <b>Miscellaneous</b>         | The community has one school, attended by 100 students. The city collects refuse; the village tribe operates a recycling program, which is currently on hold. A landfill, incinerator, sludge and oil disposal site has recently been completed. A \$3 million power plant came online in 2000. A small wind turbine provides power and hot water to the village office, but it is not connected to the power grid; the village corporation has three turbines and more are planned. The community library has wireless. |                |

#### SPILL RESPONSE SUPPORT

*(Contact local officials to determine possibility of using community facilities.)*

#### GENERAL

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location and Climate</b>                 | Sand Point is located on Humboldt Harbor on Popof Island, off the Alaska Peninsula, 570 air miles from Anchorage. It lies at approximately 55.340°N/160.497°W. (Sec. 08, T056S, R073W, Seward Meridian.) Sand Point is in the maritime climate zone. Temperatures range from -9° to 76°F. Snowfall averages 52 inches, with total annual precipitation at 33 inches.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>History, Culture, &amp; Demographics</b> | <p>A San Francisco fishing company founded Sand Point in 1898 as a trading post and cod fishing station. Aleuts from surrounding villages and Scandinavian fishermen were the first residents. Sand Point served as a repair and supply center for gold mining during the early 1900s, but fish processing became the dominant activity in the 1930s. The St. Nicholas Chapel, a Russian Orthodox church built in 1933, is now on the National Register of Historical Places. Aleutian Cold Storage built a halibut plant in 1946. The city incorporated in 1966.</p> <p>A federally recognized tribe is located in the community -- the Qagan Tayagungin Tribe. The population of the community consists of 44% Alaska Native or part</p> |

### ***Economy***

Native, primarily of Aleut decent. Sand Point is characterized as self-sufficient and progressive, with commercial fishing activities at the heart of the local culture. There is a large transient population for fishing and cannery work. Many of the shareholders of Pauloff Harbor and Unga now live in Sand Point.

Sand Point is home to the largest fishing fleet in the Aleutian Chain. The State provides regional services through public safety, fish and game, and the court system. Trident Seafoods operates a major bottom fish, pollock, salmon and fish meal plant and provides fuel and other services. Peter Pan Seafoods owns a storage and transfer station. Locals participate in subsistence consumption, including fish and caribou, and 116 residents hold commercial fishing permits.

## **TRANSPORTATION**

### ***Accessibility***

Direct flights to Anchorage are available.

### ***Airport Facilities***

Sand Point offers a State-owned airport with a 5,213' long by 150' wide paved runway. Runway expansion and airport road paving is planned. CAUTION: an 80 – 120 ft. cliff on east side of runway.

### ***Airline Services***

PenAir

### ***Freight***

Regular barge services supply the community.

### ***Vessel Support:***

Marine facilities include a 25-acre boat harbor with four docks, 134 boat slips, a harbormaster office, barge off-loading area, and a 150-ton lift. The Robert E. Galovin small boat harbor encompasses 25 acres of waterfront with four docks and approximately 130 boat slips. The State Ferry operates bi-monthly between May and October.

## **FACILITIES & UTILITIES**

### ***Telephone***

Interior Telephone Co: (1-800-478-3127); AT&T:(1-800-288-2020); GCI: (1-800-880-4800 / [www.gci.net](http://www.gci.net))

### ***Wireless and Internet***

GCI: (1-800-880-4800 / [www.gci.net](http://www.gci.net)); Arctic Net/TelAlaska, Inc: ([www.arctic.net](http://www.arctic.net))

### ***TV Stations***

ARCS

### ***Radio Stations***

KSDP-AM

### ***Cable Provider***

None

### ***Teleconferencing***

Alaska Teleconferencing Network

### ***Electricity***

TDX Power

### ***Fuel***

Diesel, and unleaded gasoline.

### ***Fuel Storage***

Trident Seafoods (841,932 gallons); Shumagin Distributors (1,000 gallons); City of Sand Point (1,000 gallons); Peter Pan Seafoods (1,000 gallons); Reeve Aleutian Airways (1,500 gallons); Aleutian Commercial (2,350 gallons); Sand Point Electric (40,000 gallons)

### ***Housing***

Anchor Inn Motel; Trident Seafoods Inc.; Hodges B&B.

### ***Water & Sewage***

Water is derived from Humbolt Creek and treated. The city operates a piped water and sewer system serving 170 households and 22 businesses; all are fully plumbed. Trident Seafoods has first water rights; the city has requested funds to develop a new groundwater source.

### ***Miscellaneous***

The community has one school, attended by 119 students. Trident Seafoods operates its own power generation facility.

|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location and Climate</b>                 | Eareckson Air Force Station, or Shemya Station, is located on Shemya Island on the western end of the Aleutian Chain, at approximately 52.724°N/174.112°E. (Sec. 14, T086S, R257W, Seward Meridian.) Shemya Station is located in the Aleutian Islands Recording District. Shemya Station is in a maritime climate zone. Average temperatures range from 11° to 65°F. Snowfall averages 41 inches; total annual precipitation is 21 inches.                                                 |
| <b>History, Culture, &amp; Demographics</b> | The entire group of islands was called Semichi by the Russians. Shemya Island is likely the same island called St. Abraham by Vitus Bering in 1741. The air station was developed during World War II as an Army Air base, and later became an Air Force intelligence site. At its peak, Shemya Station housed over 1,100 personnel; by 1980, the workforce had been reduced to 600. Shemya Station was closed in 1995; there is currently a small group of caretakers residing on the base |
| <b>Economy</b>                              | Eareckson Air Force Station is closed. Residents are employed under contract as caretakers of the facility.                                                                                                                                                                                                                                                                                                                                                                                 |

#### **TRANSPORTATION**

|                           |                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accessibility</b>      | Shemya Station is a military base with access strictly controlled by the U.S. Air Force and is restricted to military craft or emergency landings. Visitors must be on official military business to go to Shemya Station. |
| <b>Airport Facilities</b> | Military permitted only for runway use. Eareckson Air Force Station once maintained a seaplane landing facility; it is restricted to military craft or emergency landings.                                                 |

#### **FACILITIES & UTILITIES**

No community wide facilities or utilities, except for electricity generation by USAF generator, which is operated by USAF and privately.

| <b>Location and Climate</b> | Unalaska overlooks Iliuliuk Bay and Dutch Harbor on Unalaska Island in the Aleutian Chain. It lies 800 air miles from Anchorage, and 1,700 miles northwest of Seattle. The name Dutch Harbor is often applied to the portion of the city on Amaknak Island, which is connected to Unalaska Island by bridge; Dutch Harbor is actually within the boundaries of the City of Unalaska, which lies at approximately 53.874°N/166.537°W. (Sec. 11, T073S, R118W, Seward Meridian.) An arctic maritime climate dominates the area and generates strong winds throughout much of the year. Winter temperatures generally range from 15° to 35°F and summers from 43° to 63°F. Average snowfall is 89 inches, with total annual precipitation of 58 inches. |

***History, Culture, & Demographics***

More than 3,000 Unangan (known since the Russian era as "Aleuts") lived in 24 settlements on Unalaska and Amaknak Islands when first visited by the Russians in 1759. Unalaska became a Russian trading port for the fur seal industry in 1768. In 1787, many hunters and their families were enslaved and relocated by the Russian American Company to the Pribilof Islands to work in the fur seal harvest. In 1825, the Russian Orthodox Church of the Holy Ascension of Christ was constructed; the founding priest, Ivan Veniaminov, composed the first Aleut writing system with local assistance and translated scripture into Aleut. Since Aleuts were not forced to give up their language or culture by the Russian Orthodox priests, the church remained strong in the community. By this time, however, between 1830 and 1840, only 200 to 400 Aleuts lived in Unalaska. In 1880, the Methodist Church opened a school, clinic and the Jesse Lee Home for orphans. The City of Unalaska incorporated in March 1942. On June 3, 1942, Unalaska was attacked by the Japanese; in response the US government interned almost all of the Aleuts from the island in Southeast Alaska for the duration of World War II. The Russian Orthodox Church, nearly destroyed by evacuating U.S. Army troops, is the oldest Russian Orthodox cruciform-style church in North America.

A federally-recognized tribe is located in the community -- the Qawalangin Tribe of Unalaska. The population of the community consists of 9.3% Alaska Native or part Native. Subsistence activities remain important to the Unangan community and many long-term non-Native residents as well. Unalaska has seen rapid growth over the past couple of decades and is now a very culturally-diverse community.

***Economy***

Unalaska's economy is based on commercial fishing, fish processing, and fleet services, such as fuel, repairs and maintenance, trade and transportation. The community enjoys a strategic position as the center of a rich fishing area and as a way-station for transshipment of cargo between Pacific Rim trading partners. The Great Circle shipping route from major west coast ports to the Pacific Rim passes within 50 miles of Unalaska, and Dutch Harbor provides natural protection for fishing vessels and others seeking refuge from foul weather. Onshore and offshore processors provide some local employment, but a significant number of non-resident workers are brought in during the peak season. Westward, UniSea, Alyeska, Icicle, Trident and Harbor Crown Seafoods process the commercial catch. Fifty residents hold commercial fishing permits. Unalaska has a budding tourist industry and a new convention and visitor's bureau. The city boasts two new and highly-praised facilities, the Museum of the Aleutians and the Aleutian WWII Visitors Center, which is part of the Aleutian World War II National Historical Park.

|                                  |                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>Accessibility</i></b>      | Daily scheduled flights serve the community. The State Ferry operates bi-monthly from Kodiak between April and October.                                                                                                                                                                                                                             |
| <b><i>Airport Facilities</i></b> | State-owned 4100' long by 100' wide paved runway; a seaplane base is also available.                                                                                                                                                                                                                                                                |
| <b><i>Airline Services</i></b>   | Scheduled and charter airline from Anchorage.                                                                                                                                                                                                                                                                                                       |
| <b><i>Freight</i></b>            | There are ten major docks in Unalaska; three are operated by the city.                                                                                                                                                                                                                                                                              |
| <b><i>Vessel Support:</i></b>    | A refurbished World War II submarine dock offers ship repair services. The International Port of Dutch Harbor serves fishing and shipping vessels, with 5,200 feet of moorage and 1,232 feet of floating dock. The small boat harbor provides 238 moorage slips. The Carl E. Moses Boat Harbor has 52 slips available for vessels up to 150 feet. . |

| <b>Fuel Storage (Total Capacity)</b> | Delta Western (6,462,492 gallons); North Pacific Fuel (2,445,492 gallons); Westward Seafood (1,023,876 gallons); Capt. Bay (2,520,000 gallons); Resoff (2,661,036 gallons); Offshore Systems 3,287 gallons)                                                                                                                                                                                                                                                           |                |
| <b>Housing</b>                       | The Grand Aleutian and UniSea Inn (581-7307or 581-3844); Carl's Hotel (581-1230)                                                                                                                                                                                                                                                                                                                                                                                      |                |
| <b>Water &amp; Sewage</b>            | A new reservoir at Icy Creek and a dam at Pyramid and Unalaska Creeks supply water, which is chlorinated and stored in a tank. The city seeks to construct a 2-million-gallon back-up storage tank above Ballyhoo Road. All homes and on-shore fish processors are served by the city's piped water system. Piped sewage receives primary treatment before discharge into Unalaska Bay. Nearly all households have plumbing; a few homes use septic tanks or privies. |                |
| <b>Miscellaneous</b>                 | The community has two schools, attended by 389 students. The city has a new Class-1 lined 6-acre landfill and baler; recycling and hazardous waste disposal is provided. All on-shore processors generate their own electrical power.                                                                                                                                                                                                                                 |                |

#### SPILL RESPONSE SUPPORT

*(Contact local officials to determine possibility of using community facilities.)*

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Location and Climate**

Approximately 500 square miles in area, the Bristol Bay Borough is located in Southwest Alaska, at the upper eastern end of Bristol Bay. The Katmai National Park is adjacent to the borough. It lies at approximately 58.720000 North Latitude and -157.000000 West Longitude. Bristol Bay Borough is located in the Kvichak Recording District. The area encompasses 504.9 sq. miles of land and 382.8 sq. miles of water.

Bristol Bay Borough's climate is mainly maritime, characterized by cool, humid, and windy weather. Fog is common during summer months. Average summer temperatures range from 42 to 63 °F. Average winter temperatures range from 29 to 44 °F. Extremes have been recorded, ranging from a low of -46 to a high of 88 °F. Each year, total precipitation averages 20 inches and snowfall averages 45 inches.

**Transportation**

**Accessibility:** Naknek, South Naknek and King Salmon are accessible by air and water via Bristol Bay and the Naknek River. King Salmon is the hub for the area with scheduled and charter flights available from Anchorage. Barge service is available into Naknek and is delivered by a 15.5-mile road connecting to King Salmon. Goods are flown or lightered to South Naknek. During winter, an ice road provides access to South Naknek. Vehicles are the primary means of local transportation; skiffs are used during summer.

**Airport Facilities:** King Salmon is the hub for the area. There are scheduled and charter flights available from Anchorage. There is a 8,901 foot long by 150 foot wide paved, lighted runway and a 4,018' long by 100' wide asphalt/gravel crosswind runway. Smaller airports are located in Naknek and South Naknek. Stretches of the Naknek River are designated for use by float planes. A seaplane base is also located at Lake Brooks, within the Katmai National Park to the east.

**Airline Services:** Alaska Air and Penn Air serve the area (into King Salmon) with several daily flights. From King Salmon, a number of air taxi services provide flights to other communities on the region.

**Freight:** Barge service is available into Naknek and is delivered by a 15.5-mile road connecting to King Salmon. Goods are flown or lightered to South Naknek.

**Vessel Support:** The borough operates the cargo dock at Naknek, which is the port of Bristol Bay. It has 800' of berthing space, a concrete surface, and a couple of cranes. No commercial docking facilities are available at the canneries. Additional docks are operated by the National Park Service, U.S. Fish & Wildlife, Alaska State Troopers

**Spill Response Limitations:** Limited sewer capabilities (June/July).

**Top Two Sensitive Areas to Protect:** River/Naknek River Mouth (salmon habitat); Bristol Bay (fish/wildlife habitat).

### **Economy**

Commercial fishing, processing, government jobs, and transportation services are the mainstays of the economy. Naknek and South Naknek are dependent on fishing and processing, while many King Salmon residents work for the government and air taxi operations. In 2010, 163 borough residents held commercial fishing permits.

