

Map showing locations of groundwater sampling for PFOS and PFOA in 2023/ 2024

The map shows locations of groundwater sampling for two PFAS (PFOA and PFOS) in monitoring wells (marked “MW”) and some private wells (“PW”), along with the relative concentrations found in 2023/ 2024.

Williams’ sampling found PFAS in groundwater above the DEC action level of 70 parts per trillion, or nanograms per liter (ng/L), for PFOA + PFOS in some monitoring wells north of the former refinery. The DEC action level applies to groundwater and surface water used as drinking water.

Additional maps showing sampling results and indication of the plume boundary over time are available from the [Maps page](#) at the Project website.