### **History, Culture & Demographics**

The region was first settled by Athabascan Indians, Central Yup'ik Eskimos, and Sugpiaq (Aleut-Russian) Eskimos. Hunting and fishing camps along the Naknek River date from 3,000 to 4,000 B.C. In 1818 the first Russian traders arrived. Two years later, the first Russian settlement was established, and in 1841 the Russian Orthodox mission was built at Nushagak. The Russians explored and maintained dominance of the area until the U.S. purchase of Alaska in 1867. U.S. interests were directed primarily at the fur and fishery potential of the region. In 1883, the first salmon cannery in Bristol Bay was opened. In 1890, the first cannery on the Naknek River was opened, and commercial salmon fishing remains the region's primary industry. During World War II, King Salmon Air Force Base was developed. The Bristol Bay Borough was incorporated as the state's first borough in 1962.

Due to the outstanding commercial fishing opportunities, the borough population increases by several thousand during the red salmon season. King Salmon is a departure point for Katmai National Park and Preserve, Brooks Camp, and various fishing and hunting sites.

Borough-wide, the population is 56% native. The Native population is a mixture of Aleuts, Alutiiqs, Yup'ik Eskimos, and Athabascans. South Naknek is a traditional Sugpiaq village. Federally recognized tribes are located in King Salmon and South Naknek.

9770.2.2 – Lake and Peninsula Borough

## **LAKE AND PENINSULA BOROUGH**

**Population:** 1,710 (2011 DCCED Certified Estimate)

**Incorporation Type:** Borough

**Communities in Borough:**

- Port Alsworth
- Nondalton
- Pedro Bay
- Iliamna
- Newhalen
- Kokhanok
- Igiugig
- Levelock
- Egegik
- Pilot Point
- Ugashik
- Port Heiden
- Chignik
- Chignik Lagoon
- Chignik Lake
- Perryville
- Ivanof Bay

### **Location and Climate**

The Lake & Peninsula Borough is located on the Alaska Peninsula, southwest of Anchorage. It is comprised of 17 communities, including 6 incorporated cities. It is bordered on the west by Bristol Bay and on the east by the Gulf of Alaska. It lies at approximately 60 North Latitude and 155 West Longitude. Lake and Peninsula Borough is located in the Kvichak, Aleutian Islands Recording District.

The borough Extends 400 miles from Lake Clark in the north to Ivanof Bay in the south, it contains three National Parks (Lake Clark Nat'l Park & Preserve, Katmai Nat'l Park & Preserve, and Aniakchak Nat'l Monument & Preserve); two National Wildlife Refuges (Becharof Nat'l Wildlife Refuge and Alaska Peninsula Nat'l Wildlife Refuge); and numerous designated Wild and Scenic Rivers and State Critical Habitat Areas.

The Lake and Peninsula Borough is geographically and ecologically diverse. It is bordered on the west by Bristol Bay and on the east by the Pacific Ocean. The Bristol Bay coast is comprised of low lying wetlands and the rugged Pacific coast is dominated by numerous volcanoes of the Aleutian Range, which runs the length of the Borough from Lake Clark to Ivanof Bay. Iliamna Lake, located in the north, is the largest fresh water lake in Alaska and the second largest in the United States. Iliamna Lake is home to one of only two colonies of freshwater seals in the world. These lakes provide nurseries to the largest red salmon runs in the world.

The area experiences a transitional climate. Average summer temperatures range from 42 to 62 degrees fahrenheit; winter temperatures range from 6 to 30 degrees fahrenheit. Annual precipitation is 24 inches, with 50 inches of snow. (*Information from the borough website*)

### **Transportation**

**Accessibility:** Road: There are two regional roads located in the borough: the Iliamna - Newhalen Road and the Williamsport - Pile Bay Road. The Iliamna-Newhalen Road connects the two communities. The Williamsport - Pile Bay Road provides access from the Pacific side of the borough to the Iliamna Lake communities (via vessel traffic on Lake Iliamna). Air: Scheduled air service provides transportation of passengers to the region's hubs in Iliamna and King Salmon from Anchorage. Air taxi and charter service transport passengers from the hubs to local communities.

**Airport Facilities:** Regional hub at King Salmon

**Airline Services:** All communities are served by local airports/runways. Alaska Airlines serves King Salmon.

**Freight:** Heavy cargo and durable goods are transported to borough communities by ship, barge, or ferry. Chignik is the only community served by the Alaska Marine Highway System, which calls on the community about six times per year, beginning in April and ending in October. Barge services are available via the Kvichak River to Lake Iliamna.

**Vessel Support:**

### **Economy**

Commercial fishing and fish processing are the most significant sectors of the economy within the Borough, which contains three of the State's most important salmon fishing districts: Egegik and Ugashik on Bristol Bay, and Chignik on the Pacific coast. The majority of Borough residents rely upon commercial fishing as a primary source of cash income. Seven shore-based processors and numerous floating processors operate within Borough boundaries, generally importing their workforce.

Tourism and recreational activities are the second most important industries in the Borough, and are rapidly increasing in economic importance. The Borough contains over 60 hunting and fishing lodges. Approximately 100 professional guides are registered to operate within Borough boundaries.

### **History, Culture & Demographics**

The majority of the borough's year-round residents are Aleuts, with a mixture of Eskimos and Athabascans. During the peak commercial fishing season, the borough population increases sharply.

The Lake and Peninsula Borough region has been inhabited almost continuously for the past 9,000 years. The area is rich in cultural resources and diversity. Yup'ik Eskimos, Aleuts, Athabascan Indians, and Inupiaq people have jointly occupied the area for the past 6,000 years. Russian explorers came to the region during the late 1700's. The late 1800's brought the first influx of non-native fishermen and cannery operations. A flu epidemic in 1918 was tragic to the Native population. Reindeer were introduced to assist the survivors, but the experiment eventually failed. In the 1930's, additional disease epidemics further decimated villages. After the Japanese attack on Dutch Harbor during World War II, numerous military facilities were constructed on the Alaska Peninsula including Fort Marrow at Port Heiden.

9770.2.3 – Aleknagik

**ALEKNAGIK** - (Pronunciation: uh-LECK-nuh-gik)

**Population:** 227 (2011 DCCED Certified Estimate, June 15, 2012)

**Incorporation Type:** 2<sup>nd</sup> Class City

**Borough Located In:** Unorganized

**Regional Native Corp:** Bristol Bay Native Corporation

### **Emergency Services**

**Police/VPSO:** 842-2189

**State Troopers:** Dillingham (842-5641)

**Fire:** City of Aleknagik VFD (842-2189);

**EMS/ Medical:** Aleknagik First Responders Group (842-2085)

**Clinic:** Aleknagik North Shore Health Clinic, and Aleknagik South Shore Health Clinic 842-2185

#### Location and Climate

Aleknagik is located at the head of Wood River on the southeast end of Lake Aleknagik, 16 miles northwest of Dillingham. Aleknagik is located in the Bristol Bay Recording District. The community is located on both the north and south shore of the Wood River. The south shore is connected by year-round road to Dillingham, 25 miles to the south.

59.273 North Latitude and -158.617 West Longitude.

Sec. 31, T010S, R055W, Seward Meridian

Aleknagik is in a transitional climate zone. The primary influence is maritime, although a continental climate does affect the weather here. Average summer temperatures range from 30 to 66 °F. Average winter temperatures range from 4 to 30 °F. Average annual precipitation is 20 to 35 inches, and average annual snowfall is 93 inches. Fog and low clouds are common during July and August and may preclude access. The lake and river are ice-free from June through mid-November.

#### Transportation

The north shore of the lake is not road accessible; residents use skiffs to travel to town on the south shore. Vehicles, skiffs, ATVs, and snowmachines are the most frequent means of local transportation.

**Accessibility:** Air service from Dillingham. Aleknagik is the only regional village with a road link to Dillingham. The road link a 25-mile road that connects the south shore.

**Airport Facilities:** There are 4 runways in Aleknagik. One airport is a state-owned 2,040' long by 80' wide gravel airstrip located on the north shore, and regular flights are scheduled through Dillingham. Moody's Aleknagik Seaplane Base, also on the north shore, accommodates float planes. The two additional airstrips are private runways; one is a 1,200' by 25' gravel dirt runway, located 2 miles southeast of Aleknagik, and the other is a 1,150' by 35' gravel runway.

**Airline Services:** Scheduled or charter air service from Grant Aviation

**Freight:** Barge (sporadic service) or airplane.

**Vessel Support:** Barge services are sporadic. A breakwater and boat launch are available, but the existing dock is a temporary structure.

## **Facilities & Utilities**

### **Communications:**

*In-State Phone:* Nushagak Telephone Co-op, Inc.

**Electricity:** Nushagak Electric Cooperative

**Fuel Availability:** Barge/ sporadic

**Fuel Storage - Tank Owners (Capacity):**

- Moody's Marina & Sea Lighterage (44,700 gals.)
- City (10,300)
- Mission Lodge (18,000)
- Aleknagik North Shore School (20,000 gals)

**Housing:** Aleknagik B&B; Jenny Lane Miracle Ridge B&B

### **Services:**

**Water & Sewage:** Water sources in Aleknagik include individual wells, a community well source at the school from which residents can haul water, and surface water. Water is filtered and chlorinated. There is no piped water system in Aleknagik. The majority of residents (49 homes) have household plumbing, and most use individual wells. Aleknagik has primarily individual septic tanks, a community septic tank, sewage pumper, sewage lagoon, and outhouses. There is no piped sewer system on the south shore of Lake Aleknagik.

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy:**

Many residents participate in commercial and subsistence activities on the Bristol Bay coast during the summer. In 2010, 22 residents held commercial fishing permits. Trapping is also an important means of income. Most families depend to some extent on subsistence activities to supplement their livelihoods. Salmon, freshwater fish, moose, caribou, and berries are harvested.

### **Culture & Demographics:**

A federally-recognized tribe is located in the community -- the Native Village of Aleknagik. It is a traditional Yup'ik Eskimo area, with historical influences from the Seventh-Day Adventists, Russian Orthodox, and Moravians. Fishing and subsistence activities are practiced.

#### Location and Climate

The City of Chignik is located on Anchorage Bay on the south shore of the Alaska Peninsula. It lies 450 miles southwest of Anchorage and 260 miles southwest of Kodiak. The community lies at approximately 56.295280° North Latitude and -158.402220° West Longitude. (Sec. 07, T045S, R058W, Seward Meridian.) Chignik is located in the Aleutian Islands Recording District. The area encompasses 11.7 sq. miles of land and 4.2 sq. miles of water. Chignik has a maritime climate characterized by cool summers and warm, rainy winters. Cloud cover and heavy winds are prevalent during winter months. Summer temperatures range from 39 to 60 °F. Winter temperatures average 20 °F. Annual precipitation averages 127 inches, with an average snowfall of 58 inches.

### Transportation

ATVs and skiffs are the primary means of local transportation.

**Accessibility:** Air service from King Salmon and Port Heiden, or boat.

**Airport Facilities:** state-owned 2,600' long by 60' wide gravel runway and a seaplane base.

**Airline Services:** Regular flights run from King Salmon and Port Heiden.

**Freight:** The state ferry operates bi-monthly from Kodiak between May and October. A 600' privately-owned dock and boat haul-out are available. A breakwater, 110-slip small boat harbor, and public dock are under development.

**Vessel Support:** The state ferry operates bi-monthly from Kodiak between May and October. A breakwater, 110-slip small boat harbor, and public dock are under development.

### **Economy**

As is typical of villages in the region, commercial fishing and subsistence activities are the mainstays of the economy. In 2009, 9 residents held commercial fishing permits. Two fish processing plants operate in Chignik: Norquest Adak and Trident Seafoods. Salmon, herring roe, halibut, cod, and crab are processed here; between 600 and 800 people come to Chignik to fish or work in the plants each summer. Residents depend on subsistence foods, including salmon, trout, crab, clams, caribou, and moose.

### **History, Culture & Demographics**

A village called "Kalwak" was originally located here; it was destroyed during the Russian fur boom in the late 1700s. Chignik, meaning "big wind," was established in the late 1800s as a fishing village and cannery. A four-masted sailing ship called the "Star of Alaska" transported workers and supplies between Chignik and San Francisco. Chinese crews from San Francisco traveled to Chignik in early spring to make tin cans for the cannery. Japanese workers followed in mid-June to begin processing. A post office was established in 1901. Coal mining occurred from 1899 to 1915. Chignik became an incorporated city in 1983. Today, two of the historical canneries are still in operation. The community is presently a mixture of non-Natives and Alutiiq. Subsistence on fish and caribou is important to residents' livelihoods.

9770.2.5 – Chignik Lagoon

**CHIGNIK LAGOON** - (Pronunciation: CHIG-nick)

**Population:** 77 (2011 AK Dept of Labor estimate)

**Incorporation Type:** Unincorporated

**Borough Located In:** Lake & Peninsula Borough

**Regional Native Corp:** Bristol Bay Native Corporation

### **Emergency Services**

**Police/VPSO:** None

**State Troopers:** 246-3464 (King Salmon)

**Fire:** Chignik Lagoon First Responder Group, 840-2248  
Chignik Lagoon Rescue Squad, 840-2218  
**Medical:** Chignik Lagoon Clinic, 842-5201

### Organizations with Local Offices

**School District:** Lake and Peninsula Borough School District  
Phone: 246-4280  
Fax: 246-4473

### Location and Climate

Chignik Lagoon is located on the south shore of the Alaska Peninsula, 450 miles southwest of Anchorage. It lies 180 air miles south of King Salmon, 8.5 miles west of Chignik, and 16 miles east of Chignik Lake. The community lies at approximately 56.309950° North Latitude and - 158.531420° West Longitude. (Sec. 23, T044S, R059W, Seward Meridian.) Chignik Lagoon is located in the Aleutian Islands Recording District.

The community experiences a maritime climate, characterized by cool summers and relatively warm, wet winters. Thick cloud cover and heavy winds are prevalent during winter months. Summer temperatures range from 39 to 60 °F. Winter temperatures range from 21 to 36 °F. Precipitation averages 127 inches annually, with an average annual snowfall of 58 inches.

### Transportation

ATVs and skiffs are the primary means of local transportation.

**Accessibility:** Air service from King Salmon, or boat.

**Airport Facilities:** State-maintained 1,810' by 60' wide gravel airstrip and a seaplane base

**Airline Services:** Regular and charter flights are available from King Salmon.

**Freight:** A cargo ship brings supplies annually.

**Vessel Support:** A cargo ship brings supplies annually, and goods are lightered to shore. Boat haul-outs are available.

**Housing:** None.

**Services:** Car rentals available.

**Water & Sewage:** Most homes have water service from a surface source. Households without water service have individual wells. No homes have sewer service. Sewage disposal is done by individual septic tanks.

### **Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

## **Economy**

Fishing is the mainstay of the economy in Chignik Lagoon, and the area serves as a regional fishing center. The economy is dependent on the success of the salmon fleet. In 2010, 22 residents held commercial fishing permits. The primary year-round employers are the village council, electric plant, and school. Subsistence activities contribute to food sources. Salmon, other fish, crab, clams, caribou, moose, ducks, and berries are utilized.

## **History, Culture & Demographics**

Chignik Lagoon experiences an influx of fishermen during the summer months. The population swells by 200 during the fishing season.

Chignik Lagoon took its name from its location and proximity to Chignik ("big wind"). The people of this area have always been sea-dependent, living on otter, sea lion, porpoise, and whale. During the Russian fur boom from 1767 to 1783, the sea otter population was decimated. This,

in addition to disease and warfare, reduced the Native population to less than half its former size. It has developed as a fishing village.

9770.2.6 – Chignik Lake

**CHIGNIK LAKE** - (Pronunciation: CHIG-nick)

**Population:** 69 (2011AK Dept of Labor Estimate)

**Incorporation Type:** Unincorporated

**Environmental Staff (IGAP):** 845-2888

**Location and Climate**

Chignik Lake is located on the south side of the Alaska Peninsula next to the body of water of the same name. It lies 13 miles from Chignik, 265 miles southwest of Kodiak, and 474 miles southwest of Anchorage. The community lies at approximately 56.255370° North Latitude and -

158.761750° West Longitude. (Sec. 25, T045S, R061W, Seward Meridian.) Chignik Lake is located in the Aleutian Islands Recording District.

The maritime climate of Chignik Lake is characterized by cool summers and relatively warm, rainy winters. Summer temperatures range from 39 to 60 °F. Winter temperatures range from 21 to 50 °F. Extreme temperatures, ranging from a low of -12 to a high of 76 °F, have been recorded. Precipitation averages 127 inches annually, with an average annual snowfall of 58 inches.

### **Transportation**

Skiffs and ATVs are the primary means of local transportation.

**Accessibility:** Regularly-scheduled and charter flights. The state ferry provides service to Chignik Lagoon four times per year.

**Airport Facilities:** State-owned 2,800' long by 60' wide gravel airstrip; seaplanes may land at Chignik Lagoon.

**Airline Services:** Regularly-scheduled and charter.

**Freight:** Goods are lightered, weekly during the summer and monthly during winter, to the lake via Chignik Lagoon and are then transported over land.

**Vessel Support:** There is no harbor, dock, barge access, or boat haul-outs.

### **Facilities & Utilities**

**Sensitive Areas to Protect in the Event of a Spill:** Chignik Lake and Chignik River (salmon spawning areas).

### **Economy**

Fishing is the mainstay of Chignik Lake's economy. Some residents leave the community during summer months to commercial fish, crew, or work at the fish processors at Chignik. In 2009, six residents held commercial fishing permits. The people depend on subsistence hunting and fishing and utilize salmon, other fish, caribou, moose, and seal.

The 2006-2010 American Community Survey (ACS) estimated 32 residents as employed. The local unemployment rate was 13.5%. The percentage of workers not in labor force was 38.3%.

### **History, Culture & Demographics**

The present population traces its roots from the Alutiiq near Illnik and the old village of Kanatag near Becharof Lake. The community was the winter residence of a single family in 1903. Other families moved from surrounding communities in the early 1950s when a school was built.

A federally-recognized tribe is located in the community -- the Chignik Lake Village. The population of the community consists of 87.6% Alaska Native or part Native. Chignik Lake is a predominantly Alutiiq fishing village.

**Location and Climate**

Clark's Point is located on a spit on the northeastern shore of Nushagak Bay, 15 miles from Dillingham and 337 miles southwest of Anchorage. The community lies at approximately 58.844170° North Latitude and -158.550830° West Longitude. (Sec. 25, T015S, R056W, Seward Meridian.) Clark's Point is located in the Bristol Bay Recording District. The area encompasses 3.1 sq. miles of land and 0.9 sq. miles of water.

Clark's Point is located in a climatic transition zone. The primary climatic influence is maritime, although the arctic climate also affects the region. Average summer temperatures range from 37 to 66 °F. Average winter temperatures range from 4 to 30 °F. Average annual precipitation is 20 to 26 inches, and annual snowfall averages 82 inches. Fog and low clouds are common during winter months. The Nushagak Bay is ice-free from June through mid-November.

**Transportation**

ATVs and snowmachines are the primary means of local transportation.

**Accessibility:** Air service from Dillingham, or float plane.

**Airport Facilities:** state-owned 3,200' long by 60' wide gravel runway. Float planes land on Nushagak River.

**Airline Services:** Regular and charter flights are available from Dillingham.

**Freight:** Freight is brought by barge to Dillingham and then flown or lightered to the community.  
**Vessel Support:** The only boat moorage is an undeveloped spit dock owned by the city; boats land on the beach. Trident Seafoods owns a private dock for fish processing.

### **Facilities & Utilities**

#### **Communications:**

*In-State Phone:* Nushagak Telephone Co-op, Inc.  
*Long-Distance Phone:* GCI; Nushagak Telephone  
*Internet Service Provider:* GCI ([www.gci.net](http://www.gci.net))  
*Cable Provider:* None  
*TV Stations:* ARCS  
*Radio Stations:* KAKN-FM; KDLG-AM  
*Teleconferencing:* Alaska Teleconferencing Network

**Electricity:** Clark's Point Electric Utility 236-1221

**Fuel Availability:** Diesel

**Fuel Storage - Tank Owners (Capacity):**

- Trident Seafoods (76,600 gals.)
- Southwest Region Schools (9,900)
- City (56,200 gals.)
- City Power Plant (10,200)

**Housing:** None.

#### **Services:**

**Water & Sewage:** 80% of residents have water service from a spring fed well; the remainder use individual wells. 40% of homes and the school have sewer service. The other households use septic tanks or pit privies for sewage treatment.

#### **Miscellaneous:**

#### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

#### **Economy**

The economic base in Clark's Point is primarily commercial fishing. Trident Seafoods operates an on-shore facility. In 2009, 11 residents held commercial fishing permits. Everyone depends on subsistence to some extent and travels over a great area, if necessary. Salmon, smelt, moose, bear, rabbit, ptarmigan, duck, and geese are utilized. Exchange relationships exist between nearby communities; for example, whitefish from Ekwok, New Stuyahok, and Bethel are traded for smelt, and ling cod from Manokotak are traded for moose.

#### **History, Culture & Demographics**

The community was founded on fishing operations of non-Native settlers, although presently it is predominantly Yup'ik Eskimo. The population increases by about 300 in summer months due to the commercial fishery.

The point originally had an Eskimo name, "Saguyak," yet there is no evidence of a settlement at the site prior to the Nushagak Packing Company cannery, established in 1888. The community was named for John Clark, who was the manager of the Alaska Commercial Company store at Nushagak. Clark is reputed to have operated a saltery prior to the establishment of the cannery. In 1893 the cannery became a member of the Alaska Packers Association. In 1901 a two-line cannery was built. During World War II, the canning operation ceased, and only salting was done at Clark's Point. The plant was shut down permanently by 1952, and the Alaska Packers Association used the facility as the headquarters for its fishing fleet. In 1929, a major flood occurred. The city was incorporated in 1971. The village has been plagued by severe erosion. A housing project in 1982 was constructed on high and safe ground on the bluff. A federally-recognized tribe is located in the community. The population of the community consists of 92% Alaska Native or part Native. The community was founded on fishing operations of non-Native settlers, although presently it is predominantly Yup'ik Eskimo. The population increases by about 300 in summer months due to the commercial fishery.

### **Location and Climate**

Dillingham is located at the extreme northern end of Nushagak Bay in northern Bristol Bay, at the confluence of the Wood and Nushagak Rivers. It lies 327 miles southwest of Anchorage and is a 6 hour flight from Seattle. The community lies at approximately 59.039720° North Latitude and -158.457500° West Longitude. (Sec. 21, T013S, R055W, Seward Meridian.) Dillingham is located in the Bristol Bay Recording District. The area encompasses 33.6 sq. miles of land and 2.1 sq. miles of water. The primary climatic influence is maritime; however, the arctic climate of the Interior also affects the Bristol Bay coast. Average summer temperatures range from 37 to 66 °F. Average winter temperatures range from 4 to 30 °F. Annual precipitation averages 26 inches, and annual snowfall averages 65 inches. Heavy fog is common in July and August. Winds of up to 60-70 mph may occur between December and March. The Nushagak River is ice-free from June through November.

### **Transportation**

**Accessibility:** Air service from Anchorage, or boat. There is a 23-mile DOT-maintained gravel road to Aleknagik; it was first constructed in 1960.

**Airport Facilities:** state-owned airport provides a 6,400' long by 150' wide paved runway and regular jet flights are available from Anchorage. A seaplane base is available 3 miles west at Shannon's Pond; it is owned by the U.S. Bureau of Land Management, Division of Lands. A heliport is available at Kanakanak Hospital.

**Airline Services:** regular jet flights are available from Anchorage.

**Freight:** Barge (sporadic service) or airplane.

**Vessel Support:** There is a city-operated small boat harbor with 320 slips, a dock, barge landing, boat launch, and boat haul-out facilities. It is a tidal harbor and only for seasonal use. Two barge lines make scheduled trips from Seattle.

*Internet Service Provider:* GCI ([www.gci.net](http://www.gci.net)); Nushagak Telephone Cooperative, Inc. ([www.nushtel.com](http://www.nushtel.com))

*Cable Provider:* Nushagak Telephone Cooperative, Inc.

*TV Stations:* ARCS; KUAC; KYAC      *Radio Stations:* KDLG-AM; KRUP-FM; KAKN-FM

*Teleconferencing:* Alaska Teleconferencing Network; Legislative Information Office

**Electricity:** Nushagak Electric Cooperative

**Fuel Availability:** Diesel

**Fuel Storage - Tank Owners** (Capacity):

- Delta Western Fuel
- Peter Pan Seafoods (44,000 gals.)
- Nushagak Electric (1,850,000 gals.)
- Bristol Fuels

**Housing:** Bristol Inn (842-2240 [www.alaskaoutdoors.com/bristolinn](http://www.alaskaoutdoors.com/bristolinn) - 30 guest rooms); Beaver Creek B&B (842-5366 [www.alaskaone.com/beaverck](http://www.alaskaone.com/beaverck)); Bristol Bay Lodge (842-2500); Coho B&B (842-2335); Aleknagik Schoolhouse Inn (842-1630).

**Services:** D&J Car Rentals; Nushagak Cab; Gira's Taxi and; Beaver Creek B&B Car Rentals

**Water & Sewage:** 40% of homes are served by the city's piped water system from three deep wells; the remaining 60% use individual wells. 25% of homes, those in the core townsite, have sewer service. The remaining 75% of homes have individual septic systems.

**Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

**Local Spill Response Equipment:** ADEC has an equipment conex and a Community Spill Response Agreement with the community of Dillingham. In addition, Chadux maintains spill response equipment in Dillingham.

### **Economy**

Dillingham is the economic, transportation, and public service center for western Bristol Bay. Commercial fishing, fish processing, cold storage, and support of the fishing industry are the primary activities. Icicle and Peter Pan operate fish processing plants in Dillingham. In 2009, 227 residents held commercial fishing permits. During spring and summer, the population doubles. The city's role as the regional center for government and services helps to stabilize seasonal employment. Many residents depend on subsistence activities, and trapping beaver, otter, mink, lynx, and fox provides cash income. Salmon, grayling, pike, moose, bear, caribou, and berries are harvested.

### **History, Culture & Demographics**

The area around Dillingham was inhabited by both Eskimos and Athabascans and became a trade center when Russians erected the Alexandrovski Redoubt Post in 1818. Local Native groups and Natives from the Kuskokwim Region, the Alaska Peninsula, and Cook Inlet mixed together as they came to visit or live at the post. The community was known as Nushagak by 1837, when a Russian Orthodox mission was established. In 1881 the U.S. Signal Corps established a meteorological station at Nushagak. In 1884 the first salmon cannery in the Bristol Bay region was constructed by Arctic Packing Co., east of the site of modern-day Dillingham. Ten more were established within the next seventeen years. The post office at Snag Point and town were named after U.S. Senator Paul Dillingham in 1904, who had toured Alaska extensively with his Senate subcommittee during 1903. The 1918-19 influenza epidemic struck the region, and left no more than 500 survivors. A hospital and orphanage were established in Kanakanak after the epidemic, 6 miles from the present-day city center. The Dillingham townsite was first surveyed in 1947. The city was incorporated in 1963.

A federally-recognized tribe is located in the community -- the Curyung Tribal Council. The population of the community consists of 60.9% Alaska Native or part Native. Traditionally a Yup'ik Eskimo area with Russian influences, Dillingham is now a highly mixed population of non-Natives and Natives. The outstanding commercial fishing opportunities in the Bristol Bay area are the focus of the local culture.

9770.2.9 – Ekuk

#### Location and Climate

Ekuk is located on the east coast of Nushagak Bay, 17 miles south of Dillingham. It is spread out for about 2 miles along a narrow gravel spit that extends from the Ekuk Bluffs in the shape of a

hook. The community lies at approximately 58.814986° North Latitude and -158.557684° West Longitude. (Sec. 12, T016S, R056W, Seward Meridian.) Ekuk is located in the Bristol Bay Recording District. Ekuk is in a climatic transition zone. The primary climatic influence is maritime, although the arctic climate also affects the region. Average summer temperatures range from 37 to 66 °F; winter temperatures range from 4 to 30 °F. Annual precipitation averages 20 to 26 inches. Fog and high winds are common during winter months. The Bay is ice-free from June through mid-November.

### **Transportation**

Clark's Point, two miles north, can be reached by snow machine during winter.

**Accessibility:** Air service from Dillingham, or boat.

**Airport Facilities:** Ekuk Village Council owns a 1,200' long by 40' wide dirt/gravel airstrip.

**Airline Services:** Scheduled and charter flights are available from Dillingham during the summer months.

**Freight:** Boat.

**Vessel Support:** The village has a small dock on the south side. Other private docks are in use.

**Fuel Storage - Tank Owners (Capacity):** Columbia Ward Fisheries (190,600 gals.)

**Housing:** None.

**Services:**

**Water & Sewage:** No water or sewer service. Ward's Cannery has it's own water and sewer system to serve it's plant. One resident has a well.

**Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

The Wards Cove Packing Company closed in 2002. During its peak, it employed 200 workers each summer, providing a market for about 80 commercial fishing boats and over 160 beach set net sites.

### **History, Culture & Demographics**

The word Ekuk means "the last village down," reflecting that Ekuk is the farthest village south on the Nushagak Bay. The village is mentioned in Russian accounts of 1824 and 1828 as Village

Ekuk and Seleniye Ikuk. It is thought that Ekuk was a major Eskimo village at one time. Russians employed Natives as guides for their boats as they navigated up Nushagak Bay to the trading post at Aleksandrovsk after 1818. Before the North Alaska Salmon Company opened a cannery at Ekuk in 1903, many residents had moved to the Moravian Mission at Carmel. In addition, numerous canneries sprang up during 1888 and 1889 on the east and west sides of the bay, which drew many residents away from the village. Ekuk had a school from 1958 to 1974. Today, the cannery watchman's family is the only year-round residents. In the summer, the village comes alive with cannery crews, commercial fishing, and subsistence activities. A federally-recognized tribe is located in the community -- the Native Village of Ekuk. The population of the community consists of 0% Alaska Native or part Native. Historically a Yup'ik Eskimo village, Ekuk is now used only as a summer commercial cannery and subsistence-use site. Many families have set net sites in Ekuk.

9770.2.10 - Ekwok

**EKWOK** - (Pronunciation: ECK-wock)

#### Location and Climate

Ekwok is located along the Nushagak River, 43 miles northeast of Dillingham and 285 miles southwest of Anchorage.

59.349 North Latitude and -157.475 West Longitude

Sec. 35, T009S, R049W, Seward Meridian

Ekwok is in a climatic transition zone. The primary influence is maritime, although a continental climate also affects the weather. Average summer temperatures range from 30 to 66 °F; winter temperatures average from 4 to 30 °F. Precipitation averages 20 to 35 inches each year. Extremely strong winds are common during winter months. Fog is prevalent during summer months. The river is ice-free from June through mid-November.

**Transportation**

No outside road access. Skiffs, ATVs, and snow machines are used for local transportation to other villages.

**Accessibility:** Air service from Dillingham, or boat.

**Airport Facilities:** State-owned 3,300' long by 75' wide gravel runway. Float planes land on the Nushagak River.

**Airline Services:** Scheduled and charter flights available. Grant Aviation (daily scheduled flights may not be available)

**Freight:** Coastal Marine Transport barge from Dillingham (during ice-free months, June-November)

**Vessel Support:** There are no docking facilities, but a barge off-loading area exists.

**Facilities & Utilities**

**Electricity:** City of Ekwok

**Fuel Availability:** diesel

**Fuel Storage - Tank Owners (Capacity):**

- Southwest Region Schools (45,990 gals.)
- Ekwok Natives Ltd. (29,330)
- Alaska Power Systems (60,000)

**Lodging & Accommodations:** Ekwok Lodge and Maalug's Lodge.

**Services:**

**Water & Sewage:** No water service. Most homes have individual wells. Sewer service is available and serves 16 houses. The remaining house use septic systems or a flush/haul system. A washeteria is not available.

**Miscellaneous:** General Store: Uncle Freddie's General Store (464-3733)

**Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

**Economy:**

A few residents trap. The entire population depends on subsistence activities for various food sources. Salmon, pike, moose, caribou, duck, and berries are harvested. Summer gardens are also popular, because families do not leave the village to fish for subsistence purposes. Most residents are not interested in participating in a cash economy. In 2010, 3 residents held commercial fishing permits in Ekwok. The village corporation owns a fishing lodge two miles downriver. Gravel is mined near the community.

**Culture & Demographics:**

Ekwok means "end of the bluff" and is the oldest continuously-occupied Yup'ik Eskimo village on the river. Many of the earliest homes in Ekwok were located in a low flat area near the riverbank. After a severe flood in the early 1960s, villagers relocated to the current location on higher ground.

A federally-recognized tribe is located in the community -- the Ekwok Village. Ekwok is a Yup'ik Eskimo village with a fishing and subsistence lifestyle (90% of the population is Alaska Native).

**Fuel Storage - Tank Owners** (Capacity):

- Village Council (63,900 gals.)
- Lake & Peninsula Schools (5,000)

**Lodging & Accommodations:**

- Alaska's Clearwater Lodge at Bristol Bay (733-7743)
- Kvichak Cabin (533-3227)
- Igiugig Boarding House (533-3200)

**Services:** A washeteria is available in the community.

**Water & Sewage:** Water and sewer service are connect to 12 homes with 2 additional homes only being connected to the sewer service. The water is from the Kvichak River.

**Miscellaneous:** Sayak's Lavguq (General/Grocery Store ; 533-3219)

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

As is typical for the region, salmon fishing is the mainstay of Igiugig's economy. In 2009, four residents held commercial fishing permits. Many travel to Naknek each summer to fish or work in the canneries. Subsistence is an important part of the residents' lifestyle. Salmon, trout, whitefish, moose, caribou, and rabbit are utilized. Some trapping occurs. Lake Iliamna is the eighth largest lake in the U.S. and the largest lake in Alaska. Trophy rainbow trout attract sport fishermen. There are seven commercial lodges that serve sports fishermen and hunters seasonally in Igiugig.

### **History, Culture & Demographics**

Kiatagmuit Eskimos originally lived on the north bank of the Kvichak River in the village of Kaskanak and used Igiugig as a summer fish camp. At the turn of the century, these people moved upriver to the present site of Igiugig. People from Branch also moved to Igiugig as it began to develop. Today, about one-third of residents can trace their roots back to the Branch River village. A post office was established in 1934 but was discontinued in 1954. Commercial and subsistence fishing sustain the community.

A federally-recognized tribe is located in the community -- the Igiugig Village Council. The population of the community consists of 83% Alaska Native or part Native. Historically an Eskimo village, the population is now primarily Alutiiq and depends upon commercial fishing and a subsistence lifestyle. During the 2000 U.S. Census, total housing units numbered 20, and vacant housing units numbered 4. Vacant housing units used only seasonally numbered 4.

9770.2.12 - Iliamna

**ILIAMNA** - (Pronunciation: ill-ee-AM-nuh; a.k.a. Nilavena)

**Population:** 110 (2011 Alaska Dept of Labor estimate )

**Incorporation Type:** Unincorporated

**Borough Located In:** Lake & Peninsula Borough

**Location and Climate:**

Iliamna is located on the northwest side of Iliamna Lake, 225 miles southwest of Anchorage. It is near the Lake Clark Park and Preserve. It lies at approximately 59.754720 North Latitude and - 154.906110 West Longitude. (Sec. 12, T005S, R033W, Seward Meridian.) Iliamna is located in the Iliamna Recording District.

Iliamna lies in the transitional climatic zone with strong maritime influences. Average summer temperatures range from 42 to 62 °F; winter temperatures average 6 to 30 °F. Annual precipitation averages 26 inches, with 64 inches of snowfall.

| Roadhouse Creek                                                                                            |                                | Drains into Lake Iliamna |

### **Economy:**

Commercial fishing, sport fishing, and tourism are the major sources of income for the community. In 2011, 12 residents held commercial fishing permits. Many workers depart each summer to fish in Bristol Bay. Lake Iliamna is the eighth largest lake in the U.S., and tourism is increasing. However, most lodge employees are not local workers. Most residents participate in subsistence hunting and fishing activities. Salmon, trout, grayling, moose, caribou, bear, seal, porcupine, and rabbits are utilized. Northern Dynasty Minerals Ltd. is exploring the gold, copper, and molybdenum potential of Pebble Mine, 15 miles from Iliamna, but development of the mine remains controversial, due to environmental concerns.

### **Culture and Demographics:**

In recent years, Iliamna has become a recreational and tourist attraction due to the excellent fishing at Iliamna Lake. The population is mixed, with non-Natives, Tanaina Athabascans, and Alutiiq and Yup'ik Eskimos. The sale of alcohol is prohibited in the community; importation or possession are allowed.

Prior to 1935, "Old Iliamna" was located near the mouth of the Iliamna River, a traditional Athabaskan village. A post office was established there in 1901. Around 1935, villagers moved to the present location, approximately 40 miles from the old site. The post office followed.

Iliamna's current size and character can be attributed to the development of fishing and hunting

lodges. The first lodge opened in the 1930s. A second lodge was built in the 1950s. During the 1970s and 80s, lots were made available by the Baptist church, and additional lodges were constructed.

9770.2.13 – Ivanof Bay

#### Location and Climate

Ivanof Bay is located on the northeast end of the Kupreanof Peninsula, 500 miles southwest of Anchorage and 250 miles southeast of Dillingham. The community lies at approximately 55.911230° North Latitude and -159.486120° West Longitude. (Sec. 33, T049S, R066W, Seward Meridian.) Ivanof Bay is located in the Aleutian Islands Recording District. Ivanof Bay has a maritime climate characterized by cool summers, warm winters, and rainy weather. Average summer temperatures range from 39 to 60 °F; winter temperatures range from 21 to 50 °F. Precipitation averages 125 inches per year, with 58 inches of snow.

### **Transportation**

ATVs and skiffs are the primary modes of local transportation.

**Accessibility:** Air service from King Salmon, or boat. Flights from King Salmon average one per week in the winter and two per week in the summer, weather permitting.

**Airport Facilities:** Bay View, Inc., owns a private 1,500' gravel airstrip. Ivanof Bay is accessible by float plane.

**Airline Services:** Flights from King Salmon average one per week in the winter and two per week in the summer, weather permitting.

**Freight:** Barge or airplane.

**Vessel Support:** There is no public dock or harbor. ATVs and skiffs are the primary modes of local transportation.

**Housing:** None.

#### **Services:**

**Water & Sewage:** All facilities and homes are connected to the community water system supplied by a well and surface water. Individual septic tanks are used for sewage treatment.

#### **Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

Many residents trap in the winter. The people depend upon subsistence hunting and fishing and use salmon, trout, crab, clams, moose, caribou, bear, porcupine, and seals.

### **History, Culture & Demographics**

The bay was named by Lt. Dall of the U.S. Coast and Geodetic Survey in 1880. A salmon cannery operated at this site from the 1930s to the early 1950s. A post office operated from 1952 to 1954. Several families moved from Perryville to Ivanof Bay in 1965 in search of better water sources and hunting grounds and to pursue a peaceful lifestyle with religious freedom. The school closed in the 2000-2001 year, due to insufficient enrollment.

A federally-recognized tribe is located in the community -- the Ivanof Bay Village. The population of the community consists of 95.5% Alaska Native or part Native. Ivanof Bay has traditional Alutiiq influences and practices a subsistence lifestyle. In summer, most residents leave the community to live and fish near Chignik.

9770.2.14 – King Salmon

#### Location and Climate

King Salmon is located on the north bank of the Naknek River on the Alaska Peninsula, about 15 miles upriver from Naknek. It is 284 miles southwest of Anchorage. The community lies at approximately 58.688330° North Latitude and -156.661390° West Longitude. (Sec. 23, T017S, R045W, Seward Meridian.) King Salmon is located in the Kvichak Recording District. The climate is mainly maritime, characterized by cool, humid, and windy weather. Average summer temperatures range from 42 to 63 °F; average winter temperatures range from 29 to 44 °F. Extremes from -46 to 88 °F have been recorded. Total precipitation averages 20 inches annually, with 45 inches of snowfall. Fog is common during summer months.

#### Transportation

Vehicles are the primary means of local transportation; skiffs are used during summer.

**Accessibility:** Air service from Anchorage, or boat.

**Airport Facilities:** State-owned airport has an 8,901' long by 150' wide paved, lighted runway and a 4,018' long by 100' wide asphalt/gravel crosswind runway. A 4,000' stretch of the Naknek

River is designated for float planes. A seaplane base is also located at Lake Brooks, within the Katmai National Park to the east

**Airline Services:** King Salmon is a transportation hub for Bristol Bay, There are scheduled jet flights and charter services to and from Anchorage.

**Freight:** Cargo goods are delivered to Naknek by barge and trucked upriver to King Salmon via a 15-mile connecting road. During winter, an ice road provides access to South Naknek..

**Vessel Support:** Four docks are available on the Naknek River -- owned by the U.S. Park Service, U.S. Fish & Wildlife, Alaska State Troopers, and the Bristol Bay Borough.

- No See Um Lodge
- Up the Creek B&B.

#### **Services:**

**Water & Sewage:** 80% of households have individual wells. The borough operates a piped sewage system that serves most residents with the remaining residents using individual septic tanks.

#### **Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

Government jobs, transportation, and fishing-related employment are the mainstays of the King Salmon economy. In 2009, 32 residents held commercial fishing permits. Air services employ a

large portion of the community, as King Salmon is a major air transportation point for Bristol Bay salmon. The Bristol Bay red salmon fishery is the largest in the world, although there have been relatively poor seasons, such as in the early 1970s, 1982, and 1997. Salmon prices have declined in recent years. King Salmon is also a departure point for the Katmai National Park and Preserve, which includes the McNeil River State Game Sanctuary, Brooks Camp, and the Valley of Ten Thousand Smokes. Fishing for all five species of salmon and rainbow trout are one of this area's top attractions. King Salmon Airport is the summer hub for wilderness and fishing adventures in the area. The Air Force base has been closed, although it is maintained under contract by Chugach Development Corporation.

### **Culture and Demographics**

The Native population is a mixture of Aleuts, Indians, and Eskimos. Although King Salmon was not included in the 1972 Alaska Native Claims Settlement Act (ANCSA), the King Salmon Tribe became a federally recognized entity as of December 29, 2000. There are 24 active Native allotment claims and 2 patented claims near King Salmon. Students attend school in Naknek, 15 miles away.

Present-day tribal members are descendants of a group that was forced to relocate to King Salmon due to the eruption of Mount Katmai, on the east coast of the peninsula. In the 1930s, an air navigation silo was built at King Salmon. At the beginning of World War II, the U.S. built an Air Force base. It was maintained by the Federal Aviation Administration throughout the war. In 1949, a post office was established, and the U.S. Army Corps of Engineers constructed a road to Naknek. Other government quarters, such as National Park Service, Fish & Game, and the weather bureau, were developed. The King Salmon Inn opened in 1956. The community has grown as a government, transportation, and service center for the commercial red salmon and recreational visitor industries. In 1993, the Air Force station went into a caretaker status. It is being maintained and operated under contract for the Air Force by the Chugach Development Corporation and supports daily military activities, including Air Force, Army, Marine, and North American Air Defense (NORAD) missions and US Coast Guard law enforcement and search and rescue missions. As well, the Bristol Bay Borough and the State of Alaska are using several buildings on the base.

A federally-recognized tribe is located in the community -- the King Salmon Tribe. The population of the community consists of 30% Alaska Native or part Native. The Native population is a mixture of Aleuts, Indians, and Eskimos. Although King Salmon was not included in the 1972 Alaska Native Claims Settlement Act (ANCSA), the King Salmon Tribe became a federally recognized entity as of December 29, 2000. There are 24 active Native allotment claims and 2 patented claims near King Salmon. Students attend school in Naknek, 15 miles away.

9770.2.15 - Kokhanok

**KOKHANOK** - (Pronunciation: KOCK-hone-ack)

**Population:** 179 (2011 Estimate)

**Incorporation Type:** Unincorporated

**Borough Located In:** Lake & Peninsula Borough

**Regional Native Corp:** Bristol Bay Native Corporation

#### Location and Climate

Kokhanok is located on the south shore of Iliamna Lake, 22 miles south of Iliamna and 88 miles northeast of King Salmon. The community lies at approximately 59.441600° North Latitude and -154.755140° West Longitude. (Sec. 32, T008S, R032W, Seward Meridian.) Kokhanok is located in the Iliamna Recording District.

59.442° North Latitude and -154.755° West Longitude

Sec. 32, T008S, R032W, Seward Meridian

Kokhanok lies in the transitional climatic zone. Average summer temperatures range from 40 to 64 °F; winter temperatures average 3 to 30 °F. The record high is 84 °F and the record low -47 °F. Precipitation averages 32 inches annually, with 89 inches of snowfall. Wind storms and ice fog are common during winter.

#### Transportation

Skiffs, ATVs, and trucks are common forms of local transportation.

**Accessibility:** Air service from Anchorage, Iliamna, and King Salmon, or boat.

**Airport Facilities:** State-owned 3,300 long by 75' wide gravel airstrip and a seaplane base

**Airline Services:** Scheduled and charter air services from Anchorage, Iliamna, and King Salmon. Iliamna Air Taxi (daily scheduled flights may not be available)

**Freight:** Supplies delivered by barge via the Kvichak River must be lightered to shore.

**Vessel Support:** There are no docking facilities.

#### Facilities & Utilities

##### **Communications:**

*In-State Phone:* ACS of the Northland

*Long-Distance Phone:* AT&T Alascom

*Internet Service Provider:* School Only - GCI ([www.gci.net](http://www.gci.net))

*Cable Provider:* None  
*TV Stations:* ARCS  
*Radio Stations:* KGTL-AM; KBBI-AM; KDLG-AM  
*Teleconferencing:* Alaska Teleconferencing Network

**Electricity:** Kokhanok Village generates power only during the summer months; in winter, electricity is purchased from the school district.

**Fuel Availability:** Diesel

**Fuel Storage - Tank Owners (Capacity):**

- Village Council (58,900 gals.)
- Roehl's Ent. (3,800)
- Lake & Peninsula Schools (3,600)

**Housing:** Lake Crest B&B (282-2262)

**Services:**

**Water & Sewage:** The village operates a piped water and sewer system that serves 35 households. The school operates its own well and water treatment facility.

**Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

**Economy:**

The school is the largest employer in Kokhanok. Commercial fishing has declined since several limited entry permits were sold. Some residents travel to the Bristol Bay area each summer to fish. In 2010, 9 persons held commercial fishing permits. People heavily rely on subsistence activities; many families have a summer fish camp near the Gibraltar River. Salmon, trout, grayling, moose, bear, rabbit, porcupine, and seal are utilized.

**Culture & Demographics:**

This fishing village was first listed in the U.S. Census in 1890 by A.B. Schanz. The community was relocated to higher ground a few years ago when the rising level of Iliamna Lake threatened several community buildings.

A federally-recognized tribe is located in the community -- the Kokhanok Village. The village has a mixed Native population, primarily Alutiiq and Yup'ik. Subsistence activities are the focal point of the culture and lifestyle. The sale of alcohol is banned in the village.

9770.2.16 - Koliganek

**KOLIGANEK** - (Pronunciation: koh-LIG-uh-neck)

- Village Council (20,000)
- Electric Utility (60,000)

**Lodging & Accomodations:** Bobby's B&B (596-3455)

#### **Services:**

**Water & Sewage:** Water and sewer service are connected to 33 homes. The water is from a central well and the sewage is treated at a community septic tank. 8 homes have individual wells and septic systems. 15 homes haul water and use honeybuckets.

#### **Miscellaneous:**

##### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

##### **Economy:**

The school and village organization provide most year-round employment. Many residents trap, and subsistence activities are an important part of the economy. Residents are employed in sales, clerical, management, professional, production, transportation, and service occupations. The town center contains the school, health clinic, two general stores, fuel storage, power generation building, and the village council building. The IGAP program operates a recycling center.

##### **Culture & Demographics:**

It is an Eskimo village first listed in the 1880 Census as "Kalignak." The name is local, recorded by the U.S. Geological Survey in 1930. Since that time, the village has moved four miles downstream from the original site.

A federally-recognized tribe is located in the community -- the New Koliganek Village Council. Koliganek is a Yup'ik Eskimo village with Russian Orthodox practices. Subsistence activities are an important part of the lifestyle.

**Services:** A washeteria is available.

**Water & Sewage:** No water or sewer service. Water is supplied from individual wells and sewage is treated in individual septic systems.

**Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

In 2009, seven residents held commercial fishing permits. Most travel to Naknek to fish or work in the canneries during the summer season. Several seasonal lodges operate in the area. The community relies upon subsistence activities for a large portion of its diet. Salmon, trout, moose, caribou, and berries are harvested.

### **History, Culture & Demographics**

Early Russian explorers reported the presence of Levelock, which they called "Kvichak." The smallpox epidemic of 1837 killed more than half of the residents of the Bristol Bay region and left entire villages abandoned. Kvichak was mentioned during the 1890 census, although the population was not measured. A measles epidemic hit the region in 1900. A 1908 survey of Russian missions identified "Lovelock's Mission" at this site. The worldwide influenza epidemic in 1918-19 again devastated area villages. Koggiung Packers operated a cannery at Levelock in 1925-26. A large fire, attributed to a cannery worker's careless cigarette, threatened the entire village in 1926, but residents dug fire lines that saved their homes. The fire depleted the scarce wood resources used to heat homes. A second cannery operated from 1928-29. In 1930 the first school was built, and a post office was established in 1939. By this time, families had converted their homes to oil heat. Moose first appeared in the area in the 1930s. During the early 1950s, another cannery was in operation.

A federally-recognized tribe is located in the community -- the Levelock Village. The population of the community consists of 95.1% Alaska Native or part Native. Levelock is a mixed Alutiiq and Yup'ik village. Commercial fishing and subsistence activities are the focus of the community. Sharing is a way of life in this village; no one goes hungry for lack of ability to hunt or fish.

## MANOKOTAK

(Pronunciation: man-noh-KOH-tuck)

**Population:** 450 (2011 DCCED Certified Estimate)

**Incorporation Type:** 2<sup>nd</sup> Class City

### Location and Climate

Manokotak is located 25 miles southwest of Dillingham on the Igushik River. It lies 347 miles southwest of Anchorage.

58.981° North Latitude and -159.058° West Longitude.

Sec. 12, T014S, R059W, Seward Meridian

Manokotak is located in a climatic transition zone. The primary influence is maritime, although the arctic climate affects the region. Average summer temperatures range from 40 to 70 °F; winter temperatures average from 4 to 30 °F. Annual precipitation averages 20 to 26 inches. Fog and high winds exist periodically through the year. The river is ice-free from June through mid-November.

### Transportation

ATVs, snowmachines, and some automobiles are used for local travel. The Manokotak trail to Dillingham is used by snowmachines during winter to haul fuel.

**Accessibility:** Air service from Dillingham, or boat.

**Airport Facilities:** state-owned 3,300' long by 75' wide lighted gravel airstrip one mile to the north and a designated seaplane base.

**Airline Services:** Regular and charter flights are available from Dillingham.

**Freight:** Lighterage services deliver cargo in summer but must pull up to the mud beach.

**Vessel Support:** No docking facilities exist on the Igushik River.

## Facilities & Utilities

### **Communications:**

**In-State Phone:** Nushagak Telephone Co-op, Inc **Long-Distance Phone:** AT&T Alascom; GCI; Nushagak Telephone

**Internet Service Provider:** GCI (www.gci.net) **Cable Provider:** Manokotak Cable Company

**TV Stations:** ARCS **Radio Stations:** KDLG-AM

**Teleconferencing:** Alaska Teleconferencing Network

**Electricity:** Manokotak Power Company

**Fuel Availability:** Diesel

**Fuel Storage - Tank Owners** (Capacity/gallons): Southwest Region Schools (20,000 gals.); Manokotak Natives Ltd. (91,100); Manokotak Power Co. (21,400); Army National Guard (1,500); Moravian Church (2,700); Manukutaag Trading Co. (1,459)

**Housing:** Lomack Rental (289-2019).

**Services:** Manukutaag Trading Co. (General Store/Grocery Store)

**Water & Sewage:** Water is derived from two wells and is stored in a 150,000-gallon water storage tank. A piped water and sewer system serves 99 households and the school's plumbing. The community has a few individual wells. Manokotak Heights, located four miles to the south, is served by a well system, but water shortages have occurred.

### **Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy:**

In 2010, 84 residents held commercial fishing permits for salmon and herring fisheries. Many residents also trap fox, beaver, mink, and otter. Most villagers leave Manokotak during the fishing season. Everyone depends heavily on fishing and subsistence activities and usually moves to Igushik or Ekuk each summer. Salmon, herring, sea lion, beluga whale, trout, ptarmigan, ducks, and berries are harvested. Sharing relationships exist with several area villages, especially Togiak and Twin Hills. The government provides the majority of the employment in the area.

### **Culture & Demographics:**

Manokotak is one of the newer villages in the Bristol Bay region. It became a permanent settlement in 1946-47 with the consolidation of the villages of Igushik and Tuklung. People also migrated from Kulukak, Togiak, and Aleknagik. Igushik is now used as a summer fish camp by many of the residents of Manokotak. School was conducted in a church constructed in 1949 until a school was built in 1958-59. A post office was established in 1960. Trapping has been an attractive lure to the area, although it has declined since the 1960s. The city was incorporated in 1970. Manokotak is the fourth most populated village in the Dillingham census area.

A federally-recognized tribe is located in the community -- the Manokotak Village. Manokotak is a Yup'ik Eskimo village with a fishing, trapping, and subsistence lifestyle. The sale, importation, and possession of alcohol is banned in the village.

9770.2.18 - Naknek

**Web:** <http://www.bbha.org>

**Location and Climate**

Naknek is located on the north bank of the Naknek River, at the northeastern end of Bristol Bay. It is 297 miles southwest of Anchorage. The community lies at approximately 58.728330° North Latitude and -157.013890° West Longitude. (Sec. 03, T017S, R047W, Seward Meridian.) Naknek is located in the Kvichak Recording District. The climate is mainly maritime, characterized by cool, humid, and windy weather. Average summer temperatures range from 42 to 63 °F; average winter temperatures range from 29 to 44 °F. Extremes from -46 to 88 ° F have been recorded. Total precipitation averages 20 inches annually, with 45 inches of snowfall. Fog is common during summer months.

**Transportation**

Pickup trucks and cars are common.

**Accessibility:** Air service from King Salmon, boat, or a 15.5-mile road via King Salmon.

**Airport Facilities:** The Tippetts Airport has a lighted 1,700' long by 60' wide gravel runway. The state-owned Naknek Airport is located one mile north of Naknek. It has a 1,950' long by 50' wide lighted gravel runway, a 1,850' long and 45' wide gravel runway, and 2,000' float plane landing area.

**Airline Services:** Scheduled or charter air service from King Salmon

**Freight:** The borough operates the cargo dock at Naknek, which is the port of Bristol Bay.

**Vessel Support:** It has 800' of berthing space, a concrete surface, and a couple of cranes. No commercial docking facilities are available at the canneries.

### **Facilities & Utilities**

- Bristol Bay Borough (48,500)

#### **Housing:**

- Cottonwood Lodge
- Naknek Hotel/D&D Restaurant (246-4430)

**Services:** Taxis are available.

**Water & Sewage:** No water service. The majority of households have individual wells. Sewer service is available and serves most homes. The homes not served by the community sewer system have individual septic tanks.

#### **Miscellaneous:**

#### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

#### **Economy**

The economy is based on government employment, salmon fishing, and processing. Naknek has a seasonal economy as a service center for the huge red salmon fishery in Bristol Bay. In 2009, 105 residents held commercial fishing permits, and several thousand people typically flood the area during the fishing season. Millions of pounds of salmon are trucked over the Naknek to King Salmon road each summer, where jets transport the fish to the lower 48. Trident Seafoods, North Pacific Processors, Ocean Beauty, and other fish processors operate facilities in Naknek. Naknek is also the seat of the Bristol Bay Borough.

### **History, Culture & Demographics**

This region was first settled over 6,000 years ago by Yup'ik Eskimos and Athabascan Indians. In 1821, the original Eskimo village of "Naugeik" was noted by Capt. Lt. Vasiliev. By 1880, the village was called Kinuyak. It was later spelled Naknek by the Russian Navy. The Russians built a fort near the village and fur trappers inhabited the area for some time prior to the U.S. purchase of Alaska. The first salmon cannery opened on the Naknek River in 1890. By 1900, there were approximately 12 canneries in Bristol Bay. The Homestead Act enabled canneries to acquire land for their plants and also made land available to other institutions and individuals. The parcel owned by the Russian Orthodox Church on the north bank of the River was the first land recorded in Naknek. Squatters built shelters on the church property and were eventually sold lots in what became the center of Naknek. A post office was established in 1907. Naknek has developed over the years as a major fishery center.

A federally-recognized tribe is located in the community -- the Naknek Village. The population of the community consists of 47.1% Alaska Native or part Native. Naknek is a fishing community, with a mixed population of non-Natives, Yup'ik Eskimos, Alutiiq, and Athabascans.

9770.2.19 – New Stuyahok

| Village Corporation | Stuyahok Limited | 693-3122 | 693-3148 |
|---------------------|------------------|----------|----------|

### **Location and Climate**

New Stuyahok is located on the Nushagak River, about 12 miles upriver from Ekwok and 52 miles northeast of Dillingham. The village has been constructed at two elevations -- one 25 feet above river level and one about 40 feet above river level.

59.452° North Latitude and -157.312° West Longitude.

Sec. 29, T008S, R047W, Seward Meridian.

New Stuyahok is located in a climatic transition zone. The primary influence is maritime, although a continental climate affects the weather. Average summer temperatures range from 37 to 66 °F; winter temperatures average 4 to 30 °F. Annual precipitation ranges from 20 to 35 inches. Fog and low clouds are common during the summer; strong winds often preclude access during the winter. The river is ice-free from June through mid-November.

### **Transportation**

Skiffs, ATVs, and snowmachines are the prevalent forms of local transportation.

**Accessibility:** Air service from Dillingham, or boat.

**Airport Facilities:** State-owned gravel airstrip is 3,281' long by 98' wide. Note: The airstrip is located on a hilltop and windy conditions often preclude landing.

**Airline Services:** Regular and charter flights are available from Dillingham.

**Freight:** Goods are lightered on a regular basis during the summer.

**Vessel Support:** N/A.

### **Facilities & Utilities**

- The Traditional Council (693-3173)

**Services:** Panorqukuk Store (General Store/Grocery Store)

**Water & Sewage:** Water is derived from a well and treated. The majority of housing and facilities, as well as the school, have complete plumbing and are connected to a piped water and sewer system.

**Miscellaneous:**

**Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

**Economy:**

The primary economic base in New Stuyahok is the salmon fishery; in 2010, 24 residents held commercial fishing permits. Many trap as well. The entire community relies upon subsistence foods. Subsistence items are often traded between communities. Salmon, moose, caribou, rabbit, ptarmigan, duck, and geese are the primary sources of meat.

**Culture & Demographics:**

The present location is the third site that villagers can remember. The village moved downriver to the Mulchatna area from the "Old Village" in 1918. During the 1920s and 30s, the village was engaged in herding reindeer for the U.S. government. However, by 1942, the herd had dwindled to nothing, the village had been subjected to flooding, and the site was too far inland to receive barge service. So, in 1942, the village moved downriver again to its present location. Stuyahok appropriately means "going downriver place." The first school was built in 1961. A post office was also established that year. An airstrip was built soon thereafter, and the 1960s saw a 40% increase in the village population. The city was incorporated in 1972.

A federally-recognized tribe is located in the community -- the New Stuyahok Village. New Stuyahok is a southern Yup'ik Eskimo village with Russian Orthodox influences. Residents practice a fishing and subsistence lifestyle.

- City Clinic (3,500 gals.)
- Nondalton Village Corp. (165,000)
- Lake & Peninsula Schools (5,000)
- City (191,700)

**Housing:**

- Gram's B&B (571-1232)
- Roadhouse Inn (571-6485)
- Airport Hotel
- Iliamna Lake Lodge (571-1525).

**Services:** The village council operates a washeteria. There are car rentals available at Gram's B&B. Taxi service is provided by Wilderness Cab and Riverside Cab.

**Water & Sewage:** Water is derived from a well and is treated at the washeteria. A piped water system serves all 40 homes. Most residences are fully plumbed, with individual septic systems for sewer. The city provides septic pumping services.

**Miscellaneous:**

**Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

**Economy**

Most of the employment is seasonal; many work in Bristol Bay fisheries or in Iliamna. Thousands of sport fishermen visit the area each summer for trophy rainbow trout fishing on the lake. Residents rely heavily on subsistence activities, and most families travel to fish camps during the summer. Salmon, trout, grayling, moose, caribou, rabbit, porcupine, and seal are utilized.

**Culture & Demographics**

The 1890 census listed the Eskimo village of "Noghelingamiut," meaning "people of Noghelin," at this location, with 16 residents. The present name is an Anglicized version of the original. The village was established in the late 1800s due to the bountiful fish and game in the immediate area. Newhalen incorporated as a city in 1971.

A federally-recognized tribe is located in the community -- the Newhalen Village. Newhalen includes Yup'ik Eskimos, Alutiiqs, and Athabascans. Most practice a subsistence and fishing lifestyle. Newhalen and Iliamna share a post office and school.

#### Location and Climate

Nondalton is located on the west shore of Six Mile Lake, between Lake Clark and Iliamna Lake, 190 miles southwest of Anchorage.

59.972° North Latitude and -154.848° West Longitude.  
Sec. 30, T002S, R032W, Seward Meridian

Nondalton lies in the transitional climatic zone. Average summer temperatures range from 42 to 62 °F; winter temperatures average 6 to 30 °F. The record high is 91 °F, and the record low is -47 °F. Annual average rainfall is 26 inches, with 64 inches of snowfall.

#### Transportation

**Accessibility:** Air service or boat. Skiffs and barges are used to transport people and goods from Nondalton to Fish Camp, which connects to Iliamna via a cat road.

**Airport Facilities:** State-owned 2,800' long by 75' wide gravel runway services the community.

**Airline Services:** Scheduled and charter air services are available. Iliamna Air Taxi (daily scheduled flights may not be available)

**Freight:** Bulk goods are received in Iliamna then taken by a cat-trail to Fish Camp, located across from Nondalton on the east side of the lake, where they are ferried by skiff or barge to the west side.

**Vessel Support:** There are no docking facilities.

**Water & Sewage:** An infiltration gallery at Six Mile Lake supplies the community with treated water. There are 88,000 gallons of storage capacity. Most residences are connected to the piped water and sewer system and are fully plumbed.

**Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy:**

Fishing in Bristol Bay is an important source of income in Nondalton. One source of summer employment is firefighting. The community relies heavily on subsistence hunting and fishing. Many families travel to fish camp each summer. Salmon, trout, grayling, moose, caribou, bear, dall sheep, rabbit, and porcupine are utilized.

### **Culture & Demographics:**

Nondalton is a Tanaina Indian name first recorded in 1909 by the U.S. Geological Survey. The village was originally located on the north shore of Six Mile Lake, but in 1940 growing mudflats and wood depletion in the surrounding area caused the village to move to its present location on the west shore. The post office, established in 1938, relocated with the villagers. Nondalton formed an incorporated city government in 1971.

A federally-recognized tribe is located in the community -- the Nondalton Village. It is a Tanaina Indian (Athabascan and Iliamna) village with a fishing and subsistence lifestyle. The sale of alcohol is prohibited in the community, although importation and possession are allowed.

**Limiting Factors for Spill Response:** Food Supply (air freight from Anchorage); limited lodging

**Top Two Sensitive Areas to Protect in the event of a Spill:** Salmon spawning ponds, Pedro Creek, and Iliamna Lake.

### **Economy**

Most residents obtain summer employment in the Bristol Bay fishery or in Iliamna Lake tourism services. Several wilderness lodges operate in Pedro Bay. In 2009, three area residents held commercial fishing permits. Most families depend heavily on subsistence activities, utilizing salmon, trout, moose, bear, rabbit, and seal.

### **Culture and Demographics**

Pedro Bay is a Dena'ina Indian village with a subsistence lifestyle. The Dena'ina Indians have occupied this area historically. The Dena'ina warred with Russian fur traders over trade practices in the early 1800s. The community was named for a man known as "Old Pedro," who lived in this area in the early 1900s. A post office was established in the village in 1936.

A federally-recognized tribe is located in the community -- the Pedro Bay Village. The population of the community consists of 64% Alaska Native or part Native. Pedro Bay is a Dena'ina Indian village with a subsistence lifestyle.

**Location and Climate**

Perryville is located on the south coast of the Alaska Peninsula, 275 miles southwest of Kodiak and 500 miles southwest of Anchorage. The community lies at approximately 55.912780° North Latitude and -159.145560° West Longitude. (Sec. 27, T049S, R064W, Seward Meridian.) Perryville is located in the Aleutian Islands Recording District. Perryville's maritime climate is characterized by cool summers, warm winters, and rainy weather. Average summer temperatures range from 39 to 60 °F; winter temperatures average 21 to 50 °F. Low clouds, rain squalls, fog, and snow showers frequently limit visibility. Average annual precipitation is 127 inches, with 58 inches of snow.

**Transportation**

ATVs and skiffs are the primary means of local transportation.

**Accessibility:** Air service from King Salmon, or boat.

**Airport Facilities:** -owned 3,300' long by 75' wide gravel runway and seaplane base.

**Airline Services:** Scheduled and charter flights are available from King Salmon.

**Freight:** Cargo barges deliver fuel and supplies each spring.

**Vessel Support:** Cargo barges deliver fuel and supplies each spring.

**Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

In 2009, seven residents held commercial fishing permits for the Chignik salmon fishery. During the summer, the majority of residents leave Perryville to fish in Chignik or Chignik Lagoon. Only a few year-round jobs are available. Some trap during the winter, and all rely heavily on subsistence food sources. Salmon, trout, marine fish, crab, clams, moose, caribou, bear, porcupine, and seal are harvested.

### **History, Culture & Demographics**

The community was founded in 1912 as a refuge for Alutiiq people driven away from their villages by the eruption of Mt. Katmai. Many villagers from Douglas and Katmai survived the eruption because they were out fishing at the time. Captain Perry of the ship "Manning" transported people from the Katmai area to Ivanof Bay and later to the new village site. The village was originally called "Perry," but the "ville" was added to conform to the post office name, established in 1930.

A federally-recognized tribe is located in the community -- the Native Village of Perryville. The population of the community consists of 98.1% Alaska Native or part Native. The village maintains an Alutiiq culture and a subsistence lifestyle. Commercial fishing provides cash income.

**Water & Sewage:** No water or sewer service. Water supply is from individual wells or cisterns. Sewage disposal is served by individual septic tanks and outhouses.

**Miscellaneous:**

### **Spill Response Support**

ADEC has an equipment conex and a Community Spill Response Agreement with the community of Pilot Point.

### **Economy**

The residents of Pilot Point depend upon commercial fishing for the majority of their cash income. In 2009, 13 residents held commercial fishing permits. Up to 700 commercial boats fish in the district. Subsistence is an important part of the community lifestyle, and trapping is a source of income during the off-season. Salmon, caribou, moose, geese, and porcupine are harvested.

### **History, Culture & Demographics**

This mixed Aleut and Eskimo community developed around a fish salting plant established by C.A. Johnson in 1889. At that time, it was called "Pilot Station," after the river pilots stationed here to guide boats upriver to a large cannery at Ugashik. In 1892, Charles Nelson opened a

saltery, which was sold to the Alaska Packer's Association in 1895. The saltery continued to expand and by 1918 had developed into a three-line cannery. Many immigrants came to work in the canneries - Italians, Chinese, and northern Europeans. Reindeer-herding experiments at Ugashik helped to repopulate the area after the devastating 1918 flu epidemic, although the herding eventually failed. A Russian Orthodox church and a Seventh Day Adventist church were built in the village. A post office was established in 1933, and the name was changed to Pilot Point at that time. The deterioration of the harbor forced the cannery to close in 1958. Pilot Point incorporated as a city in 1992.

A federally-recognized tribe is located in the community -- the Native Village of Pilot Point. The population of the community consists of 86% Alaska Native or part Native. There is a history of ethnic diversity in Pilot Point. The community is primarily of Alutiiq and Yup'ik ancestry. Inhabitants practice a fishing and subsistence lifestyle.

9770.2.25 – Port Alsworth

**PORT ALSWORTH** - Other Names: aka Tanalian

**Population:** 156 (2011 AK Dept of Labor Estimate)

**Incorporation Type:** Unincorporated

**Location and Climate**

Port Heiden is 424 miles southwest of Anchorage, at the mouth of the Meshik River, on the north side of the Alaska Peninsula. It lies near the Aniakchak National Preserve and Monument. The community lies at approximately 56.948390° North Latitude and -158.629020° West Longitude. (Sec. 27, T037S, R059W, Seward Meridian.) Port Heiden is located in the Kvichak Recording District. The area encompasses 50.7 sq. miles of land and 0.7 sq. miles of water. Port Heiden has a maritime climate, with cool summers, relatively warm winters, and rain. Snowfall averages 58 inches per year. January temperatures average 25 °F, and July temperatures average 50 °F.

### **Transportation**

Autos, ATVs, and snowmachines are the local means of transportation.

**Accessibility:** Air service.

**Airport Facilities:** State-owned airport consists of a lit gravel 5,000' long by 100' wide runway and a 4,000' long by 100' wide lighted gravel crosswind runway.

**Airline Services:** N/A

**Freight:** A boat haul-out, a beach off-loading area, and marine storage facilities are available. Cargo from Seattle is delivered twice yearly by a BIA-chartered barge and is lightered and offloaded on the beach.

**Vessel Support:** There is a natural boat harbor but no dock. A boat haul-out, a beach off-loading area, and marine storage facilities are available.

### **Facilities & Utilities**

#### **Communications:**

*In-State Phone:* ACS of the Northland

*Long-Distance Phone:* GCI

#### **Services:**

**Water & Sewage:** No water or sewer service. Most households use individual wells and septic tank systems.

#### **Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

Commercial fishing and government jobs provide the majority of cash income. In 2009, 12 residents held commercial fishing permits. Subsistence harvests of salmon, other fish, and

marine mammals average 109 pounds per person. Game, birds, plants, and berries are also an important part of villagers' diets.

### **History, Culture & Demographics**

The old village of Meshik was located at the current site of Port Heiden. Influenza epidemics during the early 1900s forced residents to relocate to other villages. During World War II, Fort Morrow was built nearby and 5,000 personnel were stationed at the base. The fort was closed after the war. A school was established in the early 1950s, which attracted people from surrounding villages. Port Heiden incorporated as a city in 1972. The community relocated inland, because storm waves had eroded much of the old townsite and threatened to destroy community buildings.

A federally-recognized tribe is located in the community -- the Native Village of Port Heiden. The population of the community consists of 78.2% Alaska Native or part Native. Port Heiden is a traditional Alutiiq community, with a commercial fishing and subsistence lifestyle.

9770.2.27 – Portage Creek

**PORTAGE CREEK - (a.k.a. Ohgsenakale)**

Web: <http://www.bbha.org>

**Location and Climate**

Portage Creek is located at the mouth of Portage Creek, a tributary of the Nushagak River, 29 miles southeast of Dillingham. The community lies at approximately 58.900160° North Latitude and -157.661530° West Longitude. (Sec. 01, T015S, R051W, Seward Meridian.) Portage Creek is located in the Bristol Bay Recording District. Portage Creek is located in a climatic transition zone. The primary influence is maritime, although a continental climate affects the weather. Average summer temperatures range from 30 to 66 °F; winter temperatures range from well below 0 to 30 °F. Annual precipitation ranges from 20 to 35 inches. Fog and low clouds are common during the summer. The river is ice-free from June through mid-November.

**Transportation**

Snowmachines are used for winter travel.

**Accessibility:** Chartered air transport and skiffs.

**Airport Facilities:** State-owned 1,470' long by 60' wide gravel airstrip, maintained only during summer months, and seaplanes may land on the Nushagak River.

**Airline Services:** charter air service

**Freight:** Cargo goods are lightered to the beach.

**Vessel Support:** there are no docking facilities.

### **Facilities & Utilities**

#### **Communications:**

*In-State Phone:* Nushagak Telephone Co-op, Inc.

*Long-Distance Phone:* AT&T Alascom

*Internet Service Provider:* School Only - GCI ([www.gci.net](http://www.gci.net))

*Cable Provider:* None

*TV Stations:* ARCS

*Radio Stations:* KYMG-FM; KDLG-AM

*Teleconferencing:* N/A

**Electricity:** Individual Generators

**Fuel Availability:** Diesel

**Fuel Storage - Tank Owners (Capacity):** N/A

**Housing:**

**Services:**

**Water & Sewage:** No water or sewer service. A central well exists but it is rusty so water is hauled from downriver by residents. Honeybuckets are used for sewage disposal.

**Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

Everyone depends to some extent on subsistence activities for various food sources. Most families have fish camps at Ekuk or Lewis Point. Salmon, moose, caribou, duck, geese, and berries are harvested. An exchange relationship exists between Portage Creek and the coastal communities; walrus seal, and herring roe are sought. The Portage Creek General Store and Lodge operates during the summer months.

### **History, Culture & Demographics**

This site was used by the Yup'ik Eskimos as an overnight summer camp. Portage Creek was so named because it was used to portage boats from the Nushagak River to the Kvichak River. In this way, travelers could avoid the open waters of Bristol Bay and the long trip around Etolin Point. The village was permanently settled in 1961 by some families from Koliganek and other villages up the Nushagak River. A BIA school was established in 1963, and, during the winter of 1964-65, 11 families lived in Portage Creek. In 1965 the village was served by a local, scheduled air carrier. Through the mid-1980s, Portage Creek was an active community, but the population has since declined.

A federally-recognized tribe is located in the community -- the Portage Creek Village (aka Ohgsenakale). The population of the community consists of 86.1% Alaska Native or part Native.

The village is a popular recreational fishing and camping site from May through July and a hunting location for Yup'ik residents.

9770.2.28 – South Naknek

**SOUTH NAKNEK** - (Pronunciation: NACK-neck; a.k.a. Qinuyang)

**Location and Climate**

South Naknek is located on the south bank of the Naknek River on the Alaska Peninsula, 297 miles southwest of Anchorage. It lies just west of the Katmai National Park and Preserve. The community lies at approximately 58.715560° North Latitude and -156.998060° West Longitude. (Sec. 11, T017S, R047W, Seward Meridian.) South Naknek is located in the Kvichak Recording District. The climate is mainly maritime and is characterized by cool, humid, and windy weather. Average summer temperatures range from 42 to 63 °F; average winter

temperatures range from 29 to 44 °F. Extremes from -46 to 88 °F have been recorded. Total precipitation averages 20 inches annually, with 45 inches of snowfall. Fog is common during summer months.

### **Transportation**

Trucks, cars, ATVs, snowmachines, and boats are used for local travel.

**Accessibility:** Air service or boat.

**Airport Facilities:** There are two state-owned lighted gravel runways. One is 2,264' long by 60' wide, and the other is 3,314' long by 60' wide. The PAF Cannery airport lies three miles to the southeast. It has a 750' long by 30' wide dirt strip and a 650' long by 75' wide crosswind strip.

**Airline Services:** Scheduled and charter flight services are available. A 3,000' designated stretch of the Naknek River is used by float planes.

**Freight:** The frozen river provides an ice road to Naknek and King Salmon in winter. There is an unmaintained dirt road to New Savonoski. The borough operates a mid- and high-tide cargo dock at South Naknek with 200' of berth space to accommodate barges.

**Vessel Support:** The borough operates a mid- and high-tide cargo dock at South Naknek with 200' of berth space to accommodate barges.

#### **Fuel Storage - Tank Owners (Capacity):**

- Kodiak Ventures (150,100 gals.)
- Bristol Bay Schools (24,000)
- Trident Seafoods (78,000)
- Peter Pan Seafoods (15,000)

**Housing:** Nielsen Enterprises (907-246-6552).

#### **Services:**

**Water & Sewage:** Water and sewer service are available however, the majority of homes use individual wells and septic systems.

#### **Miscellaneous:**

### **Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

### **Economy**

Commercial fishing and salmon processing are the mainstays of South Naknek's economy. In 2009, 28 residents held commercial fishing permits. Trident Seafoods operates in South Naknek. A second processing facility, owned by Wards Cove Packing, closed in 2002. Most other

employment is in public services. A few people trap, and most residents depend on subsistence hunting and fishing. Salmon, trout, caribou, rabbit, porcupine, and seal are utilized.

### **History, Culture & Demographics**

This area was first settled over 6,000 years ago and was historically Sugpiaq Aleut territory. The Sugpiaqs traveled between Katmai and the Naknek River, pursuing seasonal food sources. South Naknek was settled permanently after the turn of the century as a result of salmon cannery development. Some villagers relocated from New and Old Savonoski, near the "Valley of Ten Thousand Smokes." This is one of the many villages along the coast where Laplanders were brought in to herd reindeer. The herds were purchased in the 1930s by the BIA for the local Native economy.

A federally-recognized tribe is located in the community -- the South Naknek Village. The population of the community consists of 83.9% Alaska Native or part Native. South Naknek is a traditional Sugpiaq village with a fishing and subsistence lifestyle.

9770.2.29 – Togiak

### **Location and Climate**

Togiak is located at the head of Togiak Bay, 67 miles west of Dillingham. It lies in Togiak National Wildlife Refuge and is the gateway to Walrus Island Game Sanctuary. The community lies at approximately 59.061940° North Latitude and -160.376390° West Longitude. (Sec. 12, T013S, R067W, Seward Meridian.) Togiak is located in the Bristol Bay Recording District. The area encompasses 45.2 sq. miles of land and 183.3 sq. miles of water. Togiak is located in a climatic transition zone; however, the arctic climate also affects this region. Average summer temperatures range from 37 to 66 °F; winter temperatures average 4 to 30 °F. Precipitation averages 20 to 26 inches annually. Fog and high winds are prevalent during the winter. The bay is ice-free from June through mid-November.

### **Transportation**

Skiffs, autos, ATVs, and snowmachines are used for local transportation.

**Accessibility:** Air service from Dillingham, or boat.

**Airport Facilities:** state-owned 4,400' long by 75' wide lighted gravel airstrip with a 981' long by 59' wide crosswind airstrip is available.

**Airline Services:** Scheduled and chartered flights are dispatched from Dillingham.

**Freight:** Freight is brought in by air or barge and lightered to shore.

**Vessel Support:** There are no docking facilities.

### **Facilities & Utilities**

**Services:**

**Water & Sewage:** Water and sewer service is available. Water is derived from a well. A small number of homes are not connected to water or sewer service. Those homes use individual wells and septic tanks.

**Miscellaneous:**

**Spill Response Support**

*Contact local officials to determine possibility of using community facilities.*

**Economy**

Togiak's economic base is primarily commercial salmon, herring, and herring roe-on-kelp fisheries. In 2009, 224 residents held commercial fishing permits; fishermen use flat-bottom boats for the shallow waters of Togiak Bay. There is one on-shore fish processor and several floating processing facilities near Togiak. The entire community depends heavily on subsistence activities. Salmon, herring, seal, sea lion, whale, and walrus are among the species harvested. A few residents trap.

**History, Culture & Demographics**

In 1880 "Old Togiak" or "Togiagamute" was located across the bay and had a population of 276. Heavy winter snowfalls made wood-gathering difficult at Old Togiak, so gradually people settled at a new site on the opposite shore, where the task was easier. Many residents of the Yukon-Kuskokwim region migrated south to the Togiak area after the devastating influenza epidemic in 1918-19. A school was established in an old church in 1950. A school building and a National Guard armory were constructed in 1959. Togiak was flooded in 1964, and many fish racks and stores of gas, fuel oil, and stove oil were destroyed. Three or four households left Togiak after the flood and developed the village of Twin Hills upriver. The city government was incorporated in 1969.

A federally-recognized tribe is located in the community -- the Togiak Traditional Council. The population of the community consists of 92.7% Alaska Native or part Native. Togiak is a traditional Yup'ik Eskimo village with a fishing and subsistence lifestyle. The sale, importation, and possession of alcohol are banned in the village.

### **Location and Climate**

Twin Hills is located near the mouth of the Twin Hills River, a tributary of the Togiak River, 386 miles southwest of Anchorage. The community lies at approximately 59.079170° North Latitude and -160.275000° West Longitude. (Sec. 03, T013S, R066W, Seward Meridian.) Twin Hills is located in the Bristol Bay Recording District.

The area experiences a transitional climate that is primarily maritime, although the arctic climate also affects this region. Average summer temperatures range from 37 to 66 °F; winter temperatures average 4 to 30 °F. Annual precipitation ranges from 20 to 26 inches. Fog and high winds are prevalent during winter months. The Togiak River is ice-free from June through mid-November.

### **Transportation**

Cars, ATVs, and snowmachines are used for local transportation. Residents drive along the beach to access the Togiak Fisheries cannery. A winter trail for snowmachines connects Twin Hills with Togiak.

**Accessibility:** Air service from Dillingham or boat.

**Airport Facilities:** state-owned 3,000' long by 60' wide lighted gravel runway on a ridge east of the village.

**Airline Services:** Scheduled or charter air service from Dillingham

**Freight:** Most cargo is delivered by air.

**Vessel Support:** There is a boat landing area but no docking facilities; bulk goods must be lightered to shore.

### **Facilities & Utilities**

#### **Communications:**

*In-State Phone:* United Utilities, Inc.

*Long-Distance Phone:* United Utilities, Inc.

*Internet Service Provider:* United Utilities, Inc.

*Cable Provider:* None

*TV Stations:* ARCS

*Radio Stations:* KDLG-AM

*Teleconferencing:* Alaska Teleconferencing Network

**Electricity:** Twin Hills Village Council

**Fuel Availability:** Diesel

#### **Fuel Storage - Tank Owners (Capacity):**

- Village Council (29,400 gals.)
- Southwest Region Schools (31,300)
- Togiak Fisheries Inc. (127,500)

#### **Housing:**

**Services:** A coin-operated washeteria is available.

**Water & Sewage:** Water and sewer service is available. Water supply is from a submersible pump and sewage treatment is a disposal lagoon on the far west side of town. Some homes use individual wells and septic tanks.

### **SPILL RESPONSE SUPPORT**

*The following facilities may be available to support a spill response. Contact local communities for additional information.*

### Economy

Steady employment is limited to those working for the village council and post office. In 2009, seven residents held commercial fishing permits, primarily for salmon, herring, herring roe on kelp, or sac roe. Fishermen use special flat-bottomed boats for the shallow waters of Togiak Bay. Togiak Fisheries and other cash buyers provide a market for fishermen. The community depends heavily on subsistence activities for various food sources. Seal, sea lion, walrus, whale, salmon, clams, geese, and ducks are harvested. An exchange relationship exists between Twin Hills, Togiak, and Manokotak. Seal oil is exchanged for blackfish. Handicrafts also supplement incomes.

### Culture and Demographics:

Twin Hills is a traditional Yup'ik Eskimo village with a fishing and subsistence lifestyle. The sale, importation, and possession of alcohol is banned in the village.

The village was established in 1965 by families who moved from Togiak to avoid the recurrent flooding there. Some residents migrated from Quinhagak on Kuskokwim Bay. The people have strong cultural ties to the Yukon-Kuskokwim region, because many of their ancestors migrated to Togiak following the 1918-19 influenza epidemic. School was first conducted in the church during 1967-68. A school building was constructed in 1972, but it burned in 1976. A new school was built in 1978. A post office was established around 1977, although there have been some interruptions of service.

A federally-recognized tribe is located in the community -- the Twin Hills Village. The population of the community consists of 94.2% Alaska Native or part Native. Twin Hills is a traditional Yup'ik Eskimo village with a fishing and subsistence lifestyle. The sale, importation, and possession of alcohol is banned in the village.

| Ugashik River |                      | Valuable Local Resource |

### **Economy**

In 2009, four residents held commercial fishing permits. Subsistence activities provide food sources, including salmon, trout, grayling, moose, caribou, and bear.

### **History, Culture & Demographics**

It is a traditional site of the Alutiiq; however very few people now live in Ugashik year-round. Some of the village's people live in nearby Pilot Point on the coast. Tribal members live throughout Alaska, California, and Washington. Commercial fishing, fish processing, and subsistence activities sustain residents of the area.

Yup'ik Eskimos and Aleuts jointly occupied the area historically. This Aleut village was first recorded in 1880 as "Oogashik." In the 1890s, the Red Salmon Company developed a cannery, and Ugashik became one of the largest villages in the region. The 1919 flu epidemic decimated the population. The cannery has continued to operate under various owners. The Briggs Way Cannery opened in 1963. The village has a small year-round population.

A federally-recognized tribe is located in the community -- the Ugashik Traditional Council. The population of the community consists of 81.8% Alaska Native or part Native. It is a traditional site of the Alutiiq; however very few people now live in Ugashik year-round. Some of the village's people live in nearby Pilot Point on the coast. Tribal members live throughout Alaska, California, and Washington. Commercial fishing, fish processing, and subsistence activities sustain residents of the area.

| <b><i>Location and Climate</i></b>                 | <p>Alexander is located on the Susitna River Delta, which flows into Cook Inlet, near the mouth of Alexander Creek, 27 miles northwest of Anchorage across Cook Inlet. It lies at approximately Latitude 61.4218 Longitude -150.5999</p> <p>Alexander Creek falls within the transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.</p> <p><i>*Alexander Creek is a remote location with few year-round residents, with access primarily by air (no road access). Goods and services can be obtained in Anchorage and transported to this location as necessary.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>History, Culture, &amp; Demographics</i></b> | <p>Alexander Creek, with the Native name Tuqentnu (originally translated as Taguntna Creek), empties into the Susitna River just a few miles from its mouth in Cook Inlet. The historical Alexander Creek Village, known as Tuqen Kaq by its original Alaska Native inhabitants, is located just over 27 miles northwest of Anchorage, Alaska. The community was first noted as a small Indian village in 1898 by the U.S. Geological Survey. Tuqen Kaq was a large village with abundant resources. But the whooping cough, measles and influenza epidemics in the early 1900's decimated the Native population and after the influenza epidemic of 1918, the few survivors of the Alexander Creek Village moved to Tyonek. By 1939 the Alexander Creek site had been re-occupied by Native families. The village of Alexander Creek became a popular location for sport fishing during and after World War II because of its easy accessibility from Anchorage.</p> <p>The residential population is mostly Alaska Native; there is an increasing population of recreational-use cabin owners who are not native. Census information is not tracked for this community.</p> |

|                           |                                                                                                                                                                                                  |                                                       |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
|                           | Population fluctuates seasonally (summer and winter residents). Members of Alexander Creek have been working on becoming a federally-recognized tribe; however, they are recognized under ANCSA. |                                                       |
| <b>Economy</b>            |                                                                                                                                                                                                  |                                                       |
| <b>Subsistence</b>        | Hunting and fishing are important local activities and food sources, particularly for members of the Alexander Creek, Inc. who have land allotments in the area.                                 |                                                       |

| <b>ANCHOR POINT</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location and Climate</b>                 | <p>Anchor Point is located on the Kenai Peninsula at the junction of the Anchor River and its north fork, 14 miles northwest of Homer. It lies at mile 156 of the Sterling Highway. Latitude 59.7767 Longitude -151.8314 Anchor Point falls within the gulf coast transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.</p> <p><i>*Anchor Point relies on Homer for many supplies and services. Please refer to the Homer community profile for facilities and services.</i></p> |
| <b>History, Culture, &amp; Demographics</b> | <p>In the summer of 1778, Captain James Cook and crews of the Resolution and Discovery sailed into the Inlet looking for a Northwest Passage and gave Anchor Point its name after losing a kedge anchor to the awesome tidal currents. A post office was established in 1949.</p> <p>Anchor Point has a visitor's center, a chamber of commerce, the Two Rivers Coalition (an organization formed to examine the watershed).</p>                                                                                                     |

| <b>Accessibility</b> | The Sterling Highway provides access to Anchorage. A boat launch/retrieval service is available at the mouth of Anchor River; however, the boat launch is seasonal, but small boats may be launched in the river. Additional information can be found in the following website: <a href="http://dnr.alaska.gov/parks/units/anchoriv.htm">http://dnr.alaska.gov/parks/units/anchoriv.htm</a> . Nearby Homer offers an airport, state ferry access, and docking and boat launching facilities (See the Homer Community Profile). |

| <b><i>History, Culture, &amp; Demographics</i></b> | <p>Construction began in 1914 on a federal railroad from the port of Seward, 126 miles south of Anchorage, through the coalfields of Interior Alaska, to the gold claims near Fairbanks, 358 miles to the north. The midpoint construction headquarters was Anchorage, and, by July of 1915, thousands of job seekers and opportunists had poured into the area, living in a tent city on the banks of Ship Creek near the edge of the present downtown. City of Anchorage was incorporated in 1920. From 1939 to 1957, major military impacts and government construction of roads, airports, and harbors throughout Alaska contributed to the growth of Anchorage. The port was completed by the early 1960s. The Greater Anchorage Area Borough was formed in 1964. The Good Friday earthquake in 1964 destroyed a large part of the city. During the 1970s, the development of the Prudhoe Bay oilfields and the Trans-Alaska Pipeline brought rapid growth to Anchorage; population, office space, and housing tripled within a ten-year period. On Sept. 15, 1975, the city and borough governments were unified, along with the cities of Girdwood and Glen Alps.</p> <p>Anchorage has a history of cultural diversity. Many residents participate in nearby recreational and subsistence activities. Anchorage has over 162 parks, including 10 large reserves. Recreation activities include downhill and cross-country skiing, ice hockey, fishing, golf, swimming, hiking, biking, and camping. The George Sullivan Sports Arena, Alaska Performing Arts Center, Egan Convention Center, and many other facilities host cultural and entertainment events.</p> |                                                               |
| <b><i>Economy</i></b>                              | Anchorage is the commercial and transportation hub for the state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                               |

| <b>Location and Climate</b>                 | <p>Big Lake is a community on the shore of Big Lake, 13 miles southwest of Wasilla, in the Chugach Mountains. It lies adjacent to Houston and Knik-Fairview. Latitude 61.5256 Longitude -149.9415</p> <p>Big Lake falls within the transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.</p> <p><i>*Big Lake relies on Wasilla for many supplies and services. Please refer to the Wasilla community profile for facilities and services.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>History, Culture, &amp; Demographics</b> | <p>Early inhabitants were the Athabascan Dena'ina Natives. Around 1899, the Boston and Klondike Company made the first sled trail north into the Talkeetna Mountains from Knik via Big Lake. Homesteaders in 1929 and after World War II settled Big Lake. Materials were transported from Pittman Railroad Station over eleven miles of rough trail. By 1959, a number of lodges and several children's camps were operating on the lake, and at least 300 cottages and camps were owned by individuals. Lake-front lots became accessible in the 1960s and 1970s, with the expansion of roads and power. In June 1996, the "Miller's Reach" wildfire destroyed more than 37,500 acres in the Big Lake and Houston area, including 433 buildings and homes valued at \$8.9 million. Low housing costs, the semi-rural lifestyle, and a 45-minute commute to Anchorage have supported growth in the Mat-Su Valley.</p> <p>Boating and fishing are extremely popular on the lake during the summer months. High school students attend Houston Middle and High Schools.</p> |
| <b>Economy</b>                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Subsistence</b>                          | Hunting and fishing are important local activities and food sources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                             | Butte falls within the transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.<br><i>* Butte relies on Palmer for many supplies and services. Please refer to the Palmer community profile for facilities and services.</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>History, Culture, &amp; Demographics</b> | Athabascan Dena'ina Natives traveled through the Butte area on a winter trail from Eklutna up the Knik River to the Copper River. A large Dena'ina village called Hutnaynut'l, or "burnt over," existed in the Bodenbug area. The first farm was homesteaded in 1917 by John Bodenbug. In 1935, 25 tracts were settled in the Butte area by the Matanuska Colonists, around "Camp 10" along Bodenbug Loop Road. More land was settled after World War II. Several saw mills operated between 1940 and 1970. Low housing costs, the semi-rural lifestyle, and a reasonable commute to Anchorage have supported growth in the Mat-Su Valley.<br><br>'The Butte' is a large suburban settlement. Students are bused to Palmer for middle and high school. |

|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location and Climate</b>                 | <p>The unincorporated community of Chickaloon is located within the Matanuska-Susitna Borough, northeast of the community of Sutton. Its western boundary is in the vicinity of the Kings River and its eastern boundary is in the vicinity of Purinton Creek (Between Mile 66 and 90 of the Glenn Highway). The Talkeetna Mountains lie to the northwest, and the Chugach Mountains and Matanuska River lie to the southeast. The Chickaloon River and the Kings River are the two major tributaries to the Matanuska River. There are several lakes within the area: Fish Lake, Drill Lake, Bonnie Lake, Harrison Lake, and Long Lake. Latitude 61.7967 Longitude -148.4628.</p> <p>Chickaloon falls within the transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.</p> <p><i>*Chickaloon relies on Palmer for many supplies and services. Please refer to the Palmer community profile for facilities and services.</i></p> |
| <b>History, Culture, &amp; Demographics</b> | <p>Traditionally, Chickaloon territory was a center of trade for copper, sheep, and goats from the north and salmon, beluga, and fur seals from the south. The Ahtna, and formerly the Dena'ina, Athabascans of Chickaloon traveled extensively within the Copper River and Cook Inlet areas. The Chickaloon River was named after Chief Chiklu, the last Dena'ina chief in this area. What is now the community of Chickaloon was once a primary fishing camp of Chickaloon Village. Nay'dini'aa Na' is the Ahtna name for the original settlement of Chickaloon Village on</p>                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                  | <p>the north bank above the mouth of the Chickaloon River. An 1898 army exploration party located a vein of high-quality coal near the Chickaloon River. The deposits were hard to reach, and there was little interest in them until a railroad was built to Interior Alaska. During the winter of 1913-1914, an Alaskan freighter named Jack Dalton used the frozen Matanuska River to haul the first test coal from the Chickaloon coal deposits. When construction of the Alaska Railroad was approved in 1914, the plan included a spur line to the Chickaloon coal field. From 1915 to 1922, the U.S. Navy sponsored a coal mining boom in Chickaloon drainage, which had a negative impact on Chickaloon Village, especially with respect to their once-valued fishing camp. At the same time, it provided an opportunity for jobs and the development of Chickaloon. Coal mining also took place in the area around Sutton, at the Wishbone Hill Naval Coal Reserve, Coal Creek, and Carbon Creek. Like so many other Alaska mining towns, Chickaloon grew quickly and almost as quickly declined. By 1925, the navy had halted coal development in Chickaloon, and the land reverted to public domain and was opened to homesteaders by 1958. Today, local businesses provide employment for community residents and serve the needs of residents and visitors alike. Today, local businesses provide employment for community residents and serve the needs of residents and visitors alike. Many Chickaloon Village Tribal members remain in Chickaloon, and others live in Sutton and surrounding communities.</p> <p>The tribally-owned and -operated Ya Ne Dah Ah ('Ancient Teachings') School, located in Moose Creek, serves tribal members living in Chickaloon and surrounding communities. The indigenous language is Ahtna.</p> |                                                         |
| <b><i>Economy</i></b>            | Local retail businesses and government provide the majority of employment - some positions are in the Palmer/Wasilla area, while others travel to the North Slope. Subsistence is an important activity for both native and non-native residents. There is high local interest in agricultural activities. Several guides cater to a variety of recreational activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                         |
| <b><i>Subsistence</i></b>        | Fishing, hunting, gathering, and trading are important activities for both Athabaskan and non-Native residents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                         |

| <b>Location and Climate</b>                 | Chugiak is located 21 miles north of Anchorage, along the Glenn Highway between miles and .<br>It is located between Eagle River to the south, and Eklutna to the north, and between Knik Arm to the west and the Chugach Mountains to the east. It is currently one of the main sites of suburban expansion near Anchorage, and often included as part of the Chugiak-Eagle River area. To the north are the smaller unincorporated communities of Birchwood, Peters Creek and Eklutna which are often referred to by name, but are served by the Chugiak Post Office, with Chugiak addresses. Latitude 61.3889 Longitude -149.4819 Chugiak falls within the transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.<br><i>* Chugiak relies on Anchorage for many supplies and services. Please refer to the Anchorage community profile for facilities and services.</i> |
| <b>History, Culture, &amp; Demographics</b> | The name "Chugiak" comes from a Dena'ina word meaning "place of many places". Chugiak was first heavily settled in the 1950s, primarily by former military personnel who had served in Alaska during World War II and homesteaded here. It is part of the Municipality of Anchorage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Economy</b>                              | The majority of residents commute to Anchorage or Joint Base Elmendorf Richardson.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Subsistence</b>                          | Hunting and fishing are important local activities and food sources, although most of these activities in the vicinity of Chugiak, occur in Chugach State Park or on Joint Base Elmendorf Richardson.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Location and Climate</b>                 | Located on the Kenai Peninsula, Clam Gulch lies on the Sterling Highway 24 miles south of the City of Kenai. Latitude 60.2311 Longitude - 151.3936. Clam Gulch falls within the gulf coast transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.<br><i>* Clam Gulch relies on Soldotna and Kenai for many supplies and services. Please refer to the Soldotna and City of Kenai community profile for facilities and services.</i>                                                            |
| <b>History, Culture, &amp; Demographics</b> | Reported in 1947 by Barnes and Cobb of the U.S. Geological Survey, it was named after the Clam Gulch Ravine. A post office was established in 1950. Clam Gulch is best characterized as a roadside development with a primarily non-Native population.                                                                                                                                                                                                                                                                                            |
| <b>Economy</b>                              | A post office is in Clam Gulch. The Kenai area economy provides a variety of employment opportunities. Recreational activities and tourism are an important to the local economy. Clam Gulch is visited by tourists who participate in clam digging on the beach during low tides. There is a State Recreation Area with a large campground and access to the clamming beaches. In the winter there are many 'poker runs' by snow-machine enthusiasts and in the past Clam Gulch has been the half-way point for the Tustumena 200 Sled Dog Race. |
| <b>Subsistence</b>                          | Hunting fishing (including clamming) are important local activities and food sources.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Population</b>                           | 232 (2014 Department of Labor Estimate)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### 9770.3.9 – Cohoe

| <b>COHOE</b><br><i>Pronunciation koh' hoe</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location and Climate</b>                   | Cohoe is located on the Kenai Peninsula on the west bank of the Kasilof River, 13 miles south of the City of Kenai on the Sterling Highway. Latitude 60.3680 Longitude -151.3086 Cohoe falls within the gulf coast transitional climate zone, characterized by a semi-arid atmosphere, long, cold winters, and mild summers.<br><i>*Cohoe relies on Soldotna and Kenai for many supplies and services. Please refer to the Soldotna and City of Kenai community profile for facilities and services.</i> |
| <b>History, Culture, &amp; Demographics</b>   | Victor Holm constructed a cabin in Cohoe in 1890. Holm sailed from Finland to Alaska to make his home. The cabin and many of Holm's handmade items still remain; the cabin is listed on the National Register of Historic Places. Cohoe was originally an agricultural settlement where a post office was established in 1950. Cohoe is best characterized as a roadside development.                                                                                                                    |
| <b>Economy</b>                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Subsistence</b>                            | Hunting and fishing are important local activities and food sources.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b><i>History, Culture, &amp; Demographics</i></b> | <p>Between 1848 and 1851, Russian engineer P. Doroshin found gold in the area. Cooper Landing was named for Joseph Cooper, a miner who discovered gold here in 1884. Cooper Creek was first recorded in 1898 by the U.S. Geological Survey. In 1900, the census found 21 miners and 1 wife living at Cooper Creek. The Riddiford Post Office began operations in 1924, and the Riddiford School opened in 1928. In 1938, a road was constructed to Seward. In 1948, a road to Kenai was opened, and by 1951 residents could drive to Anchorage. The Cooper Landing Community Club was first formed in 1949. The Cooper Lake Hydroelectric Facility was constructed in 1959-60. The Cooper Landing Community Club is the community's civic organization. The population of the area nearly doubles each summer to support tourism businesses and activities.</p> <p>K'Beq' Interpretive Site, cultural site, located at milepost 52.6 of the Sterling Highway, Cooper Landing, Alaska, directly across from the entrance to the Russian River Campground. Jointly managed by Chugach National Forest and Kenaitze Indian Tribe</p> |                                |
| <b><i>Economy</i></b>                              | The economy of the area is diverse. Tourism-related employment and seasonal businesses provide the majority of employment. The 86-room Kenai Princess Lodge accommodates Princess cruise ship passengers and other tourists. Chugach Electric Association and the School District are significant employers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                |
